W. ORLANDO SMITH, of somewhere in Ohio, has received an immense amount of free advertising of late. He appears to have held a convention last month. He sent carefully printed reports of the proceedings of this convention to all the papers. The members appeared to have done nothing beyond indorsing a new fruit drier. They thought so much of it that they proposed sending cuts and descriptions free of charge to all persons who might care to look at it. The thing turns out to be a great scheme for free advertising, and nothing more. Some of our leading agricultural papers published the "proceedings," and touchingly referred to the liberality of the association. The report came here, but we saw through it at a glance. If we cannot get a report of a convention from some person whom we know to be reliable, we do not care to publish any. This incident goes to show how careless many editors become. This is an old game, and it is constantly being played. It looks as though editors are in the habit of publishing almost anything that may be sent in, without examination or comment. Such editorial management cannot breed a very extended confidence among subscribers.

THE advantages of the soiling system are now most apparent. In many dairies the cows are shrinking in their milk. The hot weather, the constant attacks from flies, and the fact that the pastures are giving out, all tend to bring about this result. Grain feeding will do much to remedy matters, but it will not do it all. Where cattle are fed green food at home, there is far less shrinkage in milk. There is no tramping over wide pastures, no thrashing through the bushes to drive away the flies, and no long journey for the herdsman at night. The cattle are always at hand in the yard. They rest in the shade during the hot part of the day, are gentle and clean, and do nothing besides making beef or milk. The soiling system involves extra work on the part of the farmer, but it is work that pays. He simply does the work that the cow expends in wandering about the pasture after food. Not the least of his compensations lies in the fact that the manure is all in one place, well sheltered and easily handled.

PROHIBITION.

WHAT is meant by prohibition? Prohibitionists are not agreed among themselves how far the interdict on intoxicants should extend. Some rest content with prohibiting the sale of distilled spirits; others would include all intoxicating beverages, such as wine, malt liquors and cider, among the drinks prescribed; while others go further and demand that not only the sale but the manufacture of all spirits, wines, ales, beers and cider shall be forbidden under the severest penalties. They claim that nothing but evil can come from the use of any of these stimulants, and that for its own protection, society is bound to strike this deadly enemy to its welfare at its source. These extremists are unquestionably the most logical; for if the sale of intoxicants is to be prevented by legislation, the policy they advocate is undoubtedly the most effective; for if the manufacture of such liquids is suppressed, the consumption of them must certainly cease; and experience in every State in which prohibition has been in force, from Maine to Kansas, leaves no doubt whatever that so long as intoxicants are manufactured, they will be consumed, in spite of the most stringent legislation. The great question that is agitating the temperance and political world just now is whether it is wiser to insist on legislation to carry out the views of the extremists, and run the risk of not obtaining it for years, if ever, or to combine with that one of the two great parties which, in its State and national platforms and legislation, shall yield most to the demands of the straight-out Prohibitionists—whether, in other words, it is better for the temperance cause to accept the acknowledged advantages of greater restraints on the sale of intoxicants, which are very likely to be obtained at once through one of the great parties; or to fight as a matter of principle for the greater advantages of total prohibition, which may never be obtained—during at least the present generation.

DISPOSAL OF SURPLUS REVENUE.

SECRETARY MANNING has always contended that the head of the Treasury Department should have full discretion in regulating the surplus in the National Treasury. The House of Representatives, however, has just passed a resolution providing that whenever the surplus, including the amount held for the redemption of greenbacks, shall exceed $100,000,000, it shall be the duty of the Secretary to apply the excess to the payment of the interest-bearing debts of the Government in sums of not less than $10,000,000 a month during the existence of the surplus. The Representatives who voted for the measure were almost exclusively from the West and South. The East, the center of capital, is bitterly opposed to it. "It is absolute repudiation," one paper says. "If it becomes a law, this country will go to the dogs," exclaims another. "It is a positive declaration of war by the Democratic party against the President," shouts a third. The trouble is that there is fear that the vast pile of silver dollars in the Treasury may in this way be forced into circulation, and the East is against silver, while the West and South are in favor of it. Again, the amount of the circulating medium will be increased, and capital is opposed to this, as its own value is enhanced by a scarcity of money among the people. While the resolution received its principal support from the Democrats, 64 Republicans voted for it and only 51 against it, so that it is in no sense a party measure. Moreover, according to the latest accounts, the Republican Senate is likely to pass it, as great pressure is being brought to bear on Western Senators to vote for it. It is thought the President will veto it; but that is yet a mere assumption. The surplus available for the purpose on July 1, was $75,191,109.95, and no financial disturbance should arise unless gold should ever again sell at a premium. So much needless excitement about this matter is manifested in the papers that it is well that our readers should have clear information about it.

THE RURAL'S METHOD OF IMPROVING CORN.

ALLOWING the pollen from barren corn plants to pollenate the silks of fertile plants is much the same, perhaps, as placing a poor scrub bull among a herd of good cows. If we wish to prevent a given kind of corn from suckering, we plant year after year the seeds only of the plants which do not sucker. The suckering propensities will be overcome in time. We can show one example of this, though 10 years have been required to effect the change. If we desire that a given kind of corn should bear its ears lower, we select the seeds of such plants. And so selections should be made to change corn in any other respect. If it is desired to increase the productiveness of corn, it is not sufficient that the best ears should be selected; the parentage also must be looked to. Sterile plants ripen more pollen than fertile ones. The tassels are larger. As, in the majority of cases, a given corn plant is not fertilized by its own pollen, it is just as likely to receive the pollen of sterile as of fertile plants. Hence it is that though we select the best ears, they may have been sired by sterile plants, and the effect will certainly appear in the progeny. It is about impracticable for the farmer to go over a large field and cut off all the tassels of plants which bear no sets. No better method occurs to us than the one we have often recommended to our friends, viz., growing a little patch by itself, as far as possible removed from other corn. In this little plot all tassels of faulty plants may be cut off, and, if necessary, the tassels of approved plants may be selected from the main field and shaken over the silks (pistils) of the best plants of the isolated plot. It is too late to plant the special plot now, but it is not too late for the grower to select a corner of his field as the best substitute for thus improving his seed corn for another year. We have practiced this plot system of improving corn for 10 years or more, and we propose to continue it as long as we live. The changes wrought are now very marked, and there is no other experiment at the Rural Grounds which interests our farmer-visitors more.

LEGITIMATE AND ILLEGITIMATE MIDDLEMEN.

LEGITIMATE middlemen and speculators are often confounded by producers and consumers in their denunciations of the intermediaries who unduly lower the price of products for the former and raise them for the latter. The distinction between the two is plain, however. In legitimate trade it is possible for both parties to make a profit; in a speculative deal one must lose at least as much as the other makes. The legitimate middleman adds to the value of the property or promotes public convenience; the speculator does neither, and if he wins he gives no equivalent for his gains. The grain merchant buys from a number of farmers their little stores and makes up a shipment for some large distributing center on better terms than a single producer could obtain. The exporter engages freight, handles the grain for shipment and secures a market beyond the ocean. In these transactions the measurers, inspectors, carriers and ship-owners fairly earn their support out of the moving produce. Or, if the grain is to be turned into flour, the middleman, through several agencies, collects it from the farmers, and delivers it to the miller. The latter cannot wait on small customers, and has to sell his products in large lots; the jobber divides it among the retailers and the latter sell it by the barrel or bag, or even by the pound. Each of these middlemen adds to the value of the article by relieving the producer of much trouble in marketing his raw material, and by bringing the finished product within the convenience of the consumer. Again, most of the middlemen collect a variety of needed supplies together, so that a customer, instead of visiting 15 or 20 different stores for as many different articles, can find them all in one. This, as in the case of the grocery or dry goods store, saves much time to the customer, and justly entitles the store-keeper to a percentage of profit. The tendency of late has been to increase this condensation, so that the multitude of goods which could formerly be found only in a dozen different stores, can now be often bought under the same roof. Should this continue, the number of middlemen who now handle the conveniences, comforts or necessaries of life and live on the tolls these pay as they pass through their hands, must be greatly diminished. The number now is, no doubt, very much too large, and many of them unquestionably exact too heavy a toll, still the great body of them are engaged in a legitimate occupation and are justly entitled to their earnings. The speculators are the "leeches" who suck the blood alike from producer and customer, and give nothing in exchange to either. They hold no legitimate place in the line between the two. They add nothing to the value of the property, nor do they promote public convenience. They are simply gamblers and mischief-makers, who keep the markets in a ferment with the view of making an illegitimate gain in the confusion. They are specially busy now, and will continue so while the crops are moving to market, reaping where they have not sown, and gathering where they have not strewed, accumulating fortunes simply from the labors of others. No form of denunciation is too severe for these leeches on the body politic.

BREVITIES.

THE "School Board" in the Bear Creek District selected a teacher as described in our Youth's Department. Do you know of any district where teachers are selected as he was?

READ Mrs. Story's article on the next page—you who would have your children remain on the farm and love farm life. Do not fail, good parents, we say, to read it, and read it carefully.

IF you intend to bag grapes, delay no longer. The chief object is to preserve the bloom and to protect them against the birds. We do not find that bagging is any protection against mildew or rot.

MR. J. T. LOVETT (New Jersey) writes us that he wishes that the Japan Chestnut did not have such a bitter skin. It is a bother, he says, to take it off, and the flesh is not good unless you do—too much like an acorn.

WE learn that the new yellow raspberry, Golden Queen—a seedling of Cuthbert—is this season larger than the Shaffer, very productive and a strong grower, while the fruit is simply beautiful. Our plants do not fruit this year.

EARLY Cluster Blackberry began to ripen at the R. G. July 12. It ripens before Wilson Jr. and Kittatinny, and is of value for this reason. It bears lots of berries of medium size, jet black and of fair quality. They are irregular as to size and shape.

ARE the merits of rye as a green manure really so insignificant as the article elsewhere in this issue indicates? Rye has always been highly commended for "turning under." Will its supposed advantages really stand the test of close observation, or had the season anything in particular to do with its failure in this instance?

ISN'T too much importance often given to the results of a single season's experiments in agriculture or horticulture? "The only thing that's certain, is the uncertainty of all things," is an old saying which seems specially applicable to the outcome of a single set of experiments, even when conducted with the most careful precautions to exclude all extraneous influences. What is said about "Plot Experiments" elsewhere forcibly illustrates this point.

A FRIEND writes us that he wishes that the agricultural papers would ventilate our experiment stations more than they do. They should speak out clearly against their faults, with suggestions for improvement. They should dissect and digest their work more than they do. He fears a fungus growth is slowly stealing over some of them already, because the public does not stir them up enough.

Educational.

HOW SHALL WE EDUCATE OUR CHILDREN AGRICULTURALLY?

ADELINE E. STORY.

What prevents farmers' sons from following their fathers' calling; if the fathers are content, the children are likely to be; drawbacks to farm life; overwork; need of studying a boy's "bent," and a girl's reasonable desires; the question of dress for both; why farmers should be proud of their calling; give the youngsters a chance to learn something; give them pleasures; wake in them an interest in farm work; social entertainments; a happy home the right end of all endeavors.

WHEN we consider how many of our young people annually forsake the farm for a life in the city, the question of education with a view to forestalling this tendency becomes of importance. Naturally a boy should follow the calling of his father. That the sons of farmers so exceptionally often refuse to do so, shows conclusively that there must be something wrong. What is this something? Is it an inherent feeling peculiar to the nature of the country-born child? Is it that farm life affords fewer opportunities for enjoyment than life elsewhere, or is it the outgrowth of a wrong system of training?

Education with the child begins the moment he is old enough to take notice of what is going on around him. His future course in life as well as his success in it must depend largely upon the training he receives. A parent's first duty, after providing for the health and comfort of his child, is to seek to promote, by every means in his power, its present and future happiness and usefulness. Do we, as farmers, desire that our children, in making choice of a way of living, should choose our way? Then must they be made to see by our actions that we believe it to be the best way. We cannot expect our boys and girls to see benefit in a course of life which we ourselves are for ever grumbling about. But we must be more than content with our calling. We must be in love with it. It is not enough that our children are born to farm life simply. They must be born into an atmosphere of love for it. They will be much more easily taught contentment if made to see that they have everything to be contented with.

Then, too, if a farmer is enthusiastically in love with his business, he will be pretty certain to make a success of it, and here he will find another and a strong incentive to his children to become farmers, for even young children are not slow to see the advantage of having plenty of money; and if their father has less of it, or less of the comforts it brings, than the man who keeps the corner grocery, then the natural conclusion is that it would be better to sell the farm and buy a corner grocery. As a rule, there is too much work and too little play on the farm. It is not that the work is too hard, or that in itself it is more disagreeable than work in general; but it is more constant—is begun earlier in the morning and kept up later at night. Then there is too little notice taken of *how* the work is done, provided the young workers merely keep going, and that acts as a damper on any little pride they might take in doing it well. Then boys are too often set to work alone, and isolation is a thing not relished by the young. The prospect of something pleasant to come, say at the close of each day, might help to quell many a feeling of discontent; but instead of rest and recreation, what does the night bring? First chores, then chores, then again chores! Many a farmer owes his son's leaving the old home, to struggle against the temptations of a life for which he is unprepared, to chores alone. Not that they need be so dreadful if rightly managed, but when left to be done by the boy who has worked in the field till it is almost dark, they loom up between him and any little pleasure he may have had for the evening, like a mountain of difficulty. It is doubtful if any one thing tends so much to the general discontent which prevails in so many country homes as this system of over-work which requires the doing of so much after a big day's work has already been "put in."

An exacting, abide-by-my-rule father may take it into his head to give his son a love for agricultural pursuits by sending him to an agricultural college. He will come back at the end of his course and tell you that he likes it all well enough as he saw it there, and in the next breath he will ask you if you happen to know where he would be likely to find a situation as clerk or bookkeeper. You, sir, made him hate farming when he was but a boy, and all the agricultural colleges in the world—excellent and every way worthy though they may be—would fail to make him like it.

Suppose you had brought him up differently? Suppose you had studied his "bent," as every parent is in duty bound to do? You might have found that in some special branch of husbandry he would have taken right hold. Did he show a particular liking for horses? If so, you missed it in not giving him the care of the horses. Or was a fat heifer or steer the perfection of beauty in his eyes? Then, sir, you were wrong not to give him some latitude in that direction. Did he delight in fields of waving grain? Then you should have done your utmost to make him feel an interest in every acre of grain grown on the place. Was he fond of trying little experiments to test this or that? If so, you made your widest miss when you failed to encourage him there. Was he in the habit of offering suggestions when you were at work together? You know he was, and you made fun of them always and pooh-poohed at him for his pains. In short, you threw cold water on every little scheme of his which, if not so chilled out of existence, might have made a farmer of him, and a better farmer, too, than you ever were.

His sister left the farm a good while ago to go to town and become a dressmaker. You do not know where she is now, though you wish you did. But there are some things you do know if you have a good memory. You know she was what you would call a home girl. She always liked best to be at home until you drove her away by your selfishness and want of sympathy. You know, if you will think about it, that you never tried to make her young life bright or happy. You know there were several things which she particularly wanted to have, things you could well enough afford, things which most of her associates possessed, but which you would not get for her—not you! She wanted a magazine, a croquet set and an organ. She wanted the house yard enlarged so she could have a flower-bed or two, and do you remember the little heifer calf she wanted? You gave her that, you know, because it was a weakling, and you knew she would tend it well. She did tend it, and when it stood among the two-year-olds, the sleekest and best-built of them all, you sold it for a round sum and pocketed the money!

Had this man been wiser he might so have trained and led his children that they would have counted it happiness to follow in his footsteps; but driving suited him best. He tried it and failed.

Life is made up of little things. This is especially the case with the young. It is the little things taken one with another that bring to them either content or disaffection. Good clothes to wear, pleasant society to enjoy, a comfortable home and surroundings, a neatly-kept room to which one may feel at liberty to invite a friend without the fear of a frown from mother or a black look from father—these things go a long way with many young people; and just here, in the matter of dress, a wise parent may find a golden opportunity for setting a young girl's face in the right direction by teaching her to discriminate between a tailor-made man and one made by the Almighty.

It is a pitiable sight to see a modest, and in most respects sensible country girl preferring a dude of a fellow from behind somebody's counter to the manly and every way worthy son of her neighbor, whom she really likes, but who, in the matter of dress, cannot "hold a candle" to the dude.

And here let me say that the boys have more to complain of in the way of dress than the girls. The latter can make over and in many ways so alter the appearance of their dresses that they seem to have more changes than they really have. A boy has seldom more than two suits, one to work in and one for "best." Now if, when he has occasion to go from home—say to town—on a week day, he wears his work suit, he is more than likely to display a few patches, and there is no mistake about it, a patch on a boy's pantaloons makes him feel meaner than two holes that need patching. If, on the other hand, he wears his best, he will feel like a simpleton. A suit, then, to correspond with the business suits worn by the young men about town is what his self-respect demands. Are these things of small account? Certainly not, if they help to make our children satisfied and contented with their lot in life.

Farmers should so train up their sons and daughters as to make them proud of their calling. First, because of its independence, its freedom from the petty annoyances that beset the great class of individuals who live, and who, in the order of things must live, from hand to mouth. Because of its freedom from temptation. Because it is the most important one in the world, the one which forms the basis of all others. Because it promises a surer living, with better health and greater freedom from care than any or all others. They should be encouraged to take pride in, to feel a sort of ownership in everything about the place—the orchard, the shade trees, the shrubbery, and as they will naturally feel most interested in what they have helped to produce, get them to help in the tree planting and let them, once in a while, choose the place and the tree to plant. As to the live stock, they seem to take to that naturally. I have yet to see the boy or girl to whom the coming of the lambs, or the calves, or the colts did not bring a genuine joy, and it is an act of wisdom on the farmer's part to make his children an occasional gift of one or another of these animals. But let it be a *bona fide* gift. Let it be theirs to sell or to keep.

An excellent plan to awaken and keep alive a boy's interest in operations of the farm—and without an interest on his part, the farm will hold him only till he sees his chance to get away from it—is to give to him a piece of ground to cultivate just as he likes, and for himself.

Said a farmer of my acquaintance to his son:—"Time was when that back lot would pay the taxes on the farm, but it won't do it this year. It is about run out." "May I have all I can get off of it above the taxes, father?" Consent was given, and the 16-year-old boy went to work. He bought manure and hauled it on to the land. He got the ground in good order and planted it to corn. When the corn was gathered he took hogs of a drover to fatten "on shares." He paid the taxes and had enough money left to pay them twice over again.

A wide-awake boy will not feel satisfied anywhere unless he feels that he is learning something. He should be given a good reason for every farm operation that comes under his eye. Many a young man leaves the farm because he has been suffered to grow up without the knowledge of the inner workings of the business beyond what he can guess at. He is conscious of his ignorance and goes to find something easier to master. Whenever it is possible children should be given work suited to their tastes. One boy might like nothing better than to spread manure from morning till night, day after day, while another would rebel at once, but would be quite willing to set cions in the orchard or plant out the young trees. Of course it would be a mistake to let the former do the grafting and make the latter spread manure. Such a course persistently followed would be almost certain to result in both boys having a distaste for farm work.

We should seek then to make our children happy and contented as well as useful. We should try to make our children wise above the wisdom which shows itself only in the cut of a coat or the looping of an overskirt. We should encourage them by giving praise when praise is due. We should give more holidays and have fewer days in which extra work must be done. We should provide an unexpected pleasure now and then, that will tide them over many stony places. They should be allowed liberty above that of an hireling. We should strive in all things wherein our children are concerned, to act the part of a wise person who has a great interest at stake. We should not be stingy with our children. If we are, and they have not lost respect for us, they will lay the blame of our parsimoniousness on our way of living, and so be brought to despise it. We should be progressive, always on the lookout for the very best means in husbandry. Thus our children will find one direction at least in which there may be ample scope for brains on the farm.

In talking to children it is not a good plan to always say *I*. If we only could say *we* occasionally we should find them more drawn towards us and our work.

"Well, Johnny, shall we try the plow today?" says a farmer to his little three-year-old son. They go, and Johnny, who trots along behind in the furrow, really seems to take as deep an interest in the turning of it square and straight as does his sire, because he feels that he is, somehow, helping to do it. A good way of creating an interest in farm affairs among the young people has been found in letting them take turns of a week about in "managing." This works as well indoors as out. The boys will vie with each other, not only in getting the greatest possible amount done, but in doing it in good style and "just as father would like," while the girls will do their best to convince you that they can not only attend to the milk and make the butter, but that they can make beds and keep the house in order as well.

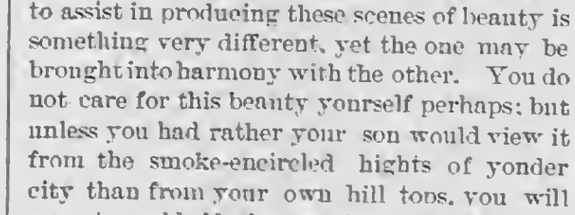
The tendency of the age is toward a higher education. Among native-born Americans a tolerable degree of learning is now the rule, and ignorance the exception. The time when a farmer might hope to keep his son on the farm by keeping him in ignorance has gone by. At the present day a young man feeling his lack in this respect would be likely to attribute it to the mode of life he had been nurtured in, and lose no time in getting away from it. And since we must all mingle more or less with the people among whom our lot is cast, and it is not in human nature for a man or woman of education or culture to live contentedly in a community of boors, it is every man's duty not only to give his children the best advantages in the way of schooling within his power, but to encourage his neighbors to do the same.

The social element in our nature must also be provided for. If young people find no amusement or entertainment aside from what they find in the nearest town, it follows that they will soon come to prefer the town to the country as a place of living. The Grange is a good place for the farmer not to *send* but to *take* his sons and daughters to, for, aside from its social advantages, their minds become familiarized, through the discussions held there, with various farm topics, and are thus led into sympathy and harmony with them. Then, neighborhood entertainments of a social and literary character should be encouraged. Reading clubs, singing classes and debating societies, if properly conducted, are excellent both socially and educationally. Games may be made a pleasant past-time for an evening at home, but they should be indulged in only occasionally, as at best they afford but idle amusement. The hours between supper and bed-time had much better be spent in reading, with now and then music for enlivenment, than in playing checkers or back-gammon.

Is your daughter of a romantic turn of mind? Then look well to her training; teach her to make herself useful at home first, and after that, in whatever good work the neighborhood may be engaged in. See that she has healthy reading, not such as is circulated to feed the sickly sentimentality that is spoiling her by unfitting her for all domestic duties. Does she long for society, as she imagines it to exist away beyond the stretch of field and farm? If so, happy are you if out of your broader knowledge you are able to show her what bitter struggles for place, what strivings after appearances, what coverings up and shieldings of weakness and sin, what emptiness, what hate, what vice lurk in and poison the atmosphere of the society she covets.

Does your son incline to be "poetical," as you are pleased to call it, rather that practical. Then be wise for yourself and him before it is too late. It is one thing to admire the works of Nature—the green fields, the vine-clad slope, the grazing kine—to be willing to labor, to assist in producing these scenes of beauty is something very different, yet the one may be brought into harmony with the other. You do not care for this beauty yourself perhaps; but unless you had rather your son would view it from the smoke-encircled hights of yonder city than from your own hill tops, you will cease to scold if the work stands still for a minute or two now and then while he watches a cloud shadow creep over the green wheat, or gazes at the summer sunset. Is your son ambitious, rejoice at it, providing his ambition is of a kind calculated to result in his best good; if not seek to make it so.

The desire to get on in the world, to surround one's self with the creature comforts necessary to happiness, to possess even of the luxuries of life should be strong in the breast of every tiller of the soil. He has health and strength. The free, pure air of heaven is his to breathe. Beautiful creations fresh from the hand of God are spread out before him. But these things should not satisfy him. He should seek to make his home a bower of love and beauty—flowers, birds and sunshine around it, within the peace and content which comes of a consciousness of making the highest use of the blessings God has given us.



There's another scheme to get money out of imaginary heirs to a great property in this city. At present it is being "worked" chiefly in the West, and the stake is an estate here valued all the way from $300,000,000 to $400,000,000. The property is alleged to be chiefly around Mercer Street, a poor street just west of Broadway. There it covers about 100 acres, and there's some more in Jersey. It was owned by Moses Mercer, a Scotchman, in 1750, and was leased for 99 years. The lease having expired some years ago, the "heirs" of old Mercer are invited to contribute funds to recover the property before the courts. It is said that several Western men of sense and standing have joined in the enterprise, but as the Vanderbilts and Astors own most of the N. Y. property now, claimants will have a hard job to wrest it from them.

TO SEVERAL INQUIRERS.—We do not recommend the nostrums of the Civiale Remedial

Agency of this city: or of Dr. A. Redsyn, Ilion, N. Y., nor do we recommend C. H. Harris, of Lawrence, Ind. In all cases where the medicines offered by these people are needed, it would be much safer, more economical and in every way wiser to consult a good local doctor; or, if this is objectionable, to visit a respectable practitioner in a neighboring town. ..We don't recommend the Crescent Art Co., or the Oriental M'f'g Co. of Boston, or J. F. Hill, of Augusta, Me. People by working for them often make a little money; but there is by far too great a risk of dissatisfaction and just grounds of complaint for us to recommend them..... We have never heard any complaints of Dr. W. H. Parker, of the Peabody Medical Institute of Boston, or of his manner of treatment..... ..We cannot recommend the Popular Monthly, Kansas City, Mo.....The Sherwood Novelty harness gives satisfaction, so far as we have heard of it. Mr. J. S. Woodward recommends it from personal experience.....We have nothing special to say against investment in Lakenwild lots near Bangor, Me. We wouldn't settle there ourselves, except, perhaps, for a summer vacation; but there doesn't seem to be anything fraudulent about the effort being made to secure purchasers of land there—and there's no accounting for tastes....Samuel Z. Cooper is the name given by a fellow who is traveling round the country selling a "corn, bunion and wart preparation." He is also selling what he calls "Death on Rats." He claims to be working for the Soldiers' Home, Dayton, Ohio. That institution stigmatizes him as an impostor. He was formerly connected with it, but was discharged for good reasons over a year ago. ... For the standing of the various mutual-benefit insurance associations in the different States, apply to the Insurance Superintendents at the capitals of the various States. It is altogether out of the question for us to "keep the run" of such institutions.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

THE SCARECROW.

In yonder field he stands erect,
No matter what the weather,
And keeps a watch so circumspect
On foes of every feather.
So faithful is he to the trust
Committed to his keeping
That all the birds suspect he must
Dispense with any sleeping.

Sometimes his hat tips down so low
It seems a cause for censure,
For then some old courageous crow
Believes it safe to venture;
But catching sight of either arm
Outstretched in solemn warning,
The crow decides to leave this farm
Until another morning.

Although his dress is incomplete,
It really does not matter;
Perchance the truest heart may beat
Beneath a patch or tatter.
And it is wrong to base our love
On wealth and name and station,
For he who will may rise above
His daily occupation.

We should not look with eyes of scorn,
And find in him no beauty
Who stands and guards our fields of corn,
And does the whole world duty,
But honor him for native worth,
For rustic independence,
And send a hearty greeting forth
For him and his descendants.

—*Harper's Young People.*

OF INTEREST TO WOMEN.

MANY a tired housewife will read with a sigh of personal application the epitaph seen on an old Surrey tombstone:

Here lies a poor woman who always was tired,
For she lived in a world where too much was required;
"Don't weep for me, friends" (thus she said), "for I'm going
To where there's no reading nor writing nor sewing;
Do not weep for me, friends, for when life's thread shall sever,
I'm going to do nothing for ever and ever."

The manifold complexities of modern city houses have called into being a new trade, says Lippincott's, that of the universal tinker. Now, with an extension of the same idea into the woman's kingdom, a correspondent sighs for a neighborhood darner. Most of us would agree as to the convenience; but the correspondent was not, perhaps, aware that the system recommended is in practical operation in Paris. In the family where our home was when there, punctually one day in the week came la raccommodeuse, and, having been established in a back room and given a cup of coffee, set to work on the ruin three children and an impatient man had wrought. She had for her pains her meals and twenty cents a day; and she had a clientele of nearly a dozen families, from whom she drew occasionally something beyond the daily franc. To some she gave but half a day; but matters were so systematized that she was rarely without work. Very convenient the American boarder found her for the ripping and cleaning of old gowns and the darning of hose, which, in her devotion to the monuments of Paris, she had no time to touch.

Since the reign of bric-a-brac set in we have professional dusters in the cities. It should be comparitively simple to introduce also professional menders. Perhaps a difficulty would arise as to the amount of payment, since the women who mend for their familes do not roll in wealth, and even 50 cents a day might seem to them extravagance. And the sewing woman who drags her life out on the same sum, boarding herself would probably scorn less. But, once given her patrons, she might find her life both easier and more healthful; and the tired housemothers, seeing the economy and the relief, would wonder why they did not do it before. Under the present system the thrifty women fret and tire themselves over the endless task; the sentimentally philanthopic and the unthrifty give away, to the increase of poverty often; and the old clo's men profit by the improvidence of the bachelors and husbands.

A little more co-operation everywhere would lighten women's work. Here, for instance, in a town of 2,000 inhabitants, one woman for years made her pin-money by the weekly brewing of yeast for her neighbors. She has gone out of the business now, her husband objecting; and the women are left lamenting the lost convenience. Yeast in plenty at the grocery—patent yeast; but they all prefer the home-made when they can get it. So, could they once get it, they would prefer the neighborhood mender.

A WOMAN'S RIGHT.

NOT a political right, by any means. Simply the right to life, liberty, and the pursuit of happiness in the path clearly assigned her; throwing aside, perhaps, the swaddling bands of conventionality, but never forgetting that the virtues which made a good woman priceless above rubies in Solomon's time are as valuable now. Solomon's virtuous woman is a type to be loved and honored now as then. She not only worked for her home and her household—she made her husband honored among men; seated at the gate with the elders. The wisest of men always shows intense appreciation of prudence and good sense in women—poor man! he probably had experience enough of the opposite in his too polygamous household.

Considering how few of us, men or women, are called to things the world considers great it seems the only true life is to live according to our highest and best, in the seemingly trivial round of every-day life. "A little leaven leaveneth the whole lump;" how can we tell that these things are trivial? It may not seem that dish-washing, and sweeping, and dusting, and cooking is doing the greatest amount of good for the greatest number in our power, but who knows? If great things are expected of us, the opportunity will surely come.

But we must not sink into mere anxious Marthas, cumbered with many cares—too anxious, like the Sister of Mary, to hear the Divine voice offering us wisdom and peace. The incentive to higher and better aims has always come from women; sad, indeed, would it be if we lose our power of inspiration through loss of the higher voice within ourselves. Purity and simplicity of mind in ourselves must ever awake it in others. Have you not noticed how a person of single mind and profound truthfulness, however unassuming, always affects others, driving away deceptions, like the summer mist before a powerful sun? Some cynical writer speaks of the danger incurred when a thinker is let loose upon the world. Danger? Yes, to the dark places among highways and hedges—to oppression and wickedness in high places. But there is danger to all these things when one simple woman takes it into her head that it is her duty to right whatever wrong lies in her power. A woman with one fixed idea, and that a good one, is likely to become a power, whether she be buried alive in an isolated farmhouse, or one of the toiling thousands in a great city. Nor will she ever know how much her thought and deed will influence this busy world. The modest woman who wrote from the fullness of her heart in the intervals of daily duties little thought she would create a living book to be the watchword of a great struggle—the evangel of that power which brought freedom to our slaves.

Do always the duty that lies nearest you—if you are faithful over small things you will surely be faithful over great. With truth and purity, high aims and faithful duty, our lives will leave their impress on heart and mind, until our little grain of mustard seed becomes a great and spreading tree.

OUR BROTHERS.

LET us begin at the beginning, at the first advent of the average boy on the world's stage. There he lies in his little crib, feebly squaring off with his tiny red fists at the world in general, and, at all times when we have been able to study him giving decidedly audible testimony as to the vigor of his lungs. A few years pass by and he becomes that object of terror to nervous people and old bachelors, the small boy. Probably at no time is he an object of greater anxiety to his affectionate relatives, not only from his cheerful disregard of personal risk, and general destructiveness, but also from his appalling candor. These awful qualities are the general characteristics of boys between six and fourteen—even the immortal Father of his Country was not exempt from them, as a certain little oft related moral fiction shows. At this interesting period of his life, a fondness for fishing and circuses, an intense appreciation of a life on the ocean wave, and an admiration of pirates and Indian fighters, forms the basis of his character. His appreciation of the fair sex is decidedly limited. We would not say he considers his own sisters and other boys sisters too, decided nuisances, but he has that half-contemptuous toleration for the sex in general that in later years he only shows toward his own feminine relatives. But the most critical period of his life is a few years later, when he ceases to look upon a Piccadilly collar as a relic of barbarism, becomes very particular as to his neckties, and, most momentous event of all, begins to raise a moustache. We believe that at this period he usually experiences a lofty adoration for some lovely being of the opposite sex, but as we cannot speak from personal experience, we will let this point pass. Notwithstanding their many weaknesses, brothers are very handy at this period of their existence. They are usually available on escort duty, and can be made useful in a variety of ways.

We make an anxious pause before beginning this next branch of our discourse. We want to say something about the most prominent faults our brothers possess. Let us at least give just a few words of advice, which, of course, will not be taken, as it is perfectly disinterested; and disinterested advice, as we all know, is from someone who knows nothing whatever about the matter. Don't praise up other girls to your sisters for the very qualities you believe your own sisters to be most deficient in. Don't talk to your sisters, because they happen to be girls, as if they didn't know as much as you do, and more too, perhaps.

We need hardly allude to the only universal woman's right allowed by man, that of "ladies first." As one cynical philosopher observes (let us hope he has no sisters.) "Who is it who has the first seat in the cars, the boats, the theatres? who is it who must be cared for, waited on, and dressed like Solomon in all his glory? Why, the ladies. Who is it who pays for all this? Man, the brute!"

Let us end with the toast—"Our Brother's." They halve our joys, double our sorrows, are the joy of one-half of our existence and the torment of the other—they are a joy forever when rightly managed, and a snare and delusion when they want to be—a silken thread will lead them, when you couldn't drive them with a chain cable—a well spring of delight in a house, who would'nt have them?

GOLDEN GRAINS.

IT is as true now as in the days of Johnson that money and time are the heaviest burdens of life, and the unhappiest of all mortals are those who have more of either than they know how to use.....

WHAT did Emerson mean when he said, "God himself does not speak prose, but communicates with us by hints, omens, inference and dark resemblances in objects lying all around us".....

GOD will do whatever He pleases; and what pleases Him ought to please us. It is above nature, it is contrary to nature to make full surrender of ourselves to His sovereign and absolute will. Grace alone can enable us to say from the heart, "Thy will be done.".....

IN one of the manifestos just issued in England, we find this unique sentence: "The voice of the people is the voice of God, and, therefore, the voice of freedom, justice, and right,".....

IN an insurance exchange we find this beautiful sentence: "All the revelations of nature may be regarded as the oil which feeds the flame of thought, burning continually in the secret shrine of man's mind; and countless affinities, mental, earthly and spiritual, verify the saying of the Greek poet

'O, earth, earth!
How art thou interwoven with that nature that first came from thee.' ".....

FOR, as so beautifully expressed by Pope,

"All are parts of one stupendous whole,—
Whose body Nature is, and God the soul," .....

THE more we know of God, the more we shall desire to resemble Him in holiness. Whoever truly loves another, will desire to be like the person he loves, and to do what that person likes..... ....

THE Tabernacle, London, Dr. Spurgeon's, has a membership of 5,214.....

FRANKLIN spoke doubtless from experience when he said, "A cheerful face is nearly as good for an invalid as healthy weather."....

BISHOP WILSON truly says, "A root that produces nothing is dead. Faith is the root of all good works.". ....

VICTOR HUGO, speaking from an entirely different stand-point, says: "Let us fear the worst, but work with faith; the best will always take care of itself." ... .

BITTER and untruthful words, instead of injuring the one at whom they are aimed, are very likely to rise up, perhaps after many years, in condemnation of him who gave them voice ....

WHILE we cannot be too particular about the daily observance of family worship, yet it sometimes conflicts with the good wife's culinary arrangement. One morning, when the husband's prayer was longer drawn out than usual, a suspicious smell of over-done biscuits was wafted slowly but surely toward the wife's olfactory organs. She wriggled and twisted, thinking of her biscuits, and at last, when the husband started off on a new tack, to which there seemed no end, she startled the good man by saying: "Lord! John, cut it short; I've bread in the oven."..... ....

THERE are a great many persons who never rise above the medium line of feeling. They are not excitable. They are not in anything enthusiastic. They appreciate the truth and they mean to obey it, and to conform their lives to the principles and commands of God; but it is not their nature to overflow with mere feeling . . ..

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOUSE-KEEPING IN CALIFORNIA.—XI.

MARY-WAGER FISHER.

A PECULIARITY of California houses—and the same is true of those in Washington and Oregon—is the way in which the occupant's name is put on. It is no uncommon thing to see it painted in large letters (which you can read distinctly across the street) on the window above the front door. To the new-comer it has a disreputable look; but one soon becomes accustomed to it, and recognizes its convenience.

The beautiful way in which the grounds about houses are kept is apt to make the admiring visitor feel that it must be easier to have fine grounds in California than elsewhere. But this is not altogether true. In Oakland, for example, there is hardly an ill-kept place in the city. The yards are not large, but so beautifully cared for, the grass being so even and green, and the flowers and shrubs in such perfect order, that everybody is necessitated, by the examples all around him, to keep his own domain in like manner. But in order to preserve this year-all-around beauty, eternal vigilance, water, pruning, tying plants to stakes, and the lawn mower are all needed. The grass plots between the sidewalks and the streets are mainly kept in the same way.

Although the sun is so essential to warmth and health, there seem to be just as many women here as elsewhere who shut the sun out with blinds and shades, presumably to save the color in carpets and the furniture. I never yet lived in a house where I had full sway into which I did not court all the sunshine to be had. As to furniture, I think most people are "idiotic." Take chairs and sofas, for example: either to be comfortable, should conform in shape to the outline of the body. The stuffed chair is convex in its seat, when it should be concave—exactly the opposite to what it should be—and still women go on generation after generation buying such monstrosities. I am very partial to a luxurious seat, but I detest upholstered things. They absorb dust, and to me never seem clean. Now-a days there seems to be no excuse for upholstered goods, as there are so many pretty chairs of bamboo, wicker, and honest wood with backs and bottoms of yielding material that can be beautified with cushions and quilted work.

I am reminded of this every time I dust the red stuffed chairs in our cottage here—and I flourish a whisk and dust cloth with mental irateness at the existence of such things. The one wicker chair in the room forms almost a cause for family feud—only the fact of possession is fully recognized as being nine-tenths of the law. Of course, as long as people buy ill-

adapted furniture, just so long manufacturers will feed the demand. But manufacturers are quick to respond to the requirements of the public. I chanced to visit a furniture manufactory on this coast, and one of the proprietors evidently desired some expression of commendation for his styles, which were simply atrocious, although, of course, I could not say so. However, I did venture to ask him why he left the corners of foot-boards of bed-steads and covers of wash-stands and bureaus and other things square, as such angles often result in great mischief. He confessed that it had not occurred to him to modify the sharpness of the corners, but he thought well of the idea. His very elaborate pieces of furniture he was particularly proud of, in proportion as they would require the greater time to keep the nooks free from dust. The furniture that most of us require needs to be plain, with rounded corners, well and gracefully shaped and easily kept clean. Most California housekeepers as yet, have the old-fashioned disdain for things of American manufacture. Take pottery, for instance. One may go into almost any shop and ask for American china, and the clerk will tell you in a pompous way, that they only keep English wares, when he knows very well, or should know, that with the exception of China, there are as fine china and porcelain made in the United States as in England or the world, and the only line in which China excels all countries is in the application of color. The finest kaolin for porcelain in the world, is found in Indiana, and in Missouri there are extensive beds of pure white silicon, naturally prepared for use. I have seen as beautiful china and porcelain made in Trenton, N. J., and at Green Point, Long Island, as any made in England. The pottery works in Cincinnati turn out some lovely things, and the richest woman in Ohio, Mrs. Nicholls, with an income of $200,000, works daily in her pottery there, which also gives employment to many artistic women.

One day a nice-looking youngish woman called at our cottage as an agent for a sewing machine. She said it was the first work she had been able to procure in California, where she found the avenues of employment for women much fewer than in the East. She had worked at dressmaking in St. Louis, but her health would not permit her to continue to sew and she came to this coast. I asked her why she didn't try housework—women received such generous wages, from $25 to $35 a month with board and lodging. "Oh you are such a prisoner at housework! and then too, the women of this coast don't know how to treat a domestic—they are not like Eastern women." I did not believe the final remark to be true—but I thought I had rather do housework for $15 a month, than to go about from house to house trying to sell sewing machines or anything else for double that salary.

A CONVENIENT KITCHEN TABLE.

FIG. 302 shows a table that was made out of a common bureau with drawers, by putting on a heavy pine top with leaf at back. The drawers do not take up any extra room, and

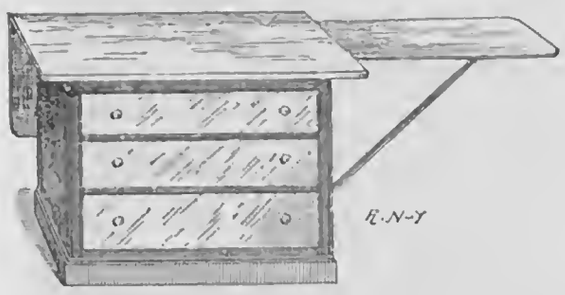


Fig. 302.

will be found convenient for many things. A skirt board can be attached at one end which when not in use can be let down or slid under the top. The board is held in place by a brace. F. W. WHITNEY.

KITCHEN TALKS.

ANNIE L. JACK.

WE have a little girl staying with us who has never had an opportunity to learn any of the details of housework. Her mother died in her childhood, and her crude ideas caught from school companions were that work was beneath her, and that she had no need to learn how to do the thousand and one things that the best housekeepers find necessary. "My Pa doesn't work, he writes," she said to our little ones, who are always proud of helping their father in whatever work he undertakes that is not beyond their strength. Of course her father worked in an office, and she did not understand any better, but was a victim to the pernicious teaching that despises manual labor. Slowly she is learning that bread and butter are made by someone's toil; that a housekeeper's *duty* is to attend to her household, and that little feet and hands must, unsolicited, be ready and willing to assist older people.

"I like to stand at the door and watch you all at work," she said one day, but the children of our home are unused to such "airs" and laughed in derision, asking her to be sure and look pretty, and be a respectable statue if nothing else.

This new inmate has often caused me to think how uselessly little girls are brought up. The love of dress is a leading feature of their lives, and they care for little else; but I always have hopes for a child, however artificially reared, who loves nature and lives close to the heart of all growing things. An observing child, one who is alive to the wonderful works of the Great Creator, will learn not to despise the lowest of His creatures, and will gain wisdom from the simplest flower.

Another child who lately visited us, seeing a girl peeling potatoes, asked "if every eye made new potatoes," and when we expressed surprise that she knew anything about it as she was city-born and brought up, she said that they were taught all these things at the Kindergarten. What a good thing such schools are to busy inquiring minds, and to stimulate dull ones. Frœbel was a benefactor to children when he invented that royal road to learning, and made a pastime of the study of small but practical things, and happy is that child who learns Botany young, by studying the trees and flowers, out-of-doors, with a wise teacher, learning by pleasant paths all the wonderful and varied works of Nature, and so up to Nature's God.

SOME BITS OF KNOWLEDGE GAINED AT THE FAIR AND IN THE KITCHEN.

LAST Fall, a group of ladies were examining a collection of fruit that looked almost as fresh and fair as though just picked from vines, bushes or trees, which ever they chanced to grow upon. One lady was very sure the fruit had never been cooked, but was well preserved in cold water. Another thought it might have been cooked in the cans. Still another was positive the fruit had been canned by the new process of using acids. Presently the lady who brought the really fine collection came within the circle, and being an old friend, I asked her to impart the secret of her success, for I knew that she put up large quantities of fruit for the market every year. She said there was no secret; the fruit was thoroughly heated without allowing it to boil. The cans were then filled and left open fifteen or twenty minutes, to give the fruit time to settle. After filling up, the covers were put on and screwed down tight. Put up in this way, fruit will keep for years, and if kept in the dark will retain its original color and form. She made cup-boards of dry-goods boxes for fruit cans to keep in the cellar, and these were kept closed. In the absence of the dark closets, she wrapped each can in several thicknesses of dark cloth or paper.

OLD potatoes are greatly improved at this time of year if they are pared and thrown into cold water and left to soak several hours before cooking.

I like my dish drainer very well though it has no patent. It consists of a good-sized wooden bowl, and an old tin pan with the bottom filled with nail holes; it was originally designed for a grater, and how nice and bright the dishes look, after their warm water bath and a good rinse, set up edgewise till they dry, in the drainer. And what a saving of labor in wiping dishes and the washing and wearing of wiping cloths. Of course the spoons, knives and forks must be wiped off immediately, but the chinaware may stand till the next meal, and this will save steps. Also to leave the scouring brick and silver polish upon the back part of the work table and save unnecessary steps should be every housekeepers motto.

The strawberries I canned last Summer in cold water were a failure. MAY MAPLE.

FLUTED LACE WITH HOLES.

CAST on 18 stitches. 1st row, knit across plain. 2nd row, purl 14, leave four stitches on the left hand needle, turn the work as if to begin at the end of the needle. 3d row, knit plain all the way across. 4th row, purl 14, turn the work as in the second row. 5th row, knit plain. This ends the first flute. For the second flute: 1st row, knit plain all the way across. 2nd row, knit four, purl 14. 3d row, knit one, * thread over, knit two together, repeat from * seven times, or until you have a row of eight holes, knit one. 4th row, knit four, purl 14. 5th row, knit 14. This finishes the second row of flutes.

AUNT ADDIE.

DOMESTIC RECIPES.

AN ACCOMMODATING CAKE.

IT sometimes happens that cake is wanted when there is neither butter nor milk in the house. With sugar, eggs, and flour a very good cake can be made, even when baking powder is omitted, as the eggs will raise the cake if baked in a steady heat.

For one medium-large loaf of cake use the following quantities: Six eggs, one and one-half cup of flour, one and one-half cup of sugar, and a little salt. One teaspoonful of baking powder may be added to the flour, and one tablespoon of vinegar stirred into the whole mixture, but they are not absolutely needful. The eggs should be beaten yelks and whites together until very light; if done with a Dover egg beater they can be beaten very quickly; add the sugar and beat again with the beater, then with a spoon stir the flour in lightly and slowly without beating. The whole will then seem light as though full of yeast. Bake thoroughly in a steady heat. Instead of lining the cake pan with tissue paper, grease it thoroughly, and sift flour into it, shaking off all that does not adhere to the grease: if well covered in this way with a powdering of flour, the cake will not cause any trouble by sticking to the pan. Jelly and muffin tins treated in the same way will turn out perfect cakes.

The recipe just given makes a good layer cake with either jelly or boiled custard between the layers, and it is sometimes baked in a loaf and eaten while warm with cream or a sauce over it, and then it serves as pudding for a dinner dessert. A. B.

SWEET PICKLED PEACHES.

Pare seven pounds of peaches and lay them in a preserving kettle with three-and-a-half pounds of sugar in alternate layers, letting them stand for an hour; drain off the sirup and put over the fire with a quart of vinegar and two ounces each of whole cloves and stick cinnamon tied in a small muslin bag. Boil and skim this carefully and put in the peaches; cook until you can perforate them easily with a straw. Lift out with a skimmer and pack in jars; reduce the sirup by boiling to nearly half; pour over the peaches and seal up.

SWEET TOMATO PICKLE.

This is one of the most delightful sweet pickles, and is very nice with cold meats. Peel and slice the tomatoes, or use the small egg tomatoes; take half the weight in sugar, and for seven pounds of the fruit add one ounce of cloves and one of mace and cinnamon mixed; cook all together with one quart of vinegar for an hour, and seal. Tie the spices in a small muslin bag.

BRANDIED PEACHES.

Make a sirup with seven pounds of sugar and a cup of water; boil and skim; put in seven pounds of peeled peaches and boil for 10 minutes, or until they are tender. Remove the fruit carefully with a skimmer, and let the sirup boil until it thickens well; add one-and-one-half pint of the best white brandy, and take at once from the fire. Pour the hot sirup at once over the fruit, which should have been packed in glass jars two-thirds full, and seal.

RUBY R.

BLANC MANGE.

A blanc mange with sea moss farina for the distinctive ingredient is very nice. Take a quart of milk and add to it one level teaspoonful of the farina. Stir it all the time until it comes to a boil; when put to it three tablespoonfuls of sugar and a teaspoonful of vanilla and a salt-spoon of salt. Strain into a mould and set in a cool place.

RICE CAKES.

Boil some rice until it is soft, then, when just cool enough to handle, roll it in your hands and form it into small cakes, which dip in beaten egg and afterwards in Indian meal. Fry them in very hot fat, and, if to be eaten as a vegetable, you may place them around your meat. Or they may be served as a dessert with a rather rich sauce of butter, sugar, flour and a wine glass of Madeira wine and a little nutmeg. AUNT ADDIE.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

"From His Own Experience in Preparing Ground for Winter Grain, by the use of the 'ACME' Pulverizing Harrow, the writer is quite free to say that had this implement been used instead of the common harrow, the loss of wheat by the hard winter would have been trivial, and that many a single acre which has not returned the seed sown upon it, might easily have made enough grain to have paid the whole cost of the implement." See advertisement on page 492.

Doctors Prescribe

Ayer's Cherry Pectoral, for three reasons:—it is perfectly safe for old or young,—can be relied upon in cases of emergency,—and possesses great curative powers.

I consider Ayer's Cherry Pectoral a medical success and a chemical triumph. I have found this medicine a powerful specific for Colds, Coughs, and Pulmonary Complaints. I use it in my own family and recommend it in my practice.—Parker Cleveland, M. D., Prof. of Chemistry and Materia Medica, Bowdoin College, Brunswick, Me.

Ayer's Cherry Pectoral is an invaluable remedy for Colds, Coughs, and all Pulmonary diseases. I use it myself and prescribe it in my practice.—A. S. Pettenger, M. D., Glen Gardner, N. J.

Ayer's Cherry Pectoral,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

FARMERS,

Send for Circulars and Price List of The BARNES PAT. IRON FENCE, the cheapest and most durable fence in the world. Address THE BARNES PAT. IRON FENCE CO., EASTON, PA.

HARNESS. Hand-made. Best Oak Leather, $8.50, $10, $13.50, $15. Double Sets, $20, $25, $30. Shipped subject to approval. 64-page Catalogue free. Order one. KING & CO., Wholesale Manufacturers, OWEGO, N. Y.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

News of the Week.

HOME NEWS.

SATURDAY, July 17, 1886.

KANSAS Prohibitionists nominated a full State ticket at Emporia, Wednesday.....Same day the Dakota Constitutional Convention at Sioux Falls decided, 31 to 30, not to submit to a popular vote the proposition whether South Dakota shall not declare itself a State. Will, probably, wait now for admission to Statehood by Congress. ..Since Prohibition, bibulous Rhode Islanders get drunk in Massachusetts, just over the line—State so small that the "line" is not far from any part of it.... ..N. H., Prohibitionists go in for a straight State ticket.....A decision of the Superior Court at Atlanta Ga., Wednesday, says it is against the law to sell liquor by the quart, and furnish glasses so that it may be divided up and drank at the bar. Liquor stores closed in consequence. ..The system of leasing out convicts to contractors to labor on public works, in vogue in many of the Southern States, is generally considered barbarous by the best part of the population. Often atrocious cruelties are practiced on the wretched felons by overseers worse than the worst slave-drivers, and at best their hardships are almost intolerable—hence frequent mutinies, murders of guards and vain attempts to escape.....150 convict coal miners at Cole City, Ga., have been on a "strike" but after two days in a stockade without food or water, they surrended Wednesday..... ....The first tin ore ever mined in the Western Hemisphere arrived in Chicago Wednesday from the Black Hills on its way to Eastern factories. The tin deposits in the Black Hills are thought to underlie 7,000 square miles, and when the business is fully developed, we'll have enough tin for our own use and lots to export. Our imports now amount to $30,000,000 a year.....Over 3,000 strikers at the carrying shops and 54 tanneries at Peabody and Salem, Mass. Higher wages and shorter hours demanded—both sides firm.....A poverty-stricken cooper named Carlisle D. Graham, built a stout barrel and entering it, after the head had been fastened on, allowed it to shoot down the Niagara River below the Falls, and through the whirlpool, Sunday last. The foolhardy fellow is now making money by exhibiting himself and his barrel..... .....Five surrendered Apache Indians say Geronimo is severely wounded, and is now in the Sierra Madres, while his son has charge of the hostiles. These are divided into small bands, most of which are inside a triangle, with Mexican troops on both sides, and Americans at the base. Nearly all the cavalry of our army are worn out in hunting the tireless savages. A speedy surrender or annihilation is once more promised. More outraged, mutilated and slaughtered victims found..... ..... .Canadian Indians in the Northwest reported starving, as "large quantities" of the Government provisions sent them, stick to the hands of dishonest agents .....The Mass. Legislature has appropriated $20,000 for the entertainment of the President, should he visit the State this Summer..... .. Dr. Nott's experiments *à la* Pasteur, have been abandoned after four inoculations of the Newell boy. There ought to have been 10, but the boy became sick and nervous after each operation; and his father refused to have them continued. Dr. Nott says he can't afford to treat dog-bitten persons without public support. The boy is reported to be showing symptoms of rabies..Rear Admiral John A. Worden, the hero of the Monitor, died at Newport, R. I., Sunday night.....It is estimated that the use of natural gas in Pittsburg and vicinity now annually displaces 47,000,000 bushels of coal.....The losses by fire in the United States and Canada between January 1 and June 30, are placed at $53,900,000, or $3,000,000 in excess of the loss during the same period of last year..... ....Forest fires have caused great destruction of timber and crops near Marquette, Mich.... Numerous other fires are reported in various parts of the country, and others still more numerous and disastrous are feared owing to the dry state of all vegetation, due to the long continuance of torrid weather.....Sing Sing prison, N. Y., cleared $6,000 in June. With Ferdinand Ward and other financial geniuses within its walls, oughtn't it have cleared $6,000,000?.....The President has just announced that Government employés must not use their offices to meddle in politics..... ....The Committee of Ways and Means (Morrison Chairman) has reported adversely against the Randal tariff bill..... John T. Patrick, Commissioner of Immigration for North Carolina, is at No. 1 Broadway, this city, trying to induce immigration from the North and Northeast. He says: "North Carolina has 52,000 square miles of land and 1,500,000 people. A million are white and the balance blacks. The State can accommodate 10,000,000 people".. ..A revolution has broken out in the State of Tamaulipas, Mexico, and it is feared it will extend along the Rio Grande. Government troops flocking to suppress it; no conflict yet. It is thought the General Government has a hand in it, as it wants to put the State under military rule..... .....After three weeks of constant effort a jury of 12 men has been at last obtained to try the Chicago Anarchists. An attempt has been made to get a man on the jury who would be sure to vote for the acquittal of the miscreants, so as to "hang" the jury instead of the conspirators, $2,000 having been offered as a bribe, but the jury fixers are reported to have failed..... Reports that Powderly will run for the Governorship of Pennsylvania.....The Eastern Green Glass Bottle Association in convention at Atlantic City, N. J., have voted to join the Knights of Labor..... ....Suits are being instituted by the Federal Government against a large number of wealthy Saginaw Valley lumbermen for trespass on the Isabella Indian Reservation in Michigan, whence they are charged with taking timber. ....Frightened by the monstrous growth of the River and Harbor Bill, due to logrolling, the Senate Committee on Commerce offers an amendment scaling down every item, good and bad, 25 per cent.....It is reported that a new extradition treaty has been negotiated between this country and the British Empire, by which dynamiters will be surrendered. It is also expected that the dishonest rascals of this country will no longer find a safe refuge in Canada; nor those of Canada find one on this side of the line. Other provisions still unknown..... Severe wind storms raged, Wednesday, in Penn., Ohio, Ind. and Mich., being specially furious in Eastern Ohio and Western Penn., where many houses were wrecked and great damage done to crops. In one county of Ind. no less than 100 buildings were thrown down; while in some sections corn, oats and fruit are said to be a total loss. ..The Chicago switchmen are still "out" and resolved to stay "out" as long as they are paid while idle, by the labor organizations of the country. The Lake Shore Road still maintains guards, and the strikers threaten to renew their harrassing tactics as soon as these are removed.....Investigation now being conducted shows the St. Louis House of Delegates (Board of Aldermen) are just as corrupt "boodlers" as those of Chicago or New York. Bribery on all sides.....The death of Representative William H. Cole, of the Third Maryland district, removes the sixth member of the House who has been carried off by sickness during this session of Congress.....Mayor Harrison of Chicago, has vetoed the Aldermen's tunnel-gift ordinance, and no attempt has been made to pass it over the veto as the necessary two-third vote could not be obtained in face of the hurricane of public indignation. ....A remarkable raft of logs, bound together in the form of a cigar shaped cylinder, will be started by sea from St. Johns, N. B., in a few days for New York, towed by a steamer. The cylinder is 400 feet long and contains 1,500,000 feet of logs valued at $35,000. The object of this scheme is to save $8,000 duty, as sawed timber is taxed, and logs enter free..... .....During the past six months 5,192 miles of railway, under 17 corporations, have been sold under foreclosure to satisfy $190,000,000 of indebtedness, leaving out in the cold $128,000,000 in stock..... .....Drugs are selling at prices in some cases one-third less than those obtainable three years ago. Opium has fallen from $3.75 to $1.95 a pound; quinine from $1.70 to 50 or 60 cents an ounce, on account of the growth of richer barks in Ceylon and Java; cod liver oil from $97 to $27, and some other standard drugs equally..... ....The Gould Southwestern strike is reported to have cost the K. of L. $100,000 for contributions and expenses, while the men lost over $1,000,000 of wages; and the cost to the Missouri Pacific Road alone, against which the strike was chiefly directed, amounted to $3,500,000. The losses to merchants, farmers, manufacturers and the trade and industry of the country must have been enormous, the loss to Chicago alone being put at $1,500,000. What was gained for so enormous an outlay?. .....The act of Congress, approved June 29, 1886, reducing the fee from eight to five cents on domestic money orders not exceeding $5, goes into effect on July 29.....The Republican convention of Kansas has re-nominated Gov. Martin, and emphatically, but a trifle indefinitely, declared that "the saloon must go."..... .....A new colony of Oklahoma boomers was to start on July 15, numbering, perhaps, 2,500, with subscriptions said to amount to $62,000. Major Sumner, in command of the "boys in blue" there, has ordered the Indians on the west of Oklahoma to plow five yards around their ranges, as he intends to burn every spear of grass except that needed by the Indians and their stock, so that the invaders, having no feed for their stock, will be starved out.....Paul H. Hayne, the Southern poet, was buried Sunday, at Augusta, Georgia..... ....The Government has paid the fines of the fishing vessels seized by the Canadians and has made a demand on the English Government for re-embursement.....Yesterday Representative James Laird, of Nebraska, struck Representative Thomas R. Cobb, of Indiana, a violent blow in the face for "giving him the lie," in one of the lobbies of the House. More blood flowed from Cobb's nose that has been shed in Congress since Brooks assaulted Sumner nearly 30 years ago—a big scandal.....

FOREIGN NEWS.

SATURDAY, July 17, 1886.

THERE are this morning only three elections still to be held in Ireland and eight in Great Britain, and all will be closed to-day except those for the Orkney and Shetland Islands, which are fixed for July 26. The present position of the parties is as follows: Conservatives, 315; Unionists, 72; Gladstonians, 191; Parnellites, 83. The Conservatives and Unionists have polled 1,485,179 votes and the Gladstonians and Parnellites 1,416,612. Gladstone will probably resign either before Parliament meets on August 5, or immediately afterward. Neither he nor the Parnellites are a bit discouraged. In view of the shortness of the time for organization before election, of the dense ignorance and prejudices of many of the voters, of the split in the Liberal party, of all the hostile social influences of the aristocracy and plutocracy of the United Kingdom, and of the gross misrepresentations and falsehoods of his opponents, the G. O. M. has polled a splendid popular vote. Seven months ago Home Rule was advocated by only a handful of Irish members of Parliament; now it is the declared policy of the Liberal party of the United Kingdom, championed by the most influential statesman of Parliamentary history. The Conservatives are 21 votes short of an absolute majority, and in no case can they gain more than a few more votes. If they undertake the Government they must secure the support of the Unionists, and such a composite Cabinet cannot last. Home Rule is deferred, not defeated. Another disolution of Parliament and another election are probable ere long. Meanwhile the Liberals will educate the people up to Home Rule; many new voters—thorough Gladstonians—will be registered, and the results at next election are likely to favor the Old Parliamentary Hand. What the Conservatives and Unionists most desire is to stave off legislation on the matter until Gladstone dies or is unable to work. If he lives a few years more, not only is Home Rule assured, but the downfall of the House of Lords as is at present constituted, is pretty certain..... ..More riots in Belfast begun by an attack of Orangemen on Catholics. Police interfered. Catholics retired, and Orangemen attacked the police for preventing them from attacking the Catholics. Several deaths and a number of severely wounded in the hospitals—riots becoming chronic in the place. A Nationalist meeting at Stewartstown, Thursday, was attacked by Orangemen, and many were seriously injured. A number of other riots also reported. It is thought that there is a deliberate plan to force the Irish Catholics into violence, so as to give an excuse for coercion under a Conservative Government. The Nationalist leaders earnestly urge peace on their followers as by far the best policy..... The French Chambers closed last Thursday. The Duc d'Aumale and the Duc de Chartres, Princes of the Orleans family, having been expelled from the French army and from France, vigorously protested against their expulsion from the army, as an officer's commission is his property. Gen. Boulanger, the fiery Minister of War, said in the Assembly that he wouldn't tolerate an insolent letter like d'Aumale's. Legitimist Deputy Lareinty said to thus insult the absent was an act of cowardice, and all the monarchical members indorsed him. A duel between him and Boulanger takes place this morning. The latter is becoming extremely popular, on account of the energy with which he has placed the army on a war footing and his out-and-out republicanism. Many see in him the "coming man" in France..... ....Cholera is spreading in Italy. Yesterday the official returns were: Briudisi, 75 new cases, 44 deaths; Fontana, 37 new cases, 19 deaths; Latiano, 16 new cases, 7 deaths; Codigoro, 7 new cases, 2 deaths; Venice, 1 new case, 1 death. There were also eight new cases and three deaths at Trieste, which belongs to Austria, and six cases and two deaths at Fiume. The fatality among those attacked is greater than ever before; and the cramps in the bowels are excessively severe, death often occurring within an hour after the attack.... ..Fresh gold discoveries in the northern part of Western Australia. Glowing accounts in Sidney—likely to be the largest gold fields ever found in Australia. The Government geologist estimates the area of auriferous deposits at 3,500 to 4,000 square miles. A rush of diggers to Sidney on the way to the new fields... .....There was a tremendous series of earthquakes in the northern part of New Zealand the other day—the worst known in the present generation. Blazing volcanoes suddenly started along a mountain range 60 miles long. For hundreds of miles the country is covered with mud and ashes belched out to a prodiginous hight. Vessels 250 miles out at sea were enveloped in darkness produced by clouds of ashes which covered deck and rigging. At one time it seemed probably the whole island would sink, so great was the commotion of heaving earth, blazing mountains and scoria-charged air. Deaths numerous; damages heavy, though the section that suffered most was only thinly populated. Full particulars not at hand yet.....

AGRICULTURAL NEWS.

SATURDAY, July 17, 1886.

OSWEGO COUNTY, N. Y., has shipped 45 car-loads of strawberries this season to New York City, amounting to over 500,000 quarts—freight from $175 to $200 per car-load..... .....A colony of farmers, discouraged by the numerous droughts and the failures of many crops in succession, and the great ravages of chinch bugs, are about to start from Centralia, Ill., to settle in Oregon.....Reports still come of horrible sufferings from drought in Western Texas, where "rain hasn't fallen in some places for 14 months!" The surviving cattle are parched and starving. In some places "settlers are selling their farms for mere trifles and leaving for the east in abject poverty". The losses in cattle are put at over $6,000,000. Texas Congressmen are asking the Government for help for the suffering settlers.....In one day lately there were landed in London 10,000 baskets of cherries, weighing 700 tons, from Rotterdam. These cherries, grown in Holland, were valued at two gilders (about 80 cents) per basket..... A frost Thursday, at Warren, Mass., killed beans and potato vines.....In the lately civilized islands of Fiji is the largest sugar-mill in the world, crushing between its rollers 15 tons per hour, or nearly 7,000 tons in a week. The crop, cut annually, yields at the rate of two tons of cane per acre, and a fleet of three steamers, six steam launches, 50 iron punts of 60 tons each, and 10 lighters of 180 tons each, are engaged in transporting cane from the plantations to this mill. Nearly all the work is done by dark laborers.....Chicago's new dog-license law says: "License, one dollar; no license, no tag; no tag, no dog. $35,000 are expected under the law, against $11,500 under the old.....Over 700,000 pounds of English washed combing wool have been bought at the London sales for America. .....Only 13 bales of foreign wool were received in Boston last week, against 2,074 bales for the same week in 1885.....The English Privy Council Inspectors have been unable to discover any trace of contageous diseases in 68,000 cattle and 39,000 sheep imported from Canada.. ..Exports from New York last Friday and Saturday included 950 live cattle and 3,160 quarters of beef..... The exports of live stock and dressed meats from Boston for the English markets last week were 966 cattle and 3,320 quarters of beef. American cattle and dressed beef are unusually low-priced in England just now. Best American live cattle are dull in English markets at 12c. to 12½c. estimated dressed weight.....A cattle car has been patented which has an arrangement of food bins, feeding sack and water trough of novel construction, so contrived that the car may be used to carry cattle in one direction and freight or merchandise on the return trip, the feeding boxes being adapted to fold back out of the way.....

Hay Fever.

THIS malady is an index of a condition of the system which should be thoroughly changed. That this is possible is shown by many letters from patients. The following is an example:

From Rev. T. J. Taylor, Warrenton, N. C., Oct. 21, 1885.—"Some time in August I ordered a Treatment of Oxygen for my aunt. She had suffered with *hay fever* regularly every year for fifteen years. When I ordered the Compound Oxygen her annual attack of hay fever had already commenced, and as you did not promise relief after the commencement of the attack, we were not very hopeful. But to our astonishment and joy the Oxygen relieved her at once, and only on one evening after she commenced the Treatment, and then only for a few hours, did she have any considerable trouble with her hay fever. Though she really had hay fever, it was so slight after she commenced using the Oxygen, that she was scarcely conscious of it. I do not know what Compound Oxygen will do for hay fever in general, but *this case of fifteen years standing was mastered by it.* You are at liberty to use this in any way you may see proper, for the good of hay fever victims. I believe it will cure hay fever. It did it in this case at any rate."

DRS. STARKEY & PALEN, 1529 Arch St., Phila. Pa., publish a monograph on Hay Fever which is sent free to all interested. Numerous cures are reported.—*Adv.*

Crops & Markets.

SATURDAY, July 17, 1886.

The official report on the prospects of the crops in Hungary estimates the yield of wheat at 89 per cent. of the average. In 1885 the yield was 91 per cent. The prospects are excellent for rye and oats and bad for barley.

The official report says that while the prospects of the Prussian crops, especially those of rye and wheat, are generally highly satisfactory, the outlook in several districts of Silesia is bad. Oats, barley and potatoes generally promise normal crops.

The French Government has deferred till September, its proposition to put additional duties on imported bread-stuffs. It could hardly raise the price of wheat 12 cents a bushel at the beginning of the cereal year in which it will need probably 90,000,000 bushels of foreign wheat or its equivalent in flour.

The July report of the Department of Agriculture, made public on Saturday, confirms our Crop Special's estimate of the winter wheat crop—about 295,000,000 bushels. Our Special went to press on July 3, and as, therein stated, our estimates were based on reports received here between June 25 and July 1, and some of them were over a week in the mails. Those from the spring wheat region therefore referred to the condition of the crops about June 20, and most of the irreparable injury to them from drought has occurred since. We made allowance for the damage done before that time; but a good rain would not only have prevented further injury, but have undone some of the mischief already accomplished. We put the damage to Spring wheat on July 1, at about 5,000,000 bushels; Statisticiau Dodge of the Department of Agriculture, on July 12, put it at 6,000,000 bushels up to that date; but we are strongly of the opinion that it was greater.

The loss is variously estimated by different "crop authorities" all the way from 6,000,000 to 60,000,000 bushels. There is a tremendous amount of rough guessing, and a good deal of premeditated lying for speculative purposes. By exaggerating the damages, the "bulls" expect to raise prices temporarily; by belittling them, the "bears" are trying to keep or pull prices down. Many farmers' papers think it to the interest of farmers to underestimate the crops, under the idea that prices will then go up; but no paper has a monopoly of the "news," and the truth is bound to be approximated by some. They induce some of their readers, however, to hold on to their produce in hopes of better figures, ultimately losing thereby. Those who sold their wheat last harvest at current figures, did better than those who held on. "Tell the truth always as it seems to you" is the best motto in this as in other matters.

The July report on corn of the Department of Agriculture, is the first for the year. It says the acreage of corn has very slightly declined in the Middle States and in Maryland, Virginia and South Carolina, with some increase in other States of the South, which is largest west of the Mississippi. In the Ohio Valley the acreage is nearly the same as in 1885. West of the Mississippi the increase is heavy; in Kansas 20 per cent., Nebraska 10, Dakota 30. Total increase 3½ per cent., or about 2,500,000 acres. Corn is late on the Atlantic coast, from wet weather, cool nights and slow germination. In many situations the seed rotted, and replanting became necessary. Instances are reported of planting three times. Yet there is generally a fair stand, and the crop is growing and healthy, and with seasonable July weather will make a full yield. It has suffered quite as much on the Gulf coast, where the areas are still more unpromising. The great corn belt of the West reports medium to high condition, growing better from Ohio to Kansas. The Missouri Valley averages better than the Ohio River and lake region. There is a full stand in Missouri of vigorous and even growth, and 10 days earlier than last year. The Kansas returns are equally favorable. Insect injuries have nowhere been serious. The chinch bug is now threatening some localities in the West. The general average is 92, against 94 last year and 96 in 1884. The State average of the following States are: New York, 92; Pennsylvania, 88; Virginia, 93; Georgia, 92; Texas, 82; Kentucky, 91; Ohio, 93; Indiana, 95; Michigan, 96; Illinois, 97; Missouri, 101; Nebraska, 95, and Iowa, 99.

Oats have been more severely injured than even wheat; and grass has been burnt up, and the hay crop greatly curtailed. A heavy rain storm towards the end of last week throughout nearly the whole of the Northwest, put an end to the dry spell. Just now most of New England is suffering severely from dry weather, and crops will be greatly injured unless rain falls soon; considerable irreparable damage has been done already.

In spite of heavy rains last Saturday, which washed off much of the honey-dew in many parts of the New York hop-growing region, the crop is still reported in a very ruinous condition from hop-grubs, lice and honey-dew. Prices for old hops vary considerably in the different local markets, but are everywhere higher. Here sales have run up to 28 cents for best State and 25 cents for California. Several State lots have been returned from London. At San Francisco the new crop is reported sold at from 27 to 30 cents per pound.

In view of the current prices of farm stock, hogs are now probably the best paying animals on the farm, and the general impression is that the present high figures will continue throughout the season. With the prices of hogs high in face of a full supply, the prices of mutton sheep should soon advance, as there is some scarcity. The returns of summer pork packing show an increase of 285,000 hogs over the same time last year.

The wheat market is quieter, with prices fluctuating within a moderate range. Latest estimates of damage to spring wheat 10 to 20 per cent., earlier reports having been exaggerated. A strong under-currant of feeling that a higher range of prices for wheat is likely to prevail during the coming crop year than has been quoted for two years. This is emphasized by unfavorable crop reports from the United Kingdom, Russia, India, Australia and elsewhere. No. 2 red wheat at New York closed yesterday at 87c., against 86¾c. a week ago. The tobacco crop of Missouri needs rain. London wool prices are no higher. Domestic quotations are unchanged and holders very firm.

MARKETS BY TELEGRAPH.

SATURDAY, July 17, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1⅝c. lower; No. 2 Spring, ½c. lower. Corn, ⅛c. lower. Oats, 1c. lower. Rye, 3½c. lower. Barley, 6½c. lower. Pork, 7½c. lower. Cattle, shipping steers, about the same; stockers and feeders, 25c. to 35c. lower; best of other grades higher, poorest, lower. Hogs, from 5c. to 10c. higher.

WHEAT, active; Sales range: July, 76¼@78¾c; August 78¼@79¼c; Sept., 80@80¾c; No. 2 Spring, 77½c. CORN.—Active; cash, 37¼c; July, 37¼@37¾c; August, 38¼@38¾c; September, 39¼@39¾c. OATS.—Quiet; Sales ranged: Cash, 28½c; July, 29¼c; August, 29¼@29¾c; September, 29½@29¾c. RYE.—Quiet; No. 2 at 54½c. BARLEY.—September, at 65@66¼c. FLAXSEED.—No. 1, at $1 11, MESS PORK.—Steady; sales ranged; Cash, at $9 86½@9 90; August, at $9 82½@9 90; September, at $9 92½@10 00½. LARD.—Steady; sales ranged; Cash, at $6 55@6 60c; August at $6 62½@6 67½; September, at $6 70@6 75. Short Ribs.—Cash, at $6 35. Boxed Meats.—Dry Salted Shoulders, at $5 80@6 00; Short Clear sides, at $6 70@6 75. CATTLE.—Shipping steers, at $3 75@5 40; stockers and feeders, $2 25@3 75; cows, bulls and mixed at $1 50@3 75; bulk, $2 90@3 60; through Texas cattle, $3 35@4 30. HOGS.—Rough and mixed, $4 50@4 90; packing and shipping at $4 80@5 05; light weights at $4 50@5 00; skips, $2 70@4 40. SHEEP.—Market steady; Natives, $2 20@4 40; Western, $3 10@3 50; Texans, at $1 75@3 10; Lambs, per head, $1 25@2 25.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is ⅝c. lower. Corn, 3¼c. higher. Oats, 4c. higher. Rye and Butter, steady. Eggs, 1c. lower. Flaxseed, unchanged. Pork, 25c. higher. Cattle, slight variations up and down as to grades. Sheep, 10c. to 25c. lower.

WHEAT.—Active; No. 2 Red, Cash, 75½@77c; August, at 78¾c; September, at 80¾c. CORN.—Active; No. 2 mixed Cash, at 34½@35c; August, at 27¼c. OATS.—Dull; No. 2 mixed, Cash, at 30@25c.; August, 27½c; September, at 28¼c. RYE, 51c. BARLEY.—No. 3 Spring, 48c. BUTTER.—Creamery, 15@17c; dairy, 10@15c. EGGS, at 7c. FLAXSEED at $1 02. HAY.—Timothy, $10 50; Prairie, $7 50. BRAN, 46c, at mill. CORN MEAL, $2 90. PORK, $10 50. BULKMEATS.—Long clear, at $6 30; short ribs, $6 45; short clear, $6 50. LARD.—$6 30. CATTLE.—Market active; Good to Choice Native Shipping Steers, $4 60@4 90; Common to Fair, $4 00@4 50; Butchers' Steers, $3 50@4 35; Cows and Heifers, $2 00@3 25; Stockers, and Feeders, $3 25@4 25; grass Texans, $2 00@3 30. HOGS.—Market active; Lights, $4 65@4 85; Packing, $4 60@4 85; heavy, $4 90@5 00. SHEEP.—Shipments, none; Market quiet at $2 00@3 75.

BOSTON.—GRAIN.—Corn in demand. Steamer yellow, 50@50¾c, and steamer mixed 49c. per bushel. OATS.—In better demand, and prices higher; No. 2 white, 42c; No. 3 white, 40¾@41c; barley, 45c; fancy white, 46c. per bushel. Rye is held at 58c. per bushel. Bran, $14@14 50 for Spring, and $15 50@16 00 for Winter; Fine Feed and Middlings at $14@18, and Cotton Seed Meal $23 on the spot, and $21 75 per ton to arrive. HAY AND STRAW.—Market for hay has been firmer at $17@18 per ton for choice and fancy, $15 00@16 00 for fair to good, $13 00@16 00 for fine, and $9 00@13 00 for poor and damaged, Western choice, $16@17, do fair to good $14@15. Straw.—Rye straw is held $19 00@19 50 for choice, and $14@18 for common to good. Swale hay at $10 00@11 00. Oat straw, at $10@11 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra, 18½@19c; do. extra firsts, 17@18c; do. firsts, 15@16c; Western creamery, 16@18c, for extra firsts to extra; firsts, 14@15c. Northern dairy, 15@17c, for Vermont extra firsts to extra; firsts, 13@14c; seconds, 12@12c; Western dairy, 12@13c for firsts; seconds, 9@11c; imitation creamery, 11@15c for extra firsts to extra; ladle-packed, 9@12c, for extra firsts to extra; firsts, 8@9c; seconds 7@8c; grease, 3@4c. NEW CHEESE.—New York and Vermont extra, 7¼c; do. do. firsts, 6½@7¼c; do do. seconds, 4@5c; Western extra, 7¼@7½c; do. firsts, 6@6½c. EGGS.—Cape and near by, per doz. 17c.; Eastern extras 15½@16c; do. firsts, 14½@15c; Northern firsts, 14¼@15c; Western firsts, 14c; Provincial, 14@c. BEANS.—Choice Northern hand picked pea, $1 75@1 80 per bushel; do. do. New York, small $1 60@1 70; do. do. screened $1 15@1 20; medium choice, hand-picked, $1 45@1 50; do. do. screened, $1 15@1 25; Yellow Eyes, improved $1 40; do. choice flats, $1 25@1 40; Red Kidneys, $1 60@1 70; Canada pea, 65@95c. per bushel for common to choice; green peas, Northern, 90c@$1; do. I WILL INSURE YOUR HOGS!

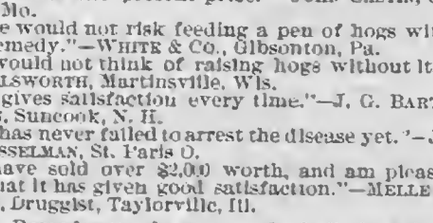
DR. JOS. HAAS'

HOG AND POULTRY REMEDY



[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will

1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH

In my Remedy, I make the following offer:

I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.

"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.

"Have used the remedy with success."—D. G. BARBER, Easton, Md.

This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.

"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIS, Grant City, Mo.

"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.

"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.

"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.

"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St. Paris O.

"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.

The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.

Prices, $2.50, $1.25, and 50 cents per package. 25 pound cans, $12.50.

JOS. HAAS, V.S.,

Member of Indiana State Veterinary Med. Association,

INDIANAPOLIS, INDIANA.

"**Summer fallows** receive one or two plowings only during the summer. The surface hardens into a crust and becomes a mass of clods when plowed; and weeds are allowed to grow and seed the land. The time required for repeated plowings prevent the necessary work. But with the 'ACME' Pulverizing Harrow, Clod Crusher & Leveler, work even better than plowing may be performed in one-fifth of the time, the weeds sliced up and killed, and the operation repeated so often that the field will be a clean mellow bed by Autumn." See advertisement on page 492.

Beautiful Maryland Homestead Farm.—280 Acres, $8,000. For full particulars, address H. P. Chambers, FEDERALSBURG, MD.

For the Young.

ABOUT the meanest thing that boys and girls can do is to make fun of their sisters when they have company. I don't want to see any of such work done. When I see boys and girls going about the house slamming doors, shouting and saying things that will make sister feel uncomfortable, I seem to lose my eyesight and see nothing but a lot of young bears who are doing their best to worry and plague those who love them. I like a brute bear far better than I like a human bear. The brute knows no better than to be selfish and cruel. It pays to be ladylike and gentlemanly. We can't possibly begin too early in life to make ladies and gentlemen out of ourselves.

ONE bad thing about cats is that they want to catch birds. A cat is far more cruel than a dog. There are two little birds that come about our house just after every meal. They seem to know the time of day. They will pick up crumbs and hop about almost within reach of one's hand. They are so tame that I fear the cats will pounce upon them some day. I should be sorry to have that happen, for I like to have the birds about. I don't think it would do any good to whip the cats even if they did get hold of the bird. It seems to be a cat's nature to be sly and cruel. One of our cats met with an accident last year. The dog snapped at him and broke his jaw. Now one tooth stands right out. He is a good mouser, though, but he hates all dogs, I can tell you.

D. WOODWARD & SON, of Clinton, Mich., write me that they would like very much to send a plow to every one of the Cousins who tried for the prize. It would cost a small fortune to do it, though, there were so many. They will send a plow at cost, though, to any who tried and failed. This is the best they can do, and those who want to know more about their offer should write them.

THE hens are very fond of purslane, or "pussley," as most people call it. Pull up a little and throw it into the hen-yard, and see if I am not right. I lived in a family once where the people saw in a paper that "pussley" would make very good greens. We had a very large mess cooked, but it was never eaten up, and we never had any more cooked.

I AM inclined to think that most mistakes are made because people try to do things in a hurry. People want to rush and get things done so that they can take up something new. That is frequently why they fail. It is what we do well that counts for us. I notice that people who are so anxious to do everything in a day are always discontented and unhappy. Take time and think out your work before you do it. One thing well done will count for more than a dozen things half done.

HEALTH is the most valuable thing one can ever have. I know it, because I have been both sick and well. Youth is the time to lay the foundation for a sound constitution. Take plenty of sleep. Most boys are glad to do that, anyway, I guess. Never use tobacco or liquor. I hate to see a boy put his brains into a paper and burn them up, yet that is just what these boys do who smoke cigarettes. At school the boys used to smoke hay-seed or grape vines. They thought it was great fun, but I notice that every one of them to-day carries the markings of tobacco on the face. It is cut there just as plainly as though some one had taken a knife and cut deep lines all over the face. Let tobacco alone boys, and drink red-hot iron sooner than take a glass of whiskey.

A GREAT many people think they must have something stronger than water to drink in the harvest field. I have never found anything better than good butter-milk. When I was a boy they used to make "switchell." This was a mixture of water, molasses and ginger, and it was pretty week stuff too. I think water would be stronger than that. It would certainly quench the thirst more completely. Lemonade is good when we can get fresh lemons, but it generally costs considerable to make it. Don't drink too much of anything. When you drink water it pays to stop and "taste" it. In that way it will go down the throat slowly and do you more good.

IT is hard to keep the flies out of the house now, isn't it? Good screens at the doors and windows are a great comfort. Some flies seem to wait, and when the door is opened, even a little crack, in they rush. They are bound to come where they can do the most harm. It is hard work sometimes to drive them out, yet out they have to go, or there will be very little comfort. I never thought much of "fly poisons" or traps. It always seemed to me easiest to guard the doors and windows with screens, and then drive out all the smart little fellows that got in. Driving out the flies is something like washing dishes in the fact that we seldom get any credit for the work, even though it is very important. I am sorry to say that some men appear to take "woman's work" just as if it was a matter of course. They never notice that nine times out of ten dinner is on time, but how they grumble when it comes a few minutes late. Such men ought to "change works" a few times. Then they would have more patience. My boys are going to make men of another stamp, I know.

I HOPE there is a croquet set at your home. There ought to be, I am sure. Croquet is a good game, and it does one good to play it. I like all these things that make life a little easier and brighter. I don't like to see people going about with great long faces, and taking many bottles of medicine when all they need is a little brightness and fun. Trouble and care are afraid of a good croquet ground, and they won't follow people onto it. I don't believe much in complaining or in "bad luck" you see. We can make life just about what we want to, if we will only make up our minds to do it.

I LIKE to see people figure on what I call a cash basis. You ask some people how much they are earning, or how much money they have, and they will tell you some great amount of money that fairly discourages one. On asking questions about it, we will be pretty sure to find that they included in this sum what they expect to get, and what they hope to own. That is a very poor way to do business. If you have five cents in cash, and property that you might sell for $5, if you could find a purchaser, it is a great deal wiser to say, "I have five cents," than it is to say, "I have $5.05." It is the same way with what you earn. If you get $3 a week, say so, and do not try to make it seem more by figuring like this: next year I may have $5, the next year $7, the next year $10 and the next $15, and so I am really getting $8 now. That is the way some people figure, and a poorer business policy, it would be hard to find. I knew a boy once who said he made $100 a month as a book agent. I found that he was out just half a day and sold one book, but he figured that had he kept on he might have made the $100. Men or boys who work on such a principle will never prosper. Remember it boys. Never go beyond your means, and be sure to understand just how much you are worth.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

"CAN you tell me how far it is to the Bear Creek school house?" I asked as I neared him.

"I reckon I kin—its nigh about four mild."

His little eyes seemed to run all over me as I stood before him. He examined me from head to foot. When his inspection seemed complete, his under jaw thrust itself out with a movement that I could hardly understand. He appeared to have formed some decided opinion with regard to my personal appearance.

"Yer the new master, ain't ye?"

He did not raise himself from his position near the post. The little eyes seemed to sharpen as he looked at me, and one boot advanced a little. He did not wait for me to answer, but went on with a voice that sounded like a saw.

"You jest bring yer baggage—whatever 'tis—an' pack it in that waggin. I'm goin' right out, 'cause our folks wanter finish butcherin' to-day."

He seemed to push the post away from his shoulder, which process brought him to his feet. The great boots savagely placed themselves in the best position for supporting their burden. He seemed like a man of very few words, and there was no reason why I should continue the conversation alone.

I walked back to the station and secured my satchel. As I came tugging back with it, I saw him sitting in his wagon waiting for me to come. He might easily have driven down to meet me, but that was evidently no part of his plan.

"Ain't got many cloes have ye?" he said, as I placed my burden in the wagon. "Jes' well, I guess; there ain't no call for dressin' up when ye go boardin' round. Ain't no reason why the master should dress up no mor'n the common run o' folks. I can make me a good livin' wearin' a pair of blue jeans pants, an' I don't see why you can't. I made up my mind a good spell ago that I wouldn't never take no prize to no beauty show, an' I expect that has saved me a heap. They is plenty more folks that orter come to the same mind."

I had no desire to combat this theory. What he said appeared to be true enough. It is never safe to engage an unknown opponent in debate when the issue can be avoided. It is not always the most fluent speaker that wins in a debate. I took my place on the seat beside my new friend. I hardly knew where we were going, but there was something in his manner that shut out all inquiry. He sat heavily on the seat with his head thrust forward, in advance and not above his round shoulders. Now and then he turned his head and allowed his little eyes to stray over me.

"Git up!" at last he shouted with a flourish of his whip. The fat red horses started at a lazy walk, which pace seemed to fully satisfy the driver. We passed out over the low hill, over a country road running among five farm houses and smooth fields. I began to feel that I ought to talk. It was quite uncomfortable to be thus silently riding with a total stranger. After thinking over what I had better say, I fell back upon the weather as most likely to create a discussion.

"This is a nice day Mr. ——" I paused to let him fill out the sentence.

"That shows ye aint no jedge of the weather, or else ye live in a swamp somewhere—it don't make no odds which as I knows of."

Having thus proved my inferiority, he went on.

"My name's Hardhack. I'm the moderator up to Bear Crick Deestrick. John Mouser's treasurer an they is a feller named Forest down by the school-house up fer director." I caught at this last name at once. It was that of the author of the letter that tempted me into Bear Creek.

"I had a letter from him. Nice man I suppose, and a good officer?"

"Don't know nothin. One of these yer city fellers come out here an thinks he's goin ter run us by haw an gee. We put him in fer director 'cause he's the last man ter move in. He can talk the juice outer a tree, but I low he'll quit a heap of it long afore school lets out. These fellers that wants things all sliced and dried, aint got no call fer Bear Crick, I kin tell ye.

Somehow I began to consider this as a gentle hit at me. I made haste to change the conversation a little.

"What sort of a school have you here—pretty well advanced?"

"School's all right ef the teachers hadn't been clubbin' it back fer the last five years. The last three Winters we've hed men teachers, and every one on 'em gut put out—last one gut whipped inter bed so'st he stayed there fer a spell others they hed hoss sense enough fer ter run. We tried a number o' years ago hevin' a woman teacher, but that didn't do no good. She undertook fer ter whip one of the big boys onct, an' he up an' kissed her; that bruck up school fer thet Winter. Forest up here, he wanted fer ter hire a woman teacher agin this Winter, but I see right through thet bizness—he lives nigh the schoolhouse, sos't the teacher'd wanter board to his house an' he'd git pay frum the deestrict.

"A heap of folks in the deestrict wanted a big fat feller as lives four miles south of town. He ain't no teacher at all, but he kin sing a good song an' speak a dozen pieces fust-rate. But John Mouser wouldn't hev him 'cause he licked his brother's little boy onct, and Forest he see how things was goin' so'st he voted agin him too. I wanted fer ter put in my sister's boy. Good, clever boy; ain't no scholard as I knows of, but it'll take an ox fer ter down him in a wrastle. He cud hev stopped to my house so'st his board wouldn't a cost the deestrict a cent.

"When it come ter pickin' out a master, we all sorter voted agin each other till we sorter settled on you. Didn't nobody want ye as I knows of, but we hed fer ter hev somebody, an' here ye be. If them other fellers hadn't stuck out so, we'd a ben well fixed."

(To be continued.)

NOTES FROM THE COUSINS.

DEAR UNCLE MARK: I am a little girl nine years old, and would like to join the Y. H. C. I like to read the nice letters from the Cousins, and if you will be so kind as to print this, I will write again sometime. My Mamma has 400 little chicks, Wyandottes, Hamburgs and Plymouth Rocks; I get up early every morning and help feed and water them. She has 10 little turkies, too. They are the Mammoth Bronze. We sent to Kentucky for a trio this Spring. We had some little pigs running out, and they ate up one nest of 18 eggs just when they were ready to hatch, and they got to eating Mumma's little chicks, too, so Papa had to shut them up. I have two sisters and three brothers, so I do not get lonesome. We love each other so much that we never quarrel with each other. Your little niece, BERTIE DILLE.

Edgerton, Kan.

[These pigs deserved a shutting up, I am sure. I am glad they got it. Write again.—U. M.]

DEAR UNCLE MARK: I wrote you a letter last Fall, and it was not printed, so I thought I would write again. I live on a farm of 240 acres. I am 11 years old. I have one little sister. She is two years old. Her hair is just as curly as it can be. We have three work horses, and are breaking two colts. We have three colts a year old this Spring, and one that is two years old. We raise a good many Shorthorn cattle. We have 10 little calves, and about 25 little pigs. I have two cows and a little pig. I received the Rural Garden Treasures, and we planted them, and there were a great many came up. School was out about three weeks ago. We raise the Plymouth Rock and Houdan chickens. We think the Houdans the best layers we have ever had. We had about 70 little chickens, and something caught them all but 50. We caught a skunk and two rats. I have a nice lot of pansies, and I had good luck with all of them excepting the ones I tried to raise in a box, and they nearly all died. I have some California popcorn planted, and some onions. The sets will soon be ready to pick. We set out a young orchard of cherry and apple trees, and they all lived but one. Your niece,

Sidney, Iowa. NINA A. DODGE.

DEAR UNCLE MARK: I wrote one letter to you and seeing only part of it in print, I thought I would write again. We had only three days of snow here, and only about two weeks of frosty weather. I think that is pretty good weather, don't you? I live on the bank of Nehalem River, it is very pretty in the Summer. We have a good many flowers here that grow wild. It would take too long to tell all their names, so I will not trouble you with them. I am getting my flower garden ready to plant my flower seeds. I will write and tell you how nice they are when they bloom. Papa catches lots of Salmon here in the Summer, also trout, flounders, lamprey, eels, crabs, clams, mussels, etc. Nehalem is a good climate for fruit, such as plums, apples, cherries, etc. The wild fruit are huckleberries, blackberries, gooseberries, etc. We have 21 head of cattle, two horses, four pigs, two cats, and 16 chickens. Your niece,

Nehalem, Oregon. DAISY DEAN.

DEAR UNCLE MARK: I do not see many letters from this State, so I would like to join the Y. H. C. I am nine years old and live on a farm of 200 acres. We have 16 cows this Summer, and seven horses. We raised over 1,000 quarts of strawberries last Summer, two kinds, Glendale and Wilson, I think the Wilson is the best, but the Glendale grew the larger. Ma canned 50 quarts, and preserved as many more; they are very nice. My little brother and I go to school Summers (the snow is so deep we can't go much in the Winter,) so we do not work as much in the garden as some of the Cousins, but we raised some turkeys and have not sold them yet for they only pay five cents per pound here yet; Isn't that cheap? There is a nice spring of water on our farm that never freezes; it used to be covered with a kind of rock (petrified moss) about the size of a cauldron kettle, with the bottom up, the water came out of a hole in the side I like flowers very much. My Mamma has a great many. Your nephew,

Albert Lea, Minn. RAY E. DILLS.

DEAR UNCLE MARK: We are two little girls—Katie, aged seven, and Florrie, aged 6 years—that wish to join the Y. H. C., as we are very much interested in the letters from the Cousins' and your answers and good advice. We attend school and can read the Cousins letters when the words are not too long. We have a pet canary named Pete; he is a grand singer. We are raising an Alderney calf which we call Pansy; its mother's name is Butternp. We raised some very fine peppers last Summer, and took some to Aunt Sis for pickles, as she hasn't any garden. She gave me (Katie) a very pretty Testament. As soon as we can write so that you can read it, we expect to write to you. Papa has written this for us.

KATIE B. & FLORRIE V. CLINE.

Catonsville, Md.

[Let us have a letter in your own handwriting.—U. M.]

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

PERSONALS.

THE young Emperor of China is very ill with consumption.

THE King of Siam's new baby is named George Washington.

EX-PRESIDENT ARTHUR is growing stronger, more cheerful and better tempered.

SENATOR STANFORD, of California, it is said, will resign after Congress has adjourned. Tired of public life; lately had an attack of an apoplectic nature.

REJECTED Solicitor-General John Goode is to become a candidate for Congress for the District of Norfolk, Va., if Cleveland does not renominate him.

HARRIET BEECHER STOWE will write no more. Health impaired by constant attendance on her husband, who has been ill 18 months, and is expected to die at any time.

ATTORNEY-GENERAL GARLAND is tired out, and is going to take a two months' rest in Arkansas. The general impression is that it would be much better if his retirement were permanent.

ALICE FREEMAN is 28, pretty and President of Wellesley College. She knows more of the 'ologies and 'isms than most male professors of twice her age, and can tell what she knows in seven languages.

"NEVER has anybody heard Roscoe Conkling to better advantage in any court," is the general opinion with regard to the ex-Senator's late speeches against the outrages of the Western Union telegraph monopoly.

GEORGE B. LORING, the late handsome Commissioner of Agriculture, with some other capitalists, has bought several hundred acres of land about seven miles from Washington, and will establish there a new town, to be called Loring.

OUR correspondent, William Hale, of South Glastonbury, Conn., has this season sold 900 bushels of strawberries from a little over six acres, at an average price of 11½ cents for the season—largest packing and marketing in one day, 49 bushels.

PROF. L. B. ARNOLD has been lecturing, with much commendation, in England. He finds the butter in the Island of Jersey better than English butter, but so low-flavored as to be a disappointment. Genuine butterine—hog's fat and annatto—competes with it there under its genuine name.

REPORTS multiply that Nellie Grant Sartoris finds her English husband a loafer and a bully, who spends on himself the slender allowance allowed him by his father, and leaves his wife to shift for herself. Before the crash of Grant & Ward, Gen. Grant always sent his favorite child liberal remittances.

Col. Fred. Grant is working like a beaver to pay his debts and re-establish himself. He is employed by a house-finishing and wood-working concern, and also makes money by his articles on the war. "I shall not be satisfied," he says, "till every dollar lost through my advice shall be restored to the rightful owner."

GEORGE, of Greece, is ready to go out of "the king business" at the first good offer. He has saved up a tidy little sum which will net him $125,000 a year, is building a palace at his old home, Copenhagen, and is only waiting a good excuse to abdicate and leave the foreigners over whom he has ruled to their own destruction.

GOV. SWINEFORD, of Alaska, on a visit to his old home at Marquette, Mich., married, last Sunday, Mrs. Minnie Smith, a wealthy widow. He is 50 and has been a widower for several years. He will take her to Sitka in November, together with a colony of Michiganders to develop the mining resources of the region.

MORTIMER and Roland Bunting, of Madison, Florida, 13 and 11 years old, have this year rented 12 acres of land and planted it with corn and cotton, have worked the crops carefully, and have good prospects of an abundant yield, besides raising enough vegatables to supply the large family of their father, who is an invalid.

OTTO, the new crazy King of Bavaria, is confined in the castle of Furstenried, an hour's drive from Munich. He has lucid intervals in which he reads the newspapers. His chief amusements are smoking cigarettes and eating strawberries. He takes long walks in the park round the castle. A mad doctor and three guards follow him at a distance.

JOSEPH CHAMBERLAIN, one of the Members of Parliament for Birmingham, and the Radical kicker in the Gladstone Cabinet, though 46 looks hardly over 35. In speaking he is cold and unimpassioned, even when most "wrought up." He always dresses in the hight of the fashion, and a dudish eye-glass is his constant companion. He has become wealthy through a monopoly patent on a screw-making device. Strongly democratic, from principle or policy, he has for some years been a "power" in the land.

It is money in the Pockets of FARMERS.

TO MAKE FERTILIZERS AT HOME with
POWELL'S PREPARED CHEMICALS
FOR $12.00 You can obtain A TON of SUPERIOR PHOSPHATE

Humorous.

THIS is the dude's own season. Everything is fresh and green.

POET—"And you will print my poem?" Editor—"Yes, sir; in the puzzle department."—*Tid-Bits.*

AT this season, when an arm of the sea encircles a neck of land, you may look out for (fishing) smacks.

THE funniest thing isn't a frog. The man who said it was, had never seen a fat woman try to run.—*The Ætna.*

WHEN an idler enters the sanctum of a busy editor, and the editor says, "Glad to see you're back," what does he mean?

THE man with a No. 15 neck and a No. 14 collar, has a hard struggle to make both ends meet.—*Detroit Free Press.*

"SALLY, what time do your folks dine?" "Soon as you go away—that's Missus's orders."—*Comic Weekly.*

YOUNG WIFE—"Won't you try some of my home-made bread, dear?" He—"I have tried and I'll try again, but it's a very trying situation to be placed in."

No, Ethel; when you hear of a young girl having made a good "match," it doesn't signify that she has got something that will get up every morning and light the fire.

HIT IT SQUARE.—"Wall, that's a new idee. I never heard o' puttin' spittoons on the side o' the houses before," remarked an old countryman, as he walked up to our telephone transmitter and made a bullseye the first shot.—*Palmer Journal.*

"Is Mike Howe on board of this train?" asked a man, approaching an engineer who was oiling up his locomotive. "I don't know anything about your cow," replied the engineer, sharply; "I am the engineer, and not the cow-catcher of this train."—*Exchange.*

A FRENCHMAN thinks the English language is very tough. "Dare is 'look out,'" he says, "which is to put out your head and see; and 'look out,' which is to haul in your head and not for to see—just contraire."—*Comic Weekly.*

"PAPA, are you in favor of the eight-hour system?" "Yes, daughter, under certain circumstances. Why do you ask?" "Because, papa, George has only been staying four hours every evening, and he told me last night that if you favored the new system he needn't go home so early."—*Farm Journal.*

EIGHTEEN CARATS.—Jeweler (to new boy)—"Did you sell anything while I was out, Johnny?" New boy—"Yes, sir. I sold six plain gold rings." Jeweler (very much pleased)—"Good, my boy. We'll make a first-class jeweler of you one of these days. You got the regular price, of course." New boy—"Oh, yes, sir. The price was marked on the inside, 18c., an' the gentleman took all there was left, sir."—*N. Y. Sun.*

LAST week Gilhooly went to Onion creek, near Austin, to shoot quail. He got dinner at the ranch of Macbeth Simmons, a granger living in that vicinity. While at dinner Gilhooley remarked: "Isn't this rather early to be killing pigs?" "Of course it's too early to be killing hogs. Who is killing hogs such warm weather as this?" "Why, I've heard pigs squealing ever since we sat down to dinner." "Pigs squealing! Why, that's my oldest daughter practicing her singing lesson."—*Texas Siftings.*

"MR. FEATHERLY," said Bobby at the dinner table, "what's an average?" "An average?" "Yes. Pa says you come to see sister twice a week on an average." Featherly was very much amused. After explaining to Bobby the meaning of the word, he said: "I suppose you thought it was some kind of a carriage, Bobby?" "I thought perhaps it might be a bicycle, but I knew it couldn't be a carriage, because ma says you're too mean to hire— ——" "Bobby," interrupted his mother, "will you have another piece of pie?"—*New York Sun.*

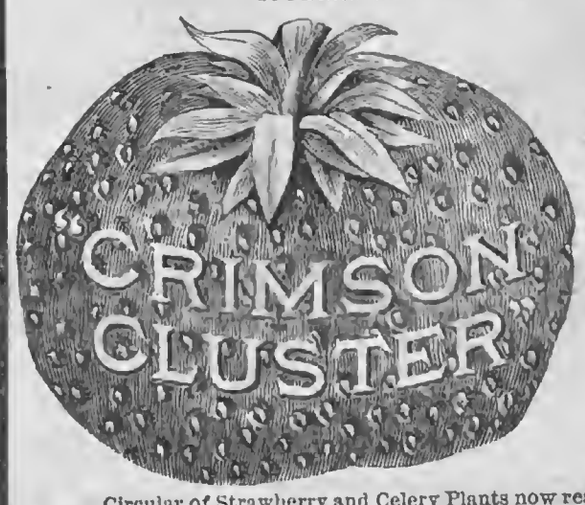
NEW SEEDLING STRAWBERRY, **"Crimson Cluster."**
OFFERED THIS SEASON FOR THE FIRST TIME.



On the 10th of June of this year, we examined this Strawberry on the grounds of Mr. E. W. Durand, and found 3,000 plants that had been planted on the 15th of August, 1885, which in less than 10 months from the date of planting, were producing a crop that would average fully a quart to each plant; 3,000 quarts from the 3,000 plants, or at the rate of over 20,000 quarts per acre. The crop was so immense and the size of the berries so large, that the pickers, who were paid 2 cts. per qt., averaged 25 qts. per hour, or $5.00 per day—a fact beyond question, and which a dozen affidavits could be had to attest. When to this extraordinary production we add the further facts that this strawberry is of the richest crimson color, borne in immense clusters, and that it is one of the LATEST as well as the EARLIEST, as its great vigor prolongs its season of fruiting, added to its excellent quality, there is every reason to think that it is bound to be the most valuable strawberry ever raised by Mr. Durand.
Prices, in pot-grown plants, (ready July 15th), 12 for $2.50; 50 for $7.00; 100 for $12.00. By mail at dozen rates.
Circular of Strawberry and Celery Plants now ready and mailed free on application.
PETER HENDERSON & CO. 35 & 37 Cortlandt St., NEW YORK.

NURSERY STOCK---FALL 1886.
The old and Reliable! **SYRACUSE NURSERIES** Come to the front For the Fall of 1886
with the choicest Stock of their specialties, STANDARD APPLES, STD. and DWARF PEARS, PLUMS and CHERRIES, ever offered to the public, all young, thrifty and well rooted.
Also a very superior assortment of GENERAL NURSERY STOCK both FRUIT AND ORNAMENTAL, including all the popular ORNAMENTAL TREES, SHRUBS, and ROSES.
All Nurserymen and Dealers are cordially invited to inspect this superior stock or correspond with us, before placing their orders for the coming Fall.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1905. NEW YORK, JULY 31, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

A QUESTION SUBMITTED TO OUR READERS.

IN February of last year half of a three-acre lot belonging to an esteemed neighbor was given 11 loads of city stable manure. It was spread evenly over the surface where it remained thus exposed until the following April. The same quantity of manure was placed in a heap on the other half where it remained also until April, having been turned often enough in the interval to prevent burning. It was then spread and the entire field (three acres) was plowed. The plowman noticed that the soil underneath the half upon which the manure was spread in February was mellow, yielding readily to the plow—while the other half upon which the manure had not been spread until April, was so much harder that it was easy to tell whenever the plow passed from one to the other. The manure pile had so shrunk during the Winter and covered the acre and a half so sparingly that Mr. Bogert, the owner, concluded to give it an additional spread of three bags of high-grade complete chemical fertilizer, that is, at the rate of 400 pounds to the acre. The entire field was then harrowed and planted to potatoes. The vines of the acre and a half which had received the stable manure alone, spread in February, were thriftier during the season than those on the other part, and the yield of potatoes was one-quarter more. The entire field was then fitted for rye and seeded to Timothy last Fall, and to clover last Spring. The rye on the half where the stable manure had been spread in February and which had received no chemical fertilizer, was appreciably heavier than that on the other half, and when the rye was cut as now, the clover was so much thicker as to mark the boundary distinctly. Previous to 1885, the field had been treated in every way the same for many years, and so far as had been noticed the yield on the two halves was the same.

Mr. Bogert called the writer to look at this field and to explain why the two halves should yield so differently under the treatment described. Why was the manure which was spread in February more effective than the combined chemical fertilizers and the same quality and weight of manure which had been kept in a heap and spread in April? We have no satisfactory explanation to offer, and the question is submitted to our readers. It should be considered that the soil under the manure spread in February was mellow and friable as compared with the other part. But is that a sufficient explanation?

THE CRESTED MOSS ROSE.

THE specimen of this shown at Fig 303, was received from Ellwanger & Barry, and is said to have been discovered on a wall of a Convent near Fribourg, and sent out by Vibert in 1827. This is very different from other moss roses in which the flowering stem as well as the calyx is covered with "moss." In the Crested Rose three of the five sepals of the calyx are crested as shown in our engraving from nature. The other two are not crested at all. One of the crested sepals is shown beneath the opening bud, much enlarged. These feathery sepals are very pretty and odd. Sometimes this peculiar growth appears on the petioles of the leaves below the flowering stem. The flowers are rose-colored and fragrant though, in themselves, of no unusual beauty. The plant is hardy and vigorous.

MADAME DE WATTEVILLE is a new Tea Rose, from Storrs, Harrison & Co., of Painesville, Ohio. It is of exquisite beauty. The coloring is hard to describe. The petals are yellowish-white, inclining to pink about the edges as they unfold, and of a deeper purplish pink about the petals of the yet unfolded bud, giving the flower a rich, distinctive beauty. The plant is vigorous and blooms freely. It is a pity such delicate coloring is not to be found among the hybrid perpetuals or Remontants.

CHESTER CO. MAMMOTH CORN.

IT is within the easy memory of our older readers that about six years ago the largest crop of corn on record, produced under similar conditions, was raised at the Rural Farm. There were five acres of Chester Co. Mammoth, which yielded by measurement 112 bushels of shelled corn per acre—the best acre yielding over 130 bushels of shelled corn. Another acre of Tennessee Prolific, or, as it is now called, Blount's Prolific, yielded 130 bushels of shelled corn. The ground was measured and the crop estimated and certified to by R. J. Dodge, L. E. Benedict, E. Williams, C. V. Mapes, Dr. Habirshaw and others.

We have now a field of 4.66 acres of the Chester Co. Mammoth which promises to equal, if not to excel, that yield. It had been in Timothy and clover for four years without any manure or surface dressing of any kind. It was plowed early in December last, and this Spring 20 tons of farm-yard manure (mostly cow) were spread and harrowed in with a spring-tooth sulky harrow, and once with an inclined-tooth harrow. Then six bags of complete fertilizer ($45 per ton) were sown, and the field was again harrowed with an inclined-tooth harrow and the corn planted with a corn-planter, dropping a kernel about every foot—the drills four feet apart. The stand is perfect, and the plants are the thriftiest we have ever seen so early in the season.

Chester Co. Mammoth Corn is peculiar in several ways. It is late to start, but makes a rapid and stupendous growth afterwards. The stalks, which are very large, will average 10 feet high in a good season, bearing generally one—sometimes two—immense ears. The kernels are yellow, dented and large—the cobs as large as those of any kind we know. It seems peculiarly adapted to this part of the country, as well as to Pennsylvania, where it originated. The better ears vary from 14 to 32 rows, about a foot in length and 1,000 kernels to an ear are not uncommon. We hope we shall be able to report to our readers as large a yield as is now fairly promised. We can not recommend this corn for other parts of the country, but the splendid yield it gives us shows that farmers everywhere should not take for granted that they already have the best corn; but experiment in a small way year after year with every good variety they can hear of until a kind is found that suits their soil and climate as well as the Chester Co. suits this farm. Had we been content with the corn generally raised hereabouts, this would never have transpired.

ORANGE GOOSEBERRY. (From Nature.) Fig. 304.

GOSSEBERRIES.

TRIUMPH was received from George Achelis, of Westchester, Chester Co., Pa. It is a large berry certainly; but it so mildews this season that a longer trial is necessary to make a report in other particulars.

CAYUGA and INDUSTRY, the former from H. S. Anderson, Union Springs, N. Y., the latter from Ellwanger & Barry, Rochester, N. Y., have not as yet fruited.

ORANGE is from H. M. Engle, of Marietta, Pa. "It is," he writes, "probably a seedling of the Houghton." This berry is with us of real value. It is one of the earliest to ripen, if not the earliest. It is of medium size, sweet and tender. The color is a dull yellow. Plant thrifty. See Fig. 304.

IMPORTED VARIETY from H. Sumner, Polo, Ill. He imported it 10 years ago from England. The berries average of fair size. Some mildew and some do not. A longer trial is needed.

DOUGAL No. 10, mildews badly.

DOUGAL No. 3, berries from medium to large—scarcely any mildew. Green when ripe. Ripens with Porter. Quality medium.

DOUGAL'S No. 2. Fruit of medium size and high quality, hairy. Color light green shaded with purple. See Fig. 305 (p. 494).

Horticultural.

SMALL FRUIT NOTES FROM PRES. WILDER.

THE season has been quite favorable for the strawberry. The Horticultural Exhibition was the best for 50 years. Among strawberries the Belmont carried off the Silver Cup, although it had powerful competitors in the Sharpless and Jewell. The Prince (of Berries) took the first prize for a new variety, and the Parry the second, but there was a silver medal also given to the Gold, which is larger, higher-flavored and handsome. It was raised by P. M. Augur & Sons. Among the new varieties was the Dorchester, which, although exhibited in a general collection, attracted special notice for its size and beauty, and as a very late, handsome kind the Omega received a first-class certificate of merit. Jewell fully justifies the high commendation it has received, and Sharpless is more popular than any other kind. Ellwanger & Barry conferred a great blessing on the world when they introduced it.

In regard to raspberries, the Carman is the earliest cap variety I possess. It is sweet and *very good*, a valuable acquisition. The Ohio comes in next, and is hardy and productive. The Marlboro is early and prolific, ripening its crop gradually, and when fully ripe, of good quality, good size, and firm enough for traveling to distant market; but to obtain these advantages the suckers must be constantly kept down. It is the most vigorous and robust of all raspberries. My favorite is the Souchetti, which I introduced 30 years ago. This and the Franconia lead in the prize taking. Cuthbert is good but no improvement over the Franconia. The Crystal of Caywood, a new white, is vigorous and prolific, handsome and firm, promises well for market.

MARSHALL P. WILDER.

THE GOLDEN AND BLACK DEFIANCE STRAWBERRIES.

I HAVE raised the former in connection with many other kinds for four years, and every year I find more and more reasons to like it. It is a fine, healthy plant, bearing bright scarlet fruit, which turns somewhat darker when very ripe, and though slightly acid, is of a rich, sparkling flavor and very refreshing to the taste. The plant bears abundantly, and is one of the very latest I have tried. Longfellow, though holding out as well, gets ill-shapen and stunted at the last, while it has a habit of laying its fruit on the ground so that one side of its magnificent berries is often imperfectly ripened. Ken-

tucky, too, always fails to ripen well at the close of the season, but Golden Defiance, especially on young plants, fills out its berries perfectly and ripens them equal to the very last with me.

I have also the neglected but most delicious Black Defiance, which, though not a very heavy bearer and inclined to furnish imperfect fruit towards the close of its season, I have not yet seen surpassed in flavor by any of the high-blooded new sorts, and I have tried nearly all of the prominent ones. Of course, strawberries for the private garden are one thing and for the market garden quite another; and the James Vick and Manchester, though healthy and prolific, do not give us the *kind* of return which we demand in the "home acre." E. S. F.

Dorchester, Mass.

VEGETABLE GARDEN NOTES, JULY 12.

POTATO BUGS were never more numerous than they are this year, but a little Paris-green in water kills them quickly.

SNAP BEANS.—From sowing time till eating time is about eight weeks.

POLE BEANS in low, moist ground run high and pod well. Peas in the same places will mildew badly.

CAULIFLOWER.—My best heads now are from April out-door sowings.

GROW SPINACH, RADISHES AND LETTUCES in the coolest and moistest spot in the garden.

SEED ONIONS look fine. Maggots went to work in May, but didn't stay long.

TURNIPS.—I got very clean turnips from late July and August sowings, and from ground in which they all get wormy before July.

EGG PLANT.—I have been using Early Long Purple for some time. The other popular sorts sown at the same time and grown under the same conditions, are not yet big enough to use.

PEAS.—I am now sowing this year's seed. The peas I didn't pick from my early sowings, I left for a week or two to ripen; these are now harvested, cleaned, and I am sowing them in succession for late crops.

EARLY PEAS.—From First of All (from Henderson) and Improved Daniel O'Rourke (from Young & Elliott) we gathered our earliest peas on June 3. If there is any difference between these two sorts, I cannot find it out.

ALASKA PEAS.—What on earth is there in this pea to make a fuss about? With me it is not any earlier or better than Daniel O'Rourke. And who would eat round peas like them after the wrinkled peas, like Alpha, are fit to use? My earliest Alphas came in about five days after my earliest peas of any sort.

THE DEACON LETTUCE.—I had the Deacon from Farquhar Brothers, Boston, and White Summer Cabbage from Peter Henderson, New York. Both kinds were sown on the same day and under the same circumstances, and both are now hearting alongside of each other, and not a particle of difference in appearance or flavor can I detect between them. In fact, both are the White Summer Cabbage as I have known and grown it for years. It is one of the very best summer lettuces grown, still that is no reason why we should make it a "Deacon."

THE OAK-LEAVED LETTUCE is good enough in its way, and to grow as an extra variety; but for general use it will never become popular.

THE SALAMANDER LETTUCE is my favorite for summer use; it never fails me. It is good to eat and good to look at, but it will "bolt" in hot summer weather, like any other lettuce.

HENDERSON'S NEW YORK LETTUCE is veritably a giant and the finest exhibition lettuce I have ever seen. But isn't this the same that I have known and grown under the name of Breen's Prize-taker since '84? Anyhow, I am now growing both side by side and cannot see a whit of difference between them. This Breen's is annually exhibited at the Queen's Co. (N. Y.) Summer Fair and I believe is always the prize-taker. When I first grew it I almost thought it would turn out biennial it was so slow to "bolt" in early Summer; but July came, and off it "bolted" quickly enough. Its size is enormous and it forms a very solid, white heart, but for my own eating I prefer Salamander.

ASPARAGUS.—Our main crop of asparagus is Argenteuil, but I don't think it is any better than Moore's or Conover's. My neighbor, Mr. M. Ham, who runs a large asparagus farm, has a decided preference for Conover's.

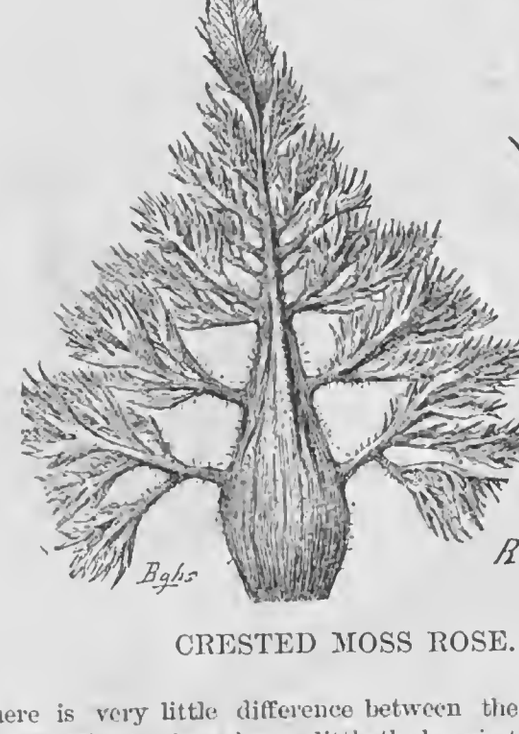
DWARF SHADBUSH.—An editorial note on page 468 of the RURAL reminds me that we have two clumps of little plants, 12 to 40 inches high. One lot is in an open, sunny place; the other in better but shadier ground. In both cases the little bushes bore an extremely heavy crop of fruit, ripe between the 20th of June and 1st of July. The fruit was in small clusters, large, nice-appearing, and not bad to eat, but at least two-thirds of it had been penetrated by insects. But apart from their use as fruit-bearing plants, these little bushes are worth growing for their wealth of white blossoms in earliest Spring. Amelanchier Canadensis v. oblongifolia also fruited freely with us. Its fruit ripened during the first days of July, was more palatable than that of the Dwarf Shadbush, and free from injury by insects.

CELERY.—I am planting celery to succeed potato, top, and other "set" onions, strawberries, peas, and potatoes. While I plant early celery in rows that are four to five feet apart, three feet is far enough apart for winter celery. I throw out trenches five or six inches deep, put a heavy dressing of finely-rotted manure into these, fork it into the soil, and plant in the afternoons, and always water well at planting time.

LEEKS.—I had resolved to have a trial of leeks this year, and from seed-houses far and near bought seeds last Spring. Result: a first-rate crop of large American Flag from Peter Henderson; a good crop of Rouen from Thorburn, and absolutely nothing from the other sources. "Reliable" and "tested" printed on seed bags don't amount to much.

SPINACH.—Growing alongside of each other in excellent soil, I have Savoy-leaved, Round-leaved, Viroflay and Long Standing. Savoy-leaved yields a lighter crop and runs to seed several days ahead of the others. There is very little difference between the others: Viroflay is perhaps a little the heaviest

JAPAN PERSIMMON.—We have two plants, one a nice-looking specimen six feet high, and well branched, the other rather a scraggy sample. The first we cover over with barrels in Winter; the last is in a sheltered place, and must not at all regard it as hardy around New York. WILLIAM FALCONER.



DOUGAL NO. 2 GOOSEBERRY. Fig. 305

unprotected in Winter. Both bloomed and set fruit, but I am disappointed to find that almost all of the fruit has dropped off. Mr. Thomas Hogg when here a few weeks ago told me that it ripened fruit out-of-doors in New York with him a few years ago. But we

THE MARLBORO IN N. J.

Mr. J. T. Lovett, the nurseryman of Little Silver, N. J., writes us as follows: "The Marlboro Raspberry is almost a failure here this year, and I hear the same reports from all over Jersey. It has at last gotten through the petting stage, and then put to stand on its merits; it *does'nt* stand at all but goes back on its best friends. Too much foreign blood 'that's what's the matter.'"

STRAWBERRIES IN CANADA.

THE following were sent to me for testing:

THE JEWELL STRAWBERRY I put first for size of berry, vigor of plant and productiveness.

CRAWFORD'S No. 6 is the largest, heaviest and best berry on my grounds.

AMATEUR is rather more productive than either of the foregoing, but not so large, though better-flavored.

HATHAWAY'S No's 3, 5 AND 9 do very well; but are not so large as any of the former; but they are prolific and keep fruiting longer than the others. J. L.

Granton, Ont., Can.

ONION RAISING IN MONTANA.

LAST AUGUST I sowed some red onion seed,

CRESTED MOSS ROSE. Fig. 303. (See first page.)

intending to have it right for sets in Fall; but it did not look worth gathering in October, so I let it go. In the Spring it looked nice and green, so I broke off the seed sprouts and when the growth was thick I thinned out and transplanted, and by the middle of July the onions averaged over two-and-one-half inches in diameter, and will be very large by September 1. So I have accidentally stumbled on to a way to raise nice, large onions here, and they are a valuable crop, never selling for less than five cents per pound, and generally for more.

Gallatin Co., Mont. B. P. VAN HORN.

Pomological.

HOW TO RENOVATE AN OLD ORCHARD.

IN the RURAL of December 5, an inquiry is made how to renovate an orchard. Allow me to state the following facts:

Many years ago, a Mr. Gerrish owned a large farm in Boscawen, N. H., on which he set out what at that time was the largest orchard in Merrimack County. Afterwards he divided his farm between his two sons, the dividing line running through this orchard, cutting it into nearly equal parts. Both parts were treated alike—with neglect. Subsequently the county bought the southern farm, on which is now located the Alms-house. Two years ago, when the present superintendent took charge, this orchard was a forlorn-looking place, grown up to bushes, the trees being covered with moss and dead bark, and for years the crop had hardly paid for harvesting. The superintendent took hold of this matter with energy, cut the bushes, trimmed the trees, scraped the bodies and large limbs with an old hoe, plowed the ground and applied unleached ashes at the rate of 75 bushels per acre, and seeded to grass. The result was astonishing. The difference in the color of the foliage of that part so treated and the remainder, could be distinguished at a long distance, and while several hundred barrels of first-class fruit were gathered from the part so treated, on the other part there were but few apples, and those of cider quality. The superintendent says that if there is never another spear of grass cut, or another apple gathered from this orchard, the county has lost nothing, for one year's crop has more than paid the whole outlay. The soil is a gravelly loam, underlaid by hard-pan—moraine clay. SILER.

Farm Topics.

CORRESPONDENTS' VIEWS.

MRS. FISHER speaks of some wonderful samples of Timothy seen at a fair at Portland, Oregon. I send you a few heads to show what our Northern Vermont soil and climate are in the habit of producing. [The specimens sent were over five feet high, with heads nine inches long.—EDS.] Mrs. Fisher's account of the fair gave me an idea that Oregon would be a fine State to immigrate to, but there is another side to it. A gentleman, a good farmer and botanist, who has been carefully through the West, smiled a very knowing smile when I told him about those wonderful heads of Timothy. "That is the way most tourists are apt to observe and write," he said. "They see the exceptional rather than the average. A fair is just the place to present an average that is equal to the best, and even the most candid and observant travellers are apt to be misled with reference to the natural products, manufactures, etc., of a country." He showed that the average production of many of the highly-praised sections of the West was really no higher than that of our Eastern and Middle States, and often not so good. He declared that the meadow, pasture, tillable and fruit-bearing lands of Oregon are confined to narrow valleys—a very small proportion of the entire area. Their productions will not average a whit better than those of Vermont. These valleys are sparsely settled, and their roads are killing to travel on. They are clear mud in wet weather, deep under snow in Winter and rough and dusty in Summer. Such things make us better satisfied to stay in Vermont. RICHARD NOTT.

Charlotte, Vt.

THE Crystal Creamer, which I secured for my list of subscribers, came in good order and I have given it a fair trial. It gives the best satisfaction of anything I have yet seen. Every farmer who keeps three cows should have one. It will pay to sell a cow and buy a creamer, if it cannot be bought in any other way. I never got better pay for so little work. Every housewife should insist upon having such a creamer. She needs it just as much as a man needs a mower or reaper. She can use it the whole year and make it pay well, turning out the best of butter and keeping sweet milk always on hand. One piece of ice, 8x12 inches, placed in this creamer will keep the milk cool all day, and all the cream rises in less than 12 hours. We gave it the hardest test it could have, for the weather has been very hot—95° in the shade. We have grade Holstein cows. They are half thoroughbreds, none of them over four years old. They give good satisfaction. I began grading up my stock a few years ago, and few things have paid me better.

Saginaw Co., Mich. HENRY BEYTHAN.

THE only "patent" I can get for bringing out a superior new plant or fruit is the credit that should go to any one who brings out something useful and permanent. The inventor of a useful implement is lauded by press and public, and the Government protects his rights by giving him entire control of his invention. That is all right and proper. It is a tribute to patience and brains. Yet the introducer of a new fruit has no such reward for his patient labor. The first dozen plants he sells give the purchaser a chance to disseminate the new variety. J. M. OGLE.

Pierce Co., Wash. Ter.

PEOPLE speak of the great advantages of irrigation. It is a good thing, but it is expensive here. It requires capital here, and money is scarce. We have to pay 25 cents for a miner's foot of water for 24 hours. Orchards and vineyards are slowly coming into culture. Grapes do fairly well without much water.

Lincoln, Cal. M. D,

SAY what you will, the LeConte Pear appears to be the "coming pear" for these parts. More and more are each year coming into bearing. There is a large breadth of land planted to peanuts. It becomes known to farmers that the most profitable way for them to make pork is to cultivate the nut freely and then let the hogs root themselves into fatness. J. M. C.
Palmer, Fla.

MY potatoes this year are splendid—as fine as any we ever had. When the ground was prepared, I made deep trenches with a plow, put in the potatoes and drove the Acme harrow lengthwise of the row once. Then I put in the fertilizer and mulch and harrowed the ground until level. The plants come up well. This is cheaper and better than covering the seed with a hoe. G. E. LOPER.
Suffolk Co., N. Y.

I FAIL to see how a farmer can make use of his carpenter's skill to better advantage than in putting up a grape trellis around the back door. A few vines trained over it will provide fruit, shade and comfort, as few other things can. S. J.
Essex Co., Mass.

THERE are plenty of men yet who will not take a farm paper. One man I know takes nothing but a county paper. He wants to know what the "folks" are doing. Another takes only a Sunday-school paper. It contains a list of white lies called stories. They both say my corn is better than theirs, because I have "good luck." The man who makes a business of taking a paper will get something out of it. The man who takes one just because it is cheap, is a penny man, anyway.
Wabash Co., Ind. R. L. M.

I WANT to utilize my hop kiln for drying fruit. The late description of a plan for drying raspberries in a greenhouse makes me think the thing can be done. I am raising hops and expect to continue in the business. I also raise small fruits, and want to extend the business. The home market cannot be depended upon, so I mean to dry the surplus. We can get tons of wild blackberries for the picking. I think it will pay well to dry them if I can make use of my hop kiln for the purpose. Others near me feel the same way. We want experience, hints and plans from others.
Cleveland, N. Y. E. P. T.

I HAVE killed lice and other insects on the hop vines with a solution of whale-oil soap. I take a piece of soap about the size of a hen's egg, and dissolve it in 10 quarts of water. I sprinkle or spray the vines with this, with good success. S. E. A.
Smyrna, Del.

THIS country will hardly do to "boom," but with industry and economy one can get a good living, if not riches. The Summers are a little hotter than in New York State, and the Winters a trifle milder. We were glad to look at Mrs. Fisher. She is younger than we thought, though she does not give her age. We would like to see "Anaxamander and the laddie," and thus get a glimpse of the whole family.
Macon Co., Mo. MRS. J. V. R.

WILLOWS to be used for baskets should be cut every year in the Fall. If allowed to grow two years or more, they can be used only for bottom sticks, and are not worth so much. If prepared for market, they should be peeled in the sap, which is a good deal of trouble. So many willows were raised last season, that basket-makers are all busy. I do not see how it could be made to pay to establish a business elsewhere, the price is so low. In this county we make more willow clothes-baskets than in all the rest of the United States. We handle at least 20,000 dozen each year. Some 25 years ago we began with handling 100 dozen a year. At that time willows were only grown along creeks and river bottoms. We now have great plantations. There is little money in the business, and it will not pay to raise them at any distance from a factory. L. L. T.
Syracuse, N. Y.

I KEEP my cows from sucking themselves by a simple device. Two leather straps, one inch wide, are buckled about the neck, one at the shoulder and the other just back of the head. To these, pieces of tough wood are fastened. The length of these pieces is arranged to suit the cow's neck from shoulder to jaw-bone. No chance for a cow to turn her head to the side, while she can move her neck up and down. W. H. B.
Iredell Co., N. C.

AFTER using the various preventives for grape rot, viz; paper bags, sulphate of iron, sulphate of copper, milk of lime and air-slaked lime, I find at least 90 per cent. of my grapes destroyed. The few remaining sound bags inclose sound clusters, but of 46,000 put on, not more than 1,000 are of service. The quality of the paper was too poor to withstand the rain and wind. I. C. S.
Aiken S. C.

OH for more fruit! Planters here with thousands of acres of land have not so much as a single peach tree. Blackberries and dewberries grow wild, but none are cultivated. I don't believe half the people know how strawberries grow. What fruit they use here is bought in cans. If they keep on, the next generation of Louisianians will want trees that bear canned fruit. T. W.
East Carroll La.

Sheep Husbandry.

MUTTON MERINOS: THE BLACK-TOP SHEEP: BETTER MUTTON AND WOOL.

COL. F. D. CURTIS.

IT is no wonder with me that Merino sheep fill so important a part in the sheep husbandry of the country. Now and then—rarely, however—some one has praise for them; but although the coarse-wools are much vaunted, the Merinos take the lead in numbers ten to one, and no doubt they will always exceed the others. To one who has kept both kinds the reasons are obvious. The Merinos will not only live, but do very well, under conditions where the open-wooled sheep would die. They seem almost to defy the storms and cold. The income from one sheep is not so much; but three, if not four, can be kept on the same amount of food which would be required to support two of the larger breeds. When this fact is taken into the account, the difference in the returns is not so great. American breeders should take hold of the problem and help to decide if the mutton qualities of the Merino cannot be improved. A real mutton Merino would be an ideal sheep, because it would be one which would be adapted to almost all parts of the country. Where vegetation is sparse sheep of this kind would deteriorate to a certain degree, unless extra food was supplied. The same is true of any large-growing breed of animals. Even Short-horns, when the pasturage is poor, will soon run down and become dwarfed, in spite of their propensity to rapid and large growth. The meanest-looking cattle I ever saw were some of these degenerated Short-horns. They had the expansive frames without the muscle and fat, and were not much more than living skeletons.

There has been no extended effort towards increasing the size of the bodies of the Merinos, as the efforts of Merino breeders have been more in the direction of securing heavy fleeces. Their success shows what skill may accomplish. In Washington County, Pa., for some years an effort has been made to increase the size also. A family of sheep were selected and named "Black Top Merinos," and an association of the best breeders has been formed to improve them both in body and fleece; in the latter respect not so much for weight as for quality. Individuals have also undertaken the same work, in different localities, to a small extent; but these Pennsylvania men have laid a broader foundation by a community effort, and are succeeding right well. They have already issued a herd book which does them great credit. There is no doubt that the character of the mutton of these sheep will also be improved, as the same law of improvement will apply with these as with all other animals. The famous South Downs were not once the desirable mutton sheep they are now, and the Leicester, the breed made by Mr. Bakewell, which for many years was called after his name, was built up from a much poorer foundation than the improved stock. Not only was the quality and the flesh changed and improved, but the fleece was also made much better. There is no impossibility about the improvement of the Merinos. The food has always a great deal to do with the character of the meat, and this law can be applied to the Merinos as well as to others.

A few years ago I started to breed a small flock of mutton Merinos from selected stock, and each year I am trying to show an advance towards larger bodies and more rapid growth. The enterprise involves care, selection and the application of the best principles in breeding. There must be established in them a constitutional aptitude for rapid growth, which is the opposite from the natural character of Merino, which is the slowest-growing sheep of all breeds. It is natural that the meat of these sheep should be dry and lacking in flavor when grown, as Merinos are usually reared on scanty pastures. I found that these sheep respond quickly to extra care, and that the quality of the mutton can be very much improved by feeding them roots and oil meal, which have helped so materially to improve the English breeds. The animals with gummy wool should be avoided in the experiment as well as those with wrinkles, and those only should be selected which, like the Black Top family, have white oil. These sheep do not have the rank smell of those with the yellow yolk, and their vitality is not drawn upon so much to furnish the yolk; neither do they secrete so much. They do not, therefore, coat the exterior of their fleeces with the dried oil, and consequently their wool is not so harsh and matted together. It is a longer staple, softer and more desirable.

SHEEP WASHING.

THIS subject has been discussed quite largely by wool growers in some sections this year, and many concluded to try the experiment of shearing their sheep without washing. It was an experiment which I don't think will be repeated; for but few would have tried it had they known how much loss they were to suffer by it. The old-time rule held to by buyers of the present day of deducting one-third for shrinkage of unwashed wool, is decidedly unjust to the wool grower. Here is my experience in this matter. My flock have averaged about 7¼ pounds of well washed wool for five years or more. With that amount of fleece at 27 cents per pound (which price it would have brought had it been washed), I would have realized $1.95 per head for the wool; as it was, I received less than $1.78 by selling it at 20 cents per pound. There is no doubt that the wool of some sheep will shrink more than that of others by washing; but in my opinion whoever sells his wool at a deduction of less than from 15 to 20 per cent. for the reason that it is not washed, is a loser.
Willow Creek, N. Y. W.

Dairy Husbandry.

COMMON-SENSE IN THE DAIRY.

Science undertakes to teach us a great many things about butter making. It is possible to be too scientific. With more common sense in the dairy, we should have fewer butter makers, but more good butter in the market. No set of dairy rules are worth a cent unless one is willing to temper them with common sense. A good sharp nose is often worth a $20 analysis. It is strange that people still think they can strain filth out of milk. It can't be done. Filthy milk will be filthy to the end of the chapter, and all the straining in the world will not make it pure. When a cow steps into the pail she steps into the butter plate. Milk collects all the foul odors about it and lands them safely into your mouth. When these facts are generally understood, there will be less trouble about "oleo." J. W. W.
Oceana Co. Mich.

MILK INSPECTION.

Milk inspectors examine the milk that goes into cities. They are anxious to see that it contains so much "solids." They would do the public a great deal more good if they would spend less time on the "solids" and more in finding out what the milk is made of. Disease is not poured into milk with water, but comes from feeding rotten and dirty food, or from filthy surroundings. If "oleo" factories are to be examined, why should not the barns where sickening milk is made be examined in the same way? The cry is that honest dairymen cannot compete with men who use cheap fats in making bogus butter. In the same way how can honest milkmen who feed pure, sweet grain, hope to compete with those who use rotten refuse or swill? Let milk inspectors extend their trips into the country and see what this milk is before it is milk.

BUTTER AVERAGES FOR HOLLAND CATTLE.

For the past 18 months we have tested 82 Holstein-Friesian cows and heifers in our herd for butter (which includes none of the records made prior to that time), and we find they make the following remarkable weekly averages: Five cows, 21 pounds 4-5 ounces; 10 cows, 19 pounds four ounces; 23 cows, 17 pounds one ounce; nine three-year-olds 13 pounds 2 1-5 ounces; eight two-year-olds, 13 pounds 1-8 ounce; 21 two-year-olds, 12 pounds 1-8 ounce; 37 two-year-olds, 11 pounds 4-5 ounces; 58 two-year-olds, 10 pounds 2-7 ounces. These facts show what selection, breeding and care will accomplish.
SMITHS POWELL & LAMB

The Poultry Yard.

A FEW SUGGESTIONS ON KEEPING POULTRY.

WE frequently see itemized statements of the enormous profits that can be made by running the poultry business on a large scale—"poultry farming" is the popular term. A recent writer in the RURAL set forth in glowing terms the result of $1,000 invested in poultry by a man "with any business gumption." Unquestionably, an experienced man could invest that amount and show handsome returns, but many a business man has not the practical knowledge of poultry requisite to engage in it successfully; and without this knowledge for a man to invest such a sum in the business, would be simply to afford another example of the truth of the saying: "A fool and his money are soon parted."

There are those who manage "poultry farms" successfully, and herald their triumph through the press. Of those who fail, however, we never hear, unless it be by way of an advertisement offering an incubator ("used but little") or other article for sale. My first suggestion to those who are beginning the business is, therefore, to be content to start on a small scale; for while there are a few who can run it on a large scale and make both ends meet, there is not a man, woman or child who cannot show a profit from a small number of fowls. I know of nothing which, on the actual capital invested, will bring such large returns as will 25 or 30 hens. The table scraps thrown away by so many families would furnish three-quarters of the food necessary for their maintenance, which is the secret of the profits from a small flock.

Our American fanciers have furnished us with a fowl exactly adapted to those who may wish to keep a flock that will furnish them with eggs the year round, and also with a chicken dinner of an excellent quality—a breed that requires no costly structure or artificial heat in order to lay well during the winter months, when eggs always command a high price and are too expensive for the laboring man's table. The RURAL has too often spoken of the great worth of the Plymouth Rock as a general-purpose fowl to make it necessary for me to say that it is also my ideal. The one important quality for a fowl to possess in order to be suited to the average poultry-keeper, is "hardiness," and I know of no breed that possesses it in so large a degree as does the Plymouth Rock. When one begins poultry-keeping, he should secure thoroughbred fowls, for he can't help but admire a flock of well-marked, symmetrical fowls, and he will therefore care for them the better. The stock will cost a trifle more than if a start were made with some common, worn-out stock, but the increased returns the first year will more than pay the additional outlay.
Cobleskill, N. Y. A. C. K.

A CHICKEN CURIOSITY.

I HAD a queer-looking chicken. It looked as though a hole had been made in its skin and then blown up like a bladder. It was one-third to one-half larger than it should have been. It was lively and the skin outside the air bladder full of veins. I pricked it over the left hip and let out the air, but the air around the neck remained. I pricked on the right side of the neck and the remaining air came out. In a few days it began to "blow up" again. As the result of a second pricking, it drooped and died. No bones were broken. I thought broken bones might have caused the trouble. R. E. D.
Tioga Pa.

GETTING RID OF GAPE WORMS.

YOU can get the gape worms out of a chicken's throat with a piece of fine wire. I take a piece about eight inches long, about as large as that used in making hair flowers. I double it and wind it on a stick, thus forming a loop which can be inserted in the chicken's throat. It is better than horse hair. Of the many proposed ways of curing the gapes, this one is sure anyway. If you get hold of the worm you can kill it at least. [We fail to see why dipping a feather in kerosene and brushing it about in the chicken's throat will not do the business. EDS.] P. S.

The Apiarian.

ROBBER BEES.

W. Z. HUTCHINSON.

SOME old man thus advised his son "Get money; get it honestly if you can, but get money." The bee always acts upon the principle of the above advice. It gets honey; honestly if it can, but it gets honey; that is if there is any to be got. It prefers to gather the sweet honestly from the flowers. During a good flow of honey I have seen it stand untouched in puddles on the ground where it had accidentally been spilled. But when the flow ceases, then beware! If there is a weak or queenless colony it is at once pounced upon, and a stout resistance

will be needed on the part of the inmates, or the robbers will carry away their hard-earned stores. If a comb is exposed, even for a few minutes, it is covered with bees eager to transfer its contents to their own combs. If a hive is opened, a crowd of robbers is soon on hand trying to force their way into the uncovered hive. At the close of the basswood honey harvest, robbers are usually the most troublesome. At this time, especially if the bees have become aroused by a taste of ill-gotten gains, it seems as though they would almost force their way through an inch board.

That "an ounce of prevention, is better than a pound of cure," was never truer than when applied to the robbing of bees. A taste of honey seems to arouse an almost demoniacal nature in them. If peace and order are desired, let not a drop of honey be exposed. Contract the entrance to all hives containing weak or queenless colonies. If necessary, the entrance may be made so small that only one bee can pass at a time. Queenless colonies should be given a queen, or some unsealed brood. If there is any colony that will make a weak defense, it is a colony with neither queen nor brood.

If a comb of honey should happen to be exposed for some little time until its honey is partly carried away, the most natural thing to do when it is discovered would be, of course, to remove it. Strange as it may appear, this is the worst thing that could be done. If left where it is, the bees will keep at work crawling over and examining the comb long after the honey is gone; finally they will gradually leave it, and are much more likely to go about their business than they would be were the honey removed. Then they seem to think they have made a mistake as to the spot where the honey was, and do not feel satisfied until they have forced their way into the nearest weak colony, or many bees have been slaughtered in the attempt. A weak colony that has been attacked and is succumbing, can sometimes be removed to a new location, and a hive with a little honey should be set in its place. The bees will soon clean out the honey, hang about the house for several hours until, concluding that that job is done, they will finally leave. Perhaps the best thing that can be done when a colony of bees is attacked and shows symptoms of being overpowered, is to wet several handfuls of straw or hay and place it in front of the entrance. The robbers, in trying to get into the hive, become wet, and this takes the fight out of them. One dry bee can "whip" half-a-dozen wet ones. For use when robbers are troublesome, a small tent, that can be set over the hive when handling the bees, is a great convenience. A light wooden frame-work, covered with mosquito netting, answers every purpose.

Field Crops.

MAKING AND PRESERVING PERMANENT MEADOWS.

HENRY STEWART.

Condition of meadow essential before seeding; general method of sowing grass seed; quantity of seed; Orchard Grass; Red Top; Blue Grass; seed for moist ground; seed for damp, rich land; seed for dry, sandy and gravelly soil.

WHEN the land intended for a permanent meadow, or indeed, for any meadow at all, is ready for the seed, it should present a level, smooth surface free from furrows or marks of any kind. When harrow marks are left on the surface, the seed will gather in these and the grass will come up in the lines of them, leaving these too thickly sown, and bare lines between them. This is especially objectionable when Orchard Grass is sown, for the habit of this grass being to grow in bunches, anything tending to increase the effect of this habit is to be avoided.

The sowing is to be done with the object of getting a perfectly even and regular distribution of the seed. This is effected by double-sowing as well as by careful scattering of the seed. It is better to take narrow strips and to be sure to leave no vacant lines between them. It is best to sow heavy and light seed separately, as the heavier seed will be cast further than the light. Moreover, the direction of the wind must be considered. It is best to sow across the wind. A broadcast seeder is very useful for sowing grass seed; but whether the seed is sowed with a machine or by hand, I would sow it double—one sowing across the other—and the clover seed should be sown alone.

My method is to use the first two fingers and thumb, and take up as much seed as can be held in that way for one cast, and to make a cast at every step. The steps are made by first advancing the left foot an ordinary pace, then bringing up the right foot on the line of the left, and as the right foot is moved to make the cast, throwing the seed up high and with a circular motion of the arm and a twist of the wrist, by which at the end of the cast and just as the seed is let go, the back of the hand is brought uppermost. This throws the seed in a level, broad sheet, which falls evenly from three to four feet on each side of the sower. A cast six feet wide is quite enough to make, and with the quantity of seed taken will use up a peck, or 15 pounds of clover seed and 12 pounds of Timothy, to the acre, which is the quantity I prefer to use, thinking some seed in excess is better than having too little. If less is sown, the pinch of seed may be made smaller and less taken at each cast. A very short experience will teach this part of the business to any man who can figure a little. A cast six feet wide will cover one acre in 2,420 yards, and exactly 11 casts across a 10-acre square field; or 22 casts across a square five-acre field 20 rods wide and long. Each pinch having one-fifteenth part of an ounce, or half a teaspoonful, will make up precisely 15 pounds of clover seed, and the same bulk at each pinch will expend 12 pounds of Timothy.

In sowing Orchard Grass seed, the quantity used is much larger, as two bushels per acre is the least quantity that should be sown This will give as much as can be taken in a handful with the third and fourth fingers kept always closed, and the seed grasped between the two first fingers and thumb and the palm of the hand. This will make a full tablespoonful to a cast. Red Top and Blue Grass are sown at the same rate, unless in a mixture with other kinds.

The choice of seed depends upon the kind of soil. Low, moist ground, that is overflowed at any time for a short period, is most suitable to Red Top (Agrostis vulgaris), Creeping Bent (Agrostis stolonifera), Fowl Meadow Grass (Poa serotina), Rough-stalked Meadow Grass (Poa trivialis), and Perennial Rye Grass (Lolium perenne), all of which do well on moist ground, and will not suffer from occasional flooding. Timothy will also do well on such land, and may be added to these in equal quantity; viz., an even proportion to make up two bushels by measure, or about 28 or 30 pounds to the acre. Orchard Grass does exceedingly well in damp, rich ground; but suffers from flooding. I have seeded a newly-cleared and drained swamp meadow with the above grasses, using six pounds of each to the acre, and it turned out very well, making an early and late crop of hay, and yielding fully three tons to the acre the first year, and before the grass had become firmly established. White Clover came into the drier part of this field naturally as soon as the drains had dried the land, and grew luxuriantly, making a thick, close bottom which helped the bulk of the crop considerably and improved the pasture afterwards. These grasses are in their prime from May to July, and the earlier ones are green again late in the Summer and in the Fall.

For drier land and sandy and gravelly soils, there is no better grass than Orchard Grass, and it is not improved by any mixture with others. It has a habit of stooling, or growing in bunches, but this is not particularly objectionable so long as the quantity of hay and pasture is satisfactory, and I have not yet known an instance in which any complaint of this kind has been made. It is no use fighting against Nature, and when the land is well prepared, the seed is sown as well as possible and covered evenly, and the grass *will* grow in bunches, it is foolish to make a fuss about it if we get the grass. Orchard Grass is ready for cutting—that is, in full blossom—at the same time as Red Clover, and if anything is sown with either of these it should be the other. But for a permanent grass I know of none better than Orchard Grass for hay or for soiling; and none for pasture, except Kentucky Blue Grass in those places only, however, where the latter thrives the best, as in the West and Southern mountains. Elsewhere Blue Grass will not afford as much pasture as Orchard Grass.

RYE.

A rye crop removed increases instead of decreasing the fertility of the land; on rich ground; excellent feed for horses; as pasture in Fall and Spring; as green manure—how to use it; the straw for binding; in a rotation.

FARMERS do not give this crop the attention it deserves. As a general rule, it does not yield as much per acre as wheat, and sells for two-thirds to three-fourths as much per bushel. The reason it does not yield as much is because it is usually sown upon ground too poor for wheat; but it yields a tolerable crop where wheat would yield next to nothing. Many of the old Dutch farmers who have long been in the habit of raising it, assert that a crop of rye taken off a piece of ground, instead of taking from, adds to the fertility of the soil. They argue that in seeding down with wheat, they often fail to secure a "catch" of grass; but by plowing down the wheat stubble to follow with a crop of rye, and seeding to grass with this, they invariably secure a good "catch" of grass, as well as a good crop of rye, and the ground is in better condition than it was before the rye was sown. Whether there is anything in this theory or not, I do not say, and yet the practice of such farmers would seem to confirm the faith that is in them.

Rye sown upon ground rich enough for wheat yields as much grain as wheat, and nearly double as much straw. Rye bread, when properly baked, is very wholesome and nutritious, and many people are very fond of it. Among the Dutch farmers in the eastern part of Penn., it is mostly used as chop to make cut feed for their horses, either pure or mixed, and chopped with other grains. The straw is run through a cutting-box, and about half a bushel of this cut straw wetted, and mixed with two or three quarts of rye "chop," fed to a horse three times a day, gives better satisfaction, and answers every purpose of both oats and hay. Especially is this the best kind of feed for a horse troubled with heaves. A pint of boiled rye fed twice a day is unsurpassed for putting a horse in condition, also calves, and cattle that have become hide-bound.

Then for tying up corn-fodder, it is almost impossible to get along without rye straw. Of course the crop must be thrashed out with a flail if the straw is intended to be used for this purpose.

As a green crop to plow under I find in it, perhaps, its greatest value. In this country, buckwheat is a standard crop in our rotation. After the corn is off, I sow rye [as it will do to sow it quite late even on the snow, and not harrow], to be plowed under about the middle of June; pack it down tight with a roller after it is plowed, then about June 20 sow buckwheat. This comes off so the ground can be ready to be sowed to wheat about September 20. Then I plow it again before sowing wheat, and roll; thus the rye that has been turned under in June, (quite a furrowful) comes on top, like well rotted manure, to top-dress the wheat. By fastening one end of a log-chain to the doubletree, and the other end around the beam of the plow, letting the chain drag in the furrow, every stalk can be covered out of sight; in fact, it makes it very pleasant work. Last Summer I raised 120 bushels of buckwheat off three and one-half acres, where rye had been turned under in June. It was all ripe before September frost, and buckwheat was buckwheat.

It will make good pasture for the calves this Fall, and I expect it will again next Spring. I may use a part of it for soiling purposes, and turn under for buckwheat, to be followed by wheat.

Some agricultural papers recommend the sowing of rye with a view of plowing under for corn. I do not hold very much on that line. Unless it is sowed very early, it will not amount to very much in time to plow under for corn, and you cannot get any suitable ground for corn on which to sow it early, except sod after harvest. If that sod were simply let alone, the grass that would grow up and rot down in the Fall and grow up again in the Spring before plowing for corn, would need far less work, and amount to more than the rye would by the time to plow for corn, as it is after that time rye makes its most rapid growth. Upon any other than sod ground, of course the benefit will be in proportion to the amount of growth secured by the time it is plowed under for corn.

Venango Co., Pa. T. S. STROHECKER.

MILLET.

MILLET will produce from two to four tons of cured hay on an acre of well-manured land. The common or Golden Millet is the best variety. It grows taller and with a finer stem than the German which looks like diminutive corn, and is two weeks later in maturing. Millet is better for stock than corn-stalks, when not allowed to get too ripe. It is a superior food for milch cows Seed is cheap, sold by all seedsmen. It is a good food for poultry, particularly for young chicks. From 10 to 12 quarts of seed per acre are ample on rich land. More seed will prevent too coarse a growth of stems. For sheep, the ground should be thickly seeded so as to make the hay finer. Seed should be covered slightly. Rolling will do the work well. Golden Millet will mature in two-and-one-half months. Always cut before a frost.

Saratoga Co., N. Y. F. D. C.

ALSIKE.

IT is well known that Alsike Clover, a hybrid between White and Red Clover, is one of our most desirable honey plants. By feeding in Spring, it can be made to blossom late, and it furnishes most excellent honey in great quantities. It is excellent for hay, being finer and of better quality than Red Clover. The blossom is pink, and in beauty and delicacy of perfume a field of Alsike Clover in blossom is hard to excel. Col. F. D. Curtis, in a late Country Gentleman, adds another virtue. He says the Alsike lasts much longer than Red Clover. As bees work on Alsike, the first crop of seeds develops which self-seeds the land, and continues the plants, which is not true of Red Clover. A. J. COOK.

Indust'l Societies.

SOCIETY NOTES.

The annual meeting of the American Horticultural Society, for 1886, will convene in the city of Cleveland, Ohio, September 7, next, and continue three or four days. This is expected to be one of the most important meetings of the kind ever held in this country. W. H. Ragan, Greencastle, Ind., Secretary.

The next annual meeting of the American Forestry Congress will be held at Denver, Colorado, Sept. 16-18. A better place for holding the convention could hardly have been selected. The members of the congress will both instruct and be instructed. If any portion of America stands in need of trees it is the "Great American Desert," and yet in the cities and towns where irrigation is practiced the trees are almost unapproachable for beauty. The question of preserving the forests of the Rocky Mountains is also of great importance. B. F. Fernow, Washington, D. C., is secretary of the congress.

The Kansas City Fat Stock Show will be held this year Oct. 23-30. Entries of fat stock promise to be large. The various cattle breeders' associations of the country have voted to duplicate all awards made at the exhibition, so that an animal winning a prize here will bring its owner a good sum of money. Many manufacturers have also offered implements to be given to the owners of winning cattle, both thoroughbreds and grades. The practice of offering prizes for graded cattle is a good one. The grade is the "farm breed" at present and deserves more encouragement. This fat stock show has heretofore been weak in its display of hogs and sheep. We hope to see a better representation of these animals this year. J. W. Sanborn, Columbia, Mo., is secretary of the association.

The Society of American Florists will meet this year in Philadelphia, Pa., Aug. 18, 19 and 20. The meeting will be very attractive to those who love flowers—and who does not? E. G. Hill, Secretary, Richmond, Ind.

THE Teachers of Agriculture met in convention at Perdue University, La Fayette, Ind., last month. Teachers and directors of Western experiment stations were present. These conventions are in the line of social talks. The object is to meet and exchange views in an informal way, make suggestions and criticisms, and to endeavor to arrange something of a uniformity in experimental work. A great deal of good has been done, in a quiet way, by this organization, and it would be well if our Eastern agricultural teachers could unite with those at the West, and thus make the society more national in character. The great object of the authorities of an agricultural college is to enlist the sympathies of the farmers. Without this sympathy they lose the best part of their work; with it they cannot fail. This question was discussed at the convention at La Fayette. The holding of Farmers' Institutes in different parts of the States was considered a most effective way of advertising the colleges. The institutes for the first year may not be largely attended, but by perseverance they can be made popular. Experimental work was also commended, particularly for the newer States, where there are fewer agricultural facts on record. Land in many parts of the country has gone through the various stages of decline and restoration of fertility. In many parts of the West this change has not been made, and it is the great duty of experiment stations to collect and digest facts from all sources, and present their results in a plain and readable form. Several speakers said that a college farm must be made to pay as a business venture before a certain class of farmers could be induced to send their sons to the college. The idea seemed general that more actual good could be accomplished by running the farm for experiment rather than for profit, but that the prevailing spirit among many farmers rendered it necessary to conduct most college farms on a dollar-and-cent basis.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

REPORT OF THE WISCONSIN EXPERIMENTAL STATION.—This experiment station has been of real value to the farmers of Wisconsin. The aim has been to condense the work of the station and combine its efforts in working out a few particularly important questions. Wisconsin agriculture has reached a point where a radical change is demanded. An exclusive grain growing has reduced the fertility of the soil. This fertility must be restored, and the officers of t'e station have wisely decided to make this question of restored fertility the leading one in their work. Naturally the feeding of cattle suggests itself as the most available agent in this work. It is a generally understood principle among good farmers that the fertility of a farm will be measured by the number of stock fed upon it. Commercial manures have, in some portions of the country, made it possible for farmers to produce bountiful crops with little barnyard manure, yet in the newer portion of the country, and on large farms, farm manure must still be depended upon almost exclusively. The work of the station has been extremely practical. Efforts have been made to ascertain the feeding value of sweet skim-milk for young animals, the value of the corn crop as fodder, the value of oil meal, bran, and other feeds for milk and butter production, etc. This work has been well and carefully done, and will be of value to Wisconsin farmers. There has always been a question in the minds of farmers as to the best method of feeding corn-stalks. It is easiest to feed them whole, but is it most economical, taking into consideration the trouble of removing the wasted stalks, in handling the manure into which they have been thrown, and even the feeding value of the refuse? Prof. Henry tested the matter carefully. He concluded that if ordinary corn-stalks were worth $4 per ton, the cut stalks were worth $5.20 for feeding. The farmer must decide for himself whether it will pay to cut a ton of stalks to save $1.20 in feeding value. We notice that in this experiment little notice was taken of the fact that the cut stalks make far better manure and that a larger proportion of the fodder is used up in this way. We are inclined to think that it will pay better to feed the stalks whole and to use the refuse, as Prof. Shelton, of Kansas, suggests, for fuel in heating drinking water for cattle. We speak now of stalks from which the ears have been husked. For ordinary fodder corn, grown in drills and fed ears and all, better results may be expected, but it is hardly thought, even in this case, that the cutting of the stalks would pay. Prof. Henry calculates that an acre of uncut stalks, without the grain, supplemented by 1,690 pounds of grain feed, will produce 158 pounds of butter. This grain feed is given as five pounds of bran to five of corn meal and two of shorts. An acre of drilled corn fodder, fed ears and all, uncut, with 2,256 pounds of bran, will make 290 pounds of butter. These facts are of great importance to Wisconsin farmers. Tons and tons of bran are shipped through the State to be fed out at the East. Acres and acres of stalks are wasted. Both of these sources of wealth should be utilized in the only practical way, viz.: in cattle feeding. Prof. Henry made an experiment to determine the value of soiling as compared with pasturing for dairy cows. We shall give the substance of his conclusions in a subsequent number. We commend this volume of experimental results to our readers. It is well worthy of study.

KENTUCKY HORTICULTURE.—PROCEEDINGS OF THE LAST MEETING OF THE KENTUCKY HORTICULTURAL SOCIETY.—We are indebted to our friend, Judge W. L. Dulaney, for this report, from which we learn much of the horticultural development of Kentucky. The meeting was well attended and the papers prepared were of interest. President Cook well said that he who gathers the fruits others have planted, only half enjoys them. The raising of Bartlett pears was said to be a very profitable business. Few precautions are taken to suppress the attacks of insect enemies of fruit trees. Farmers combine their energies against the tobacco-fly, thus protecting a crop that really pays less than a fruit crop would pay. In one Congressional District of Kentucky, 300,000 bushels of apples were distilled into alcoholic spirits, while but 5,000 were put through the evaporators for food. The Concord appeared to be regarded as the "general-purpose" grape. This advice, "if any of you haven't a grape-vine, plant one, and if you can plant but one, plant the Concord," appeared to be satisfactory, though Iona, Pocklington, Niagara, and others were mentioned. Members were advised to make use of old and standard horticultural literature, and to let private circulars, essays, etc., alone. Wild cherries were considered a popular fruit for birds, hogs and some boys. It was suggested that a few trees growing near the orchard might attract the attention of the birds from the other fruit. It was thought that sheep were the best scavengers to put in an orchard, but it is well to take them out before snowfall, otherwise they will nip the shoots and bark the trees. A story was told showing how, in old times, an orchard was renewed. Two or three loads of manure were put under each tree. In the Spring, with a stout staff, many holes were punched in the ground and half-a-gill of corn was dropped into each, and the openings closed. The hogs were then turned in, and they fairly turned the soil upside down and covered the manure in hunting for the corn. As a substantial beginning towards a better horticulture, it was suggested that each member of the society go home and proceed to turn his place into a small Eden, without a single tree of any forbidden fruit. The fruit tree peddler came in for his usual round of abuse. The President of the society was not ashamed to confess that he had paid out money for blue and green roses, strawberries that grew on bushes, and similar monstrosities. He has never seen them yet, and his money has not returned. The home nurseryman was informed that in order to cope with these glib-tongued fellows, he must show more enterprise, spend more for printers' ink and let people know what he has to sell and how he proposes to deliver it.

IMITATION DAIRY PRODUCTS.—Under this title is collected the testimony given before the Senate Committee on Agriculture in reference to the Oleomargarine Bill. That the hearing was extended and exhaustive may be inferred from the fact that the testimony fills a pamphlet of 275 pages, and fully covers every phase of the subject. As we have frequently stated, we do not think any measure has of recent years been brought before Congress, that is of more vital importance to the farming interests of the country than this. The question should be carefully studied. We advise farmers to secure a copy of this report. It can be obtained through their Senator or Representative.

What Others Say.

A CORRECT NOMENCATURE.—We find the following in the Philadelphia Weekly Press:

"As to hybrids, the Editor of the R. N-Y, makes protest against the free use of the word "hybrid," and wishes to restrain nurseryman and florists from characterizing the offspring of two varieties of the same species as a hybrid. He even goes so far as to accuse offenders in this respect with a lack of regard for "truth and propriety," and calls on various associations and societies to take action in the matter. But some people argue that a true hybrid has no power of reproduction any more than a mule has. And what is a variety or a species? Who is to decide? It is a matter of judgment only. New species and new genera are being erected constantly by botanists. When a florist or nurseryman or an amateur speaks of "hybridizing" for pastime or any other purpose, it is understood that the word covers the crossings of plants, whether nearly or more distantly related. It is not a serious offense against good taste or good morals to use any word in its ordinary, current meaning."

We are sory that our respected contemporary takes this view. We had thought it was a part of the duty of the press to point out errors just as much when they have become "current" as when they first appear. The words hybrid and cross-breed are as distinctly defined in botanics as are the words genus, species and variety. It does not matter whether or not we know what constitutes a genus, species or variety. Until we *do* know there is but one rule to follow, viz., the teachings of our leading botanists. According to such teachings the word hybrid and cross-breed are not interchangeable. Dr. Gray says (Structural Botany page 136) that "cross-breeding is effected by fertilizing the pistil of one variety with the pollen of another variety of the same species." Again he says that the "cultivator often proceeds one step further," in certain cases, "and gives rise to a different kind of *cross-breeds*, viz., *hybrids*." Again he says: "Hybrids are cross-breeds from different but nearly related species."

Sachs says (p. 816 Text Book of Botany): "We learn from experience that a fertile sexual union can take place between plants which are specifically distinct. A union of this kind is called hybridization and its product a hybrid." He proposes three words to express the results of a union between, (1) different varieties of one species, (2) different species of one genus, and (3) two species belonging to different genera, viz., variety-hybrid, species-hybrid and genus-hybrid. But such a set of terms would not help matters much. In the meantime we can do no better than to follow our own botanical authority, Dr. Gray. Pupils who study his text-book will naturally ask what is meant by hybrid corn, potatoes, hybrid cucumbers, tomatoes, peas, beans, squashes, peas, etc., when first they examine the catalogues of seedsmen and nurserymen or the rural journals and books of the day. They have to learn that the word "hybrid" has been substituted for "cross-breed" because it is a more *taking* word. In like manner we have pointed out the undesirability of calling all chemical fertilizers "superphosphates" or "phosphates." Nothing is more perplexing to the farmer who is trying to comprehend the whole subject of concentrated manures than the "current" signification of these words, for the reason that they are used by garrulous agents, and even manufacturers, in a sense quite at variance with their real meaning.

DECLINE IN STOCK VALUES IN GREAT BRITAIN.—English journals are lamenting the present general, and in some breeds serious, decline in values. Prices have shown a downward tendency for years. This was natural, from the fact that the demand, particularly for bulls, becomes year by year better and better supplied. But the decline in Scotland in 1885, says the North British Agriculturist, was the most unsatisfactory on record. This is clearly illustrated from the fact that while 18 head more of Scottish cattle of pure-bred stock were brought into the market last season than the previous one, something like £15,224 ($76,000) less were realized. It will be interesting to herders in the United States to know the impression in Great Britain in relation to depreciation. In this country the area to be supplied with pure-bred stock is immense. Prices have declined. As prices fall in the Old Country they must fall here, but this fall in prices will stimulate buying among a class of farmers who were not able to pay the great prices of previous years. In fact, the fall in prices in this country has already stimulated buying among farmers who heretofore seldom sought blooded stock. The Elgin (England) Courant and Courier gives its opinion of the causes of the decline, and in summing up says:

"The great importance, both financially and otherwise, to the country, of the trade among pure-bred stock will be gathered from the fact that last season no fewer than 1,610 Short-horn and polled cattle were spread over the northern counties, the total price realized for which was over £34,502. The previous year—season 1884-'85—1,592 animals brought a total of £49,427, which result has, as noted above, entailed a loss to breeders for the year of no less than £15,224. As a comparison, in the years 1883-'84 the sum paid for pure-bred stock in the same area was £37,409; in 1882-'83, £36,409; 1881-'82, £30,168; 1880-'81, £26,802; 1879-'80, £25,503."

The fact that about $100 each are realized for all cattle sold—good, bad and inferior, young and old—will not strike the average reader as being exceedingly low for stock from herds that have already made their owners rich.

Polled cattle seem to have depreciated most seriously. The average price paid in 1885-'86 less than in the year previous, was nearly £12 ($58.35), the average for polled cattle being nearly £22 9d. In only three instances did the price reach those figures.

Depreciation in Short-horn cattle was less than in polled cattle, but there were fewer public sales of these than of polled cattle. The speculation in polls in America probably caused them to be forced upon the market beyond a legitimate demand. Short-horns in no case are reported as bringing these figures, £84 being the highest price recorded by the contemporary named.

In conclusion, it is stated that Short-horn bulls in 1885-'86 averaged £19 11s, as against £28 5s 1d last year. Cows this year only averaged £22 13s 1d, whereas last year the average was £31 3s 7d. Two-year-old heifers showed the least difference in price. Last year they averaged £23 17s 5d, while this year they were £23 15s 9d. Yearling heifers on the other hand, were somewhat down. Last year they averaged £18 15s 7d, while this year they brought only £16 9d. Calves were much the same as last year.

TURNIPS AS A FIELD CROP.—Waldo F. Brown says, in the Farmer's Review, that for 25 years he has not made a failure with the turnip crop, and with the exception of perhaps two years, he has grown from 100 bushels up to as high as 1,500 each year. Although some years he has not been able to sell, and so has fed them to his stock, in other seasons they have paid him a larger net profit than any crop grown on the farm; and taking the years one with another, he has found an acre or two of turnips to pay better than most farm crops. He remembers one year that he sold a carload of 400 bushels at 33⅓ cents a bushel, on the track at his station, and as he was loading the car, was frequently asked by farmers the price and several times when he told it they said, "Can you make anything growing turnips at that price?" It so happened that corn was selling at the same price, and Mr Brown said to them, "You grew on an average less than 50 bushels of corn the acre, and gave it the entire season and several thorough workings; I grew an average of 200 bushels of turnips to the acre, and grew them as a second crop and gave them no cultivation at all.' Mr. Brown says that 200 bushels is a very moderate crop, and that he has grown 500 bushels on an acre of highly manured land that had grown two crops besides the same season, the first crop being early peas that were marketed by June 11, and the second crop pickles, and the turnips were sown about the 1st of August at the last working of the cucumbers. He believes that it is easier to grow 1,000 bushels of turnips on an acre than 100 bushels of corn.

As to the the time of sowing, the old New England couplet says:

"Twenty-fifth of July,
Wet or dry."

But the first 10 days of August is the best time for the latitude below Central Ohio, and Mr. Brown has grown excellent crops sown as late as September 1; but he would always advise sowing by the middle of August, as the Fall must be unusually favorable if a later sown crop matures so as to be gathered before cold weather. Another important direction as to the "when" is, *always sow after a rain*. The majority of farmers think it a nice saving of labor to sow turnips when they see a rain coming up, so it will wash in the seed and save them the trouble of covering it. It is the worst possible time to sow, and has caused the loss of many a crop. There are two good reasons for this. First, a rain always brings up a crop of weeds, and when they start with the turnips they always damage the crop. The second reason is, that a heavy rain packs the soil and forms a crust, and prevents the plants from making a thrifty start, and it is not uncommon for insects to destroy the plants almost before the eye can detect them; while if sown as soon after a rain as the land can be worked, few, if any, weeds will start with them, and they will make so vigorous a growth as to escape insect pests. The first 10 days is the critical time with the turnip plant, and it makes quite a difference whether during that time it is choked with weeds and bound by a hard, dry crust, or growing in a clean, moist and mellow soil.

Mr. Brown prefers to sow broadcast, and use no mixture of any kind with the seed. Use only the thumb and forefinger and sow a strip five or six feet wide, making one cast to every two steps, and you will not be likely to get them too thick. About one pound to the acre is right. Should the turnips be too thick they can be thinned by running over them with a light harrow, and the best time to do this is on a bright, sunny day, when the plants are two or three inches across. Run across with the harrow, and then wait a few moments to see how many plants wilt, and if once does not thin them enough, cross-harrow. A single plant to the square foot will give a larger crop than closer planting, and if he were growing for stock, and the land was rich, he should expect the largest crop from about one plant to each two square feet; but as a large turnip does not sell well in the market, when growing them for sale he leaves them thicker, say two plants to the square foot, and then gathers the larger ones as soon as the weather will admit, and lets the smaller ones grow longer. There are 43,560 square feet in an acre, and the legal weight of turnips is 50 pounds to the bushel. If we can grow a turnip weighing one pound on each square foot, it will give a crop of nearly 22 tons to the acre, or 871 bushels. He thinks it would be easier to grow turnips that would average two pounds each with two square feet to each plant, than one pound each with one to each foot. A compact seed-bed is absolutely necessary for turnips. The land should be plowed at least a month before sowing, and two months are better, and by the use of roller and harrow, it should be made fine and solid. When the time comes to sow, harrow so as to make two inches of the surface mellow; then sow the seed and cover with a light plank drag: this will cover the seed lightly and press the earth to it so that it will germinate at once. A crop of clover may be cut for hay and the stubble turned under in June, and at once rolled and harrowed flat; then during July top-dress with six or eight loads of fine manure, and harrow till thoroughly mixed. If the land is rich it will grow a good crop without the manure, or there is perhaps no crop on which commercial fertilizers can be used with as great certainty of good results as on this. Unlike beets and carrots, turnips are in the best condition for feeding in the early

part of the Winter, and will be valuable in finishing off beeves for the Christmas market, but if pitted they will keep in good condition for spring feeding. A little freezing, if not disturbed till thawed, does not hurt them. Pit them on land with a gentle slope, plow four furrows ten inches deep, and throw the loose earth out at the sides, then pile the turnips in the trench so the top will be about three feet high and the sides slope at an angle of 45 degrees, and then throw on the earth. It will take from 20 to 25 feet of pit to each 100 bushels, and a man should cover 500 bushels or more for a day's work.

BRINE FOR BUTTER.—A writer in the Husbandman who sells his butter for nearly twice quoted prices, prepares brine for butter in this way: He takes the best dairy salt and stirs in hot water as much as can be taken up or dissolved and a little more. When thoroughly stirred, so that the brine has become as strong as it can be made, he strains it through a tightly woven cloth, and then sets it away to cool. When cooled he pours it on the package, if a firkin, to the top of the chime that the supply may be sufficient for entering every vacant place. The same process is required when butter is packed in a jar or tub, the purpose being to exclude air, the brine serving this use effectually, and at the same time keeping its strength and operating in some degree as a preservative.

THE HOME-RAISED DAIRY is Mr. John Gould's ideal. The dairy of the future, he says, in the Press, must be bred for a specific end, butter or milk, and who can do this as well as the farmer, who knows just what he wants, and can direct his breeding in the line of closest adaptation to his needs? He need not pay the top price for fancy stock, but he can discard the nondescripts that are only profitable on $20 land and $3 hay. By careful selection he can breed up steadily so that more milk or butter will be produced by fewer cows. And, more than this, his dairy will supply something besides milk or butter. For the increase of this home-bred stock can be turned to profitable account. The slaughter of baby calves three days old will cease when the dairy is what it should be and the demand for good veal, and even of beef, can be supplied by dairy farmers at a profit.

The home-raised cow possesses many advantages over one that is purchased. The owner then knows her peculiarities, and can fashion her habits. Each one of Mr. Gould's little dairy of 12 animals is descended from one cow, the most perfect animal he ever owned, and his bull on one side inherits all these good qualities, and the result is that uniform messes of milk are received, varying one from the other scarcely more than a pound or two at most.

Then "breaking heifers" is unknown. When they come into the dairy all Mr. Gould has to do is to sit down and milk them. There is no tying legs, kicking over pails, or Indian club practice with a milking stool. The Winter before they calve the heifers are stabled with the cows, and are treated exactly as the cows with respect to care. Every few days he plays at milking them, handles their udders, teaches them to "histe," and when they are milkers they are cows in habit at once. Such a dairy is quiet, home-loving, and never breachy. They have their place, know it, and then one knows their qualities and worth, which he can never do when he steps into a "drift" herd to select a few "choice" cows for his dairy—cows about which he has not the remotest knowledge, and which when purchased three times out of five fail in meeting expectations. After 30 years' experience Mr. G. votes for the home-raised dairy every time, fully believing that the successful dairyman of the future will breed his own cows.

LITTLE PROFIT IN COTTON.—Our friend Henry Stewart, who is at present farming in North Carolina, says that the figures relating to the present cotton crop afford a most noteworthy example of wasted labor and resources. The area reported under cultivation is nearly 19,000,000 acres, and the expected crop 6,500,000 bales, which is one bale to three acres, or 150 pounds per acre. A Northern farmer or a thoughtful Southern planter should consider these figures with amazement. 150 pounds at the present price represent about $8, for which the planter spends $2.75 for fertilizer, $2.60 for rent, and pays out of the rest for all the work of planting, picking, ginning and baling the product. All this work must come out of the paltry sum of $2.65 per acre. As this is the average, and much of the crop must yield less than this, what a sorry recompense the poor cotton-planter gets for his exhaustive and long-continued work, lasting nine months in the year, before his crop makes a return!

LIGHTNING rods are now said to be simply dangerous. That is, a house furnished with rods is more liable to be struck by lightning than one without rods. It is said that insurance statistics prove this. "There's a pretty state of things!" The real trouble is that the lower ends of the rods are not properly "fixed." They should be embedded in moist earth, or be in connection with metalic pipes, or with a sheet of metal sunk in damp ground. In the ground they should branch out some distance, and charcoal, which is a good conductor, should be filled in round the branching rods. The rods should be made of pieces as long as possible; and unavoidable joints should be securely fitted so that the two ends are brought into close contact, and touch each other for several inches. Iron rods loosely joined together and resting in the joints furnish a bad conveyance for the electric current, and the lightning may dart off to some better conductor in the building, causing much damage in its course.....

A WRITER in the N. E. Homestead says that he has a small cold storage house that is inexpensive and adapted to the needs of the average farmer. It is 16 feet square, with a dead air space between the walls filled with sawdust. In the middle is a room 10x10 feet and six and one-half feet high, the ice being packed all around and above it. There is a passage way from the outside door to the door of the refrigerator room. He says that every ice house can just as well as not serve also for a cold storage house by the use of this system. It will keep strawberries for six weeks, raspberries and blackberries fully as long, Astrachan apples until Spring and Bartlett pears until Christmas.....

THE RURAL'S LUNCH.

F. D. COBURN, a good authority, says that the flavor of the pork depends on the last month's feeding of the pig.....

THERE seems an unaccountable discrepancy between the treatment of fever in swine and in the case of a human being suffering from the same disease, says a writer in the London Ag. Gazette. In one case we do everything possible to cure the patient, and condemn everything doubtful in the way of closets, drainage and ventilation: in the other, we condemn the animal to immediate slaughter and allow the suitability of the sties for receiving other occupants to remain almost unquestioned.....

THE value of crude petroleum to the farmer, stockman and shepherd can scarcely be overestimated, says a writer in the Times. It is most excellent for painting tools and implements, as well as board fences, farm buildings and the inside fittings of stables. It is the most effective and safest remedy to apply for external parasites, as lice, fleas and the scab and mange insects, curing the destructive sheep scab better than any other known remedy, and preventing it most effectively if applied twice a year. If used after shearing, it cures the unavoidable cuts made by the shears and keeps off the flies from the wounds, as well as protects the shorn sheep from the weather and the contagion of the scab. It is cheap, and every farmer should keep a barrel of it on hand for these and other valuable uses.....

SCENE—An editorial sanctum, editor writing at his dest, enter manager of the advertising department, rubbing his hands expressive of intense satisfaction:

Editor: "Well, Mr. Space, what is it?"

Mr. Space: "I have just closed one of the largest and best advertising contracts I have made since the paper started."

Editor: "Indeed!"

Mr. Space: "Yes, and it will run for a year."

Editor: "Who is the party?"

Mr. Space: It is a big Kentucky firm, you see, and they are booming their Pure, Copper Distilled, Instant Death Whiskey. They are the biggest advertisers in the country today."

Editor jumps to his feet, hurries to the pipe connecting with the composing room, and shouts, "Foreman!"

"Hello!"

Editor: "Have you got my editorial "Death to the Whisky Traffic" in type?"

Foreman. "Yes, and I am just putting it into the forms."

Editor (vehemently): "Kill it!"

The above was sent to us by a friend without credit .....

WE shall all rejoice when we see signs that the conflict between Labor and Capital has narrowed itself down to the true issue. "Puck" says there is no real conflict, and that there can be none. So long as one man has money, and another man wants to get money, so long will the man with money buy the labor of the man without money.....

THE "worst bird-enemies are women" is the caption of an interesting article in proof of it in the N. Y. Tribune.....

IT is a disgrace to civilization, the article says that American women are more deadly than European sparrows against our native birds. Millions are shot every year for feminine head-dressing. The slaughter has reached the South, where some of the birds are gorgeously plumed.....

THE damage to crops by insects is enormous and if the destruction of birds is continued, by and by there will be no fruit, and the garden, grain and grass crops will suffer more and more. He has posted his land against hunters and proposes to enforce the law rigorously and so preserve the valuable birds, and he earnestly advises all other farmers to do the same.....

IT appears that carp do bite at bait .....

A TEASPOONFUL of turpentine in a pint of meal made into a dough and fed to chicks is said by the Poultry Keeper to be a cure for gapes.....

MR. J. H. HALE while traveling West noticed in Ohio and Indiana several large fields of sunflowers, and states in the Homestead that they were grown as food for poultry. A farmer who has tried it for years told Mr. Hale that he can grow more bushels of sunflower seed per acre than he can of corn, and it is worth about double for laying hens.....

THE National Live Stock Journal thinks much of the opposition to the Bureau of Animal Industry is due to the manner in which its work has been done in the past, and to the character of some of the men connected with it, and that a radical change in this respect is needed to secure the hearty support which public measures like the recent legislation in support of the Bureau, should have.....

IN his testimony in favor of oleomargarine before the Senate Committee, Prof. Chandler acknowledged that he expected to get pay for his evidence, and that while oleomargarine could be got for 18 cents a pound, he paid 80 cents for the butter used in his family, although "oleo.," according to him, is "chemically pure and wholesome," better, indeed, than butter..

PROF. MORTON, before the same Committee, while giving similar testimony for similar pay, acknowledged that he couldn't tell by chemical examination whether a hog died of disease or a natural death, yet he declared that oleomargarine made of hog's fat is "healthy and pure, chemically." So there might be in the fat germs of disease in the worst form, yet the Professor's tests could not discover them. Doesn't all this show how utterly worthless is the testimony of chemical experts before the courts? They can testify for whichever side pays them best! .....

MR. C. G. PRINGLE, the naturalist, has a good word for the much abused daisy. At work the other day in a field of them, he said: "These daisies are not half appreciated. They never fail us in a dry season, and they will grow and thrive on soil where other forage plants could scarcely maintain even a sickly existence. Cut early and cured quickly, they are sweet and nutritious for cattle and horses, and stock will eat them with relish. They deserve to be more kindly viewed and treated." .....

CHICAGO Live Stock News says the dressed beef combination has done greater injury to the live stock trade of Chicago and the West than all the other rings that ever had an existence, and it is becoming more powerful, more exacting, more dangerous every day.

Everywhere.

TRANSCONTINENTAL LETTERS.—LVIII.

MARY WAGER-FISHER.

Marysville; Sacramento City; the Crocker Art Gallery; the Chinese quarter; Stockton; on the way to Oakland "the most beautiful city in the United States."

When we arose in the Marysville hotel next morning, we were "specked beauties" in a high degree, our sunburnt faces having been profusely bitten by mosquitoes. It was quite the finishing touch, but we found that comfort in the fact which is always to be had when the "worse has come to the worst." It was a cool morning, and as the train we were to journey in left soon after breakfast, our only view of the city was from the hotel 'bus—used here without the apostrophe—in the rather long ride to the station. There was nothing particularly distinctive—orange trees loaded with fruit and oleanders with blossoms. Our succeeding destination was Sacramento, the capital of the State, which we reached at eleven in the morning. The country between these two cities is less level and less attractive than that we had seen on the previous day. Much of the soil seemed to be in a sort of semi-disintegrated state, the surface being a succession of small hillocks, and much of it billow-like, with a sparse covering of fine brown grass.

Sacramento is the second city of importance in California, and its handsome granite State House is a matter of pride for the whole State. It was the first thing we visited, the laddie and Anaximander climbing to the very top of the dome, while I halted at an outside gallery surrounding the "cupalo" as nine persons out of ten call the cupola. The location of the city is in a great level plain with the mountains far away in the distance. It is well shaded, and has many attractive homes. In the rotunda of the State House is a marble group representing Isabella and Columbus—the Queen showing him her jewels, which she would pledge—the work of the sculptor Larkin G. Mead, and the gift of D. O. Mills, one of the rich Californians who have gone to live in New York; and it goes without saying that men who have grown rich here, and then gone elsewhere to enjoy their wealth, are not in high favor with Californians who stay in the State. The grounds about the State House are not yet entirely in order, but are sufficiently so for one to compare the geometrical style of landscape gardening with the curved lines so often quoted from Ruskin as being those of beauty. Here, at least, the straight lines, the parallelograms of grass, the square corners and triangles, were, to my eye, far prettier than the grass through which meandered winding walks. The great and surprising variety of evergreens that here bedeck gardens and lawns, and which are trimmed to suit the gardener's caprices, produce an oriental effect that seems altogether foreign. There is a large variety of palms and undeciduous trees so novel and beautiful as to exhaust one's adjectives in a very short time.

Much of the afternoon of our day in Sacramento, we spent in the E. B. Crocker Art Gallery. E. B. Crocker was a brother of Chas Crocker, another California millionaire gone to New York; he died several years ago, and his widow less than a year ago, gave to this city the large collection of paintings owned by them, as well as the beautiful gallery in which they are housed, and the grounds pertaining thereto, these being connected by a corridor with the Crocker family residence. This gift was rated, I think, at a valuation of half a million of dollars. The collection of pictures is a very interesting one, "containing many old masters" and some modern ones; but none of them are of special note. There is a series of portraits of noted Californians, railroad and money kings, politicians and historical characters, Thomas Starr King among them, and of the railroad men, the brainiest and shrewdest face is that of C. P. Huntingdon. In one of the rooms where there is the nucleus of a museum, we were much entertained in watching some rattlesnakes in a cage, which had been captured some time previously by a hunter, but in what manner we did not learn. Crackers and bread had been freshly put in for them to feed upon, and one of them held up his tail and rattled most of the time. The sound was very like that which precedes the strike of an alarm clock—or the escape of steam from a valve. The interior finish of the art building is fine, beautiful inlaid floors and carved wood-work, while the grounds are equally charming—enormous orange trees, superb palms and choice trees and shrubs. On certain days no admission fee is charged, while on others a nominal charge of 10 cents is made, and catalogues are loaned to visitors.

The weather was like July in Pennsylvania: strawberries, raspberries, persimmons and pomegranates were in market, and men were going about in their shirt sleeves. We found the best hotel in this city, that we had lodged in since leaving Seattle, and it is famous all over the State for excellence, cleanliness, order, perfect method and moderate charges, and it undoubtedly has more patronage than all the other hotels combined. People who travel much soon learn to appreciate the capabilities of the man or woman who keeps a good inn.

The next morning was misty up to almost half past eleven, our hour for leaving. Anaximander and the laddie went out and explored the Chinese quarter of the city, pronouncing it by far the worst as yet seen. Some kind of religious feast seemed to be going on, and the Mongolians were out in full force in the performance of their own peculiar ceremonials. There were many boats, steamers and barges on the river at this point, and the muddy water was used for drinking purposes. The city is claimed as being less affected with malaria than formally, but still far from being free from that dreadful foe. As we rode on toward Stockton, it was through vineyards and orchards, wind-mills, rows of Lombardy Poplars and vegetable gardens. Occasionally a wire fence was to be seen, but most are of boards. Stockton is a thriving city, and among its striking public buildings, is a State Asylum for the Insane, a class of patients in

which California has, I believe a larger p o-portion than any State in the Union. After passing Lattrop where the train stopped for dinner, we crossed the San Joaquin River and were in what is distinctively the San Joaquin Valley, which is but a continuation of the Sacramento. The two rivers flow into a swampy region south of Sacramento and west of Stockton, and on into San Francisco Bay. These two valleys are partly intersected by this swamp or *tule* land, consisting of 3,000,000 acres. The two valleys are 350 miles long from north to south, with an area of 14,000 square miles, and not over 500 feet above the sea level. The fertility of the soil is said to be far inferior to that of the loamy valleys of the Missouri and Wabash Rivers, and wheat cannot regularly be raised without irrigation. Crossing the San Joaquin Valley the train made its way through a mountanious region *via* Livermore Pass, and ere long we sniffed the fresh air of the coast valleys, and at five o'clock we were in Oakland, the most beautiful city in the United States.

RURAL SPECIAL REPORTS.

Canada.

SOMENOS, Vancouver's Island, Canada, July 9.—The weather for the last ten days has been very wet. Crops look very well. Wheat, oats and peas will be a good average. Roots of all kinds and fruit, as well as hay, good.

J. D.

Dakota.

RAYMOND, Clark Co., July 15.—I have just read your RURAL Special Crop Report. Things have gone from bad to worse since then only a few slight showers the end of May. Wheat put in early and in good shape may produce from one-quarter to one-half crop; late grain will be a total failure. Many are cutting it with the mower for fodder. Hay, extremely scarce, and the prospects, on the whole, very gloomy. Seven-eighths of the flax crop has gone up; oats and barley very light and thin. Hard times inevitable. T. M.

Idaho.

CALDWELL, Ida Co., July 11.—Taking as a standard the Boise Valley, whose soil is as rich as any in the Territory, the condition of all crops is not quite so favorable as at this time last year. Wheat, will fall far short of an average crop, Oats and rye, a fair average. Corn is not raised to any extent, not doing well here; not enough is raised for home consumption—nights are too cool. All kinds of garden truck are in excellent condition. Potatoes a full crop; apples, peaches, pears, plums, and German prunes, very large crops. Grapes are not a success in this section. Hay is the largest yield that has ever been known Alfalfa is raised to a great extent.

J. W. F.

Illinois.

GRANVILLE, Putnam Co., July 16.—Hay a good crop and about made. Wheat (Spring) good. Oats, fair. Corn, a splendid prospect.

J. A.

Minnesota.

LEROY, Mower Co., July 12.—The season has been very dry; no rain from May 10 to amount to anything till July 8, when we had a nice shower, but too late for many crops. Corn is fair—about the same as last year at the same time. Oats are the poorest I have ever seen, lots too short to cut and bind. Wheat is middling; chinch-bugs are operating in lots of pieces. Rye not much raised here; looks fair. Barley is short, and headed out poor; pieces turning out yellow; lots half headed. Potatoes—some look fair. The potato-bugs are multitudinous on account of dry weather. They sat on the fence and brush in the Spring, waiting for the potatoes to come up. Garden truck that has been sprinkled looks fair. Apple trees mostly all killed by a late freeze a year ago last Spring. The few that are left look fair; not many apples. Pears and peaches are not raised here. Berries are fair; not many. Hay is about one-third lighter than last year. From the way things started in the Spring, it looked as though we were going to have early and heavy crops, but dry weather soon made a change. F. A. V.

Montana.

FRIDLEY, Gallatin Co., July 14.—For the last five days the thermometer has been over 100° in the shade, and on the 11th it was 105°, and stood so for three hours. But our nights are cool, so we have the satisfaction of having good sleep. The oat and wheat crops will be below the yield of last year, as the water in streams has been scarce for irrigating. The measured bushel of oats here hardly ever falls below 40 pounds in weight. I don't know what kinds they are, only they are white. The old residents say that the warm spell has never been equaled in this country. Grain, cattle and horses are the main features here—fancy farming has not commenced much. There is hardly any dairying, and I wonder at it, as there is no better place for it in the United States. Butter and cheese bring fancy prices, but dairying, I suppose, takes too much work and is too confining. B. P. V.

Vermont.

CHARLOTTE, Chittenden Co., July 12.—We have been having very fine hay weather, and most of our farmers will finish harvest by the 16th. The hay crop is more than an average.

O. H. A.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

CUTTING DOWN ASPARAGUS; DISINFECTANTS.

T. R. W., Roselle, N. J.—1. Can I cut down asparagus plants any time before maturity of the seeds, without injury to the future growth and bearing of the plants: and if not, why not? 2. What is the best disinfectant and deodorizer for cesspools?

ANS.—1. It is true that fruit-bearing and seed-perfecting are exhaustive processes. It is also true that the roots or tubers of perennial, herbaceous plants need their foliage until it matures, in order to store up the needful amount of strength and food for the future. We should say that it is better to allow the fruit to mature in the case of the asparagus plant rather than to deprive it of its stem and leaves before they *begin* to mature. The best way would be to *cut off the flowers*, not such a difficult task for a small boy. 2. Dry earth, strong loams and clay, reduced to powder, are cheap and excellent. Cover the contents of the cesspool or other fetid substance with the earth. For privy vaults, cesspools, etc., powdered copperas is the best. One or two pounds will destroy the odor from an ordinary cesspool, and it is cheap. It is also the best disinfectant and deodorizer for sinks, drains and other ill-smelling situations. Carbolic acid or chloride of lime can be used in all places where the odor of those deodorizers cannot reach the rooms in the dwelling house.

HOW TO HARVEST AND CURE TOBACCO FOR HOME USE.

F. J. Dundas, Ont., Can.—How should I harvest and cure a small lot of tobacco for home consumption?

ANS.—When the plants shoot up to flower, break off the stalks low enough to take three or four of the upper leaves. Let the plants stand three or four weeks after topping and pick off the suckers that start from the axils of the leaves. Let the plants lie a few hours after cutting to wilt; then hang in a barn or other out-building, on scantling or poles, using coarse twine, wrapping the latter about the stems near the base. After the leaves have all assumed a cinnamon color, take the plants down on a wet day, strip the leaves from the stems and tie them into bundles, keeping the butts all one way. Pack the bundles into a double rank, lapping the tips in the center. Cover the top and ends of the rank with tobacco stalks, leaving the butts exposed to the air, and place a weight of boards or other material on the top. Let the tobacco lie in this condition for some weeks, say until February or March. Then pack the bundles into a box in moist weather, placing the butts outside and the tips in the center, as before. Use a lever and pack into the box very tightly. Nail on the cover securely and keep the box near the ground in a building without a floor until warm weather, then move it to a warm, close loft to go through the sweating process.

ONE AND TWO-YEAR-OLD BERRY PLANTS.

R. V., W. Flambro, Ont., Can.—I bought 100 two-year-old Hansell and 100 Gainor Raspberries from a tree peddler, and when they arrived I refused to pay for them, as I was convinced they were one-year-old; I expect to be sued soon for the price, is there any distinctive difference between one-year-old and two-year-old plants?

ANS.—We are afraid there is no difference between them that would pass as *positive* proof in law. We would advise you to have them examined by a professional grower. He should be able to show that one-year plants have produced but one growth of cane, the canes being biennial. The one-year plants might also show the root cutting from which the plant was grown.

THE MARTIN-AMBER WHEAT.

F. C. A., Austin, Mich.—In our soil the Martin-Amber will outyield the Clawson or Fultz one-third, the Velvet Chaf one-half. It's a good hardy productive variety. It is much like the Armstrong or Landreth in every way and there is little choice between them. For our soil and climate there are few if any better kinds. We should sow one and one-half bushel to the acre—not less unless the land is unusually rich, when a less quantity would do better.

KEROSENE EMULSION.

T. E. C., Norwich, Ont.—We suppose that by "coal-oil" emulsion you mean kerosene emulsion. There are two forms of this—one with milk and the other with soap, but experience has shown the latter is the better; for if properly made and applied, it can be used without injury to plants; while the milk emulsion is reported to be injurious to many kinds of foliage. To make the soap mixture, put a quart of soft soap with a gallon of water into a kettle and heat it to the boiling point, and while still boiling-hot, stir in thoroughly a pint of kerosene oil. Hard soap or whale-oil soap will probably do equally well. The preparation would kill with less soap; but this large proportion of soap makes the mixture more effective, and the miscibility of the oil and soap solution is thereby increased.

THE LUCRETIA DEWBERRY.

R. L., Provincetown, Mass.—The Lucretia Dewberry is a healthy vine and productive. The fruit is large and of fair quality. But really we should not care for it. Unless it is trained to a trellis, the berries lie on the ground and become soiled. Each vine, if not trained to a trellis, covers as much as two standard plants. Now what is the use of planting the Lucretia if we can get standard kinds which are as good in every way without the objections to the Dewberry.

GETTING RID OF RED ANTS.

R. W. D., Dunkirk, N. Y.—Red little ants swarm in millions in my milk-house, and all efforts to get rid of them have been in vain. Can the RURAL suggest an effective way?

ANS.—We have killed ants about bee-hives by putting sirup in which a little Paris-green had been mixed or, better, white arsenic (which is quite soluble), into a small box and covering with wire gause which was coarse enough to admit ants but not bees. This would soon poison all the ants. If we can reach the ant-nest, or ant-hill, we can easily disperse the ants by making a hole in the hill or mound with a crowbar, and turning in kerosene, carbolic acid, or boiling water.

Miscellaneous.

J. P., Kingston, N. J.—There would be little economy in sowing a plot of land already "in good condition," to turnips, for the sake of plowing them under as green manure. If you could grow the turnips and pasture them off with sheep, the land would be benefited; but as a "green manure," turnips would give little improvement. There must be something besides bulk in a green manure.

F. W. L., Trenton Mills, Va.—The Earhart Everbearing Rarpberry bore a full first crop. Up to this time, the buds for a second crop on the canes of this Summer's growth have not yet appeared. The berries were of medium size and quality and borne in close clusters. It can be had of J. H. Hale, South Glastonbury Conn.

W. McD., Joliet, Ill.—The gooseberries sent for name are of a foreign variety. These large foreign kinds generally mildew in this country so that they cannot be raised with profit. We have no native kinds to equal the size, though Houghton and Downing are better in quality.

B. V. H., Fridley, M, T.—The grasses sent for name are Hordeum jubatum, Squirrel-tail Grass—and Ericoma cuspidata—Bunch Grass.

W. J. C., Smethport, Pa.—The grass you inquire about is Festuca pratensis—Meadow Fescue.

DISCUSSION.

G. H., WORCESTER CO., MASS.—D. P. H., page 462, ought to tell us what breed of cows he keeps. I never heard of such cattle before. I am inclined to think that the great majority of farmers, who keep but a few head of stock, do want a "general-purpose" cow. Cattle raising with most of us must be more of a chore than a main business. Can we afford to use all the finer tools for dairying when we keep but two or three cows? I fail to see how. I want a cow that will provide milk and butter for the family, with a little to sell with the eggs, and which will sell when she is eight years old for decent beef. That is all most of us expect of a cow. We don't expect to bury our cows as a mark of respect for the good they have done, but we want them to pay right up to the last.

R. P. MCANALLY, N. C.—With thanks for your news as to oats and wheat turning to chess, we must beg to be excused from again discussing the question. With all respect for the opinions of those who think it possible or even that it often occurs, we cannot ourselves believe that it has ever occurred or ever will.

D. E. H., LEEDS, MASS.—The experience of "E. D. C.," page 467, with the Alaska Pea is a duplicate of my own. The vines are very slender, and have more the appearance of sweet pea vines than anything else. They were planted in good garden soil, well manured with old stable manure.

Miscellaneous Advertising.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 31, 1886.

The next Special Number of the R. N.-Y. will appear in about five weeks.

It may be well again to state that after having tried every way of raising celery, we prefer to dig trenches six inches deep, mix well rotted manure with the bottom soil and set the plants. This seems altogether better than the deeper trenches, as of old, or the new method of surface planting.

In the Rural New-Yorker of Aug. 3, 1884, appeared a portrait of Mr. E. W. Bull, and a sketch of his life. How he originated the Concord Grape was there detailed by our contributor, Ben Perley Poore.

A few weeks ago a dinner and testimonial were given Mr Bull in Boston, Marshall P. Wilder presiding. It was brought about by our respected friend Mr. C. M. Hovey, of that city. The occasion was a memorable one, and many were the kindly words spoken to cheer Mr. Bull in his declining years.

Pres. Wilder writes us: "I have been greatly interested in your experiments in hybridization. I hope you will go on pressing Nature to give us more of the secrets she has stored up in her laboratory for the use of mankind. The time was when I was censured for sustaining Mr. Rogers in his hybridization of the grape as conflicting with the laws which God had ordained for the Government of Nature. But those days have gone by and the field for improvement by cross-fertilization is as boundless as the imagination and enterprise of man."

Yes, buhach will kill the potato grub, or larva of the potato beetle. A teaspoonful of the powder was first wet with alcohol and put in a quart of water. This was blown upon the grubs through a spraying bellows at noon, and the leaves were picked off with the grubs on them and put into a tomato can. The next morning most of the pests were dead and the rest could scarcely move. But this is not an economical insecticide for the potato grub. The same solution was blown upon the tender new shoots of roses, which were infested with green lice. An examination the next day showed that few, if any, were killed.

For the past wet week we have been jumping from one thing to another, attempting much and accomplishing, oh, so little! Everything is neglected; everything behind. We do not like to find fault with our help, but they seem to show so little appreciation of the fact that in periods of bad weather everything should be *driven* during the intervals of sunshine. And then we read letters of our friends, who tell us of droughts in the West, where from causes at the other extreme the work of the farm also suffers. How prone we are to attribute to help the misfortunes that are unavoidable—yes, even the results of our own shortcomings.

We once heard of one farmer who was generally praying for rain. His farm rested upon a plateau in a high mountain range. Another farmer at the foot of the mountain had reason to pray for dry weather. God couldn't very well answer the prayers of both. Probably the "help" were in fault.

Temperance workers have a wide range of operations. From the extreme enthusiast who believes in the total prohibition of the liquor traffic without thought as to how the work is to be accomplished, to the drinking man who tries to avoid liquor in the presence of his children, all have practically the same object in view. All recognize the fact that liquor is a curse. Their different methods of fighting it are due to differences in education and life. Many practical and thoughtful persons believe that the one thing that will accomplish the best work for temperance will be the invention of a new drink. Something is desired that shall present as attractive an appearance as liquor, but supply nutriment and nerve food in the place of stimulation and intoxication. A great majority of drinking business men in the cities drink liquor, not because they court intoxication, but because the overworked system craves stimulants. In several of the larger cities "temperance saloons" have been established where various new drinks are compounded without the use of alcohol in any shape. Beaten eggs mixed with "soda" water or phosphate make the most popular of these new drinks. The objection to many of the lighter drinks is that they cultivate a taste for something stronger. The idea of using them to cure a taste for stronger drinks is surely worthy of thoughtful consideration. We welcome all measures that tend to diminish the quantity of liquor consumed.

The best Jersey cattle in the world are to be found in America. American breeders have, as a rule, bred for butter, disregarding beauty, external appearance or anything else that stood in the way of superior dairy qualities. In England, the Jersey cow has been the subject of too much poetry and romance. She has been considered too much of a pet and a beautiful plaything. As a result, the English Jersey cow is below the Short-horn as a dairy animal. The trying times through which English agriculture is passing, have taught Jersey breeders a useful lesson. The time has come for diminishing the number of pets and increasing the number of useful animals. Jerseys are to be used hereafter to aid in reducing what one writer calls "a national disgrace—a $40,000,000 butter bill." There are thousands of small land-owners who could easily keep a Jersey cow. Such an animal of an approved butter strain could provide milk and butter for a small family on food that would not sustain a cow of one of the larger breeds. The Jersey, thoroughbred and grade, seems well adapted to fill the position of a family cow. There are thousands of them kept on the small farms and "places" near the large cities, where, upon a very limited range, they thrive and supply an abundance of milk and butter. There is a growing market for these family cows, and Jersey breeders would do well to breed particularly for it.

We have been urged to come to the defense of J. H. Reall who was recently in trouble about money that was sent in to help push the oleomargarine bill through Congress. Mr. Reall has made himself very prominent in this legislation. We do not understand who gave him authority to lead in the matter, or who gave him authority to handle moneys donated by dairymen. With these points clear, we might feel more like defending him than we do at present. Mr. Reall has undoubtedly worked hard for honest butter. He deserves the thanks of the people for his labors. No sensible man believes that he worked solely for the benefit of the people. It was a matter of business with him, as it was with all others who made themselves heard in the matter. Mr. Reall's business will probably be increased by the passage of the oleomargarine bill. We hope so at least. We detest hypocrisy. We don't like to see men posing as public benefactors over legislation that is a plain matter of business. Now that the bill has passed Congress, we shall probably be treated to a month's discussion as to who did most to carry it through. Make no mistake on this point. The farmers of the country did it with their petitions and resolutions. The great lesson to be learned is that this country is still ruled from the farm, and that whenever farmers work earnestly and unitedly in support of a just measure they can carry it.

How many of us sometimes heartily sympathize with that pious old Brahmin who dashed to pieces the costly microscope which revealed to him the presence of minute animalcule in the water which he had been accustomed to drink all his life, although his religion forbade him to eat or drink anything possessed of animal life. Here comes Professor Vaughn, of the Michigan University, with the announcement that he has just discovered, by analysis, an irritant poisonous principle called tyrotoxicon in some ice-cream, by which 140 persons were lately poisoned in the Wolverine State. It is believed that this hard word, or rather the poison meant by it, is the result of the decomposition of milk, and may be developed in any milk kept in unclean vessels or in an unwholesome atmosphere. The germ giving rise to it propagates very rapidly, and a small amount will soon infest a large body of milk. It is thought this same principle is largely present in the milk and cream sold to the public, and that its presence may "account for much of the intestinal disturbance in children during warm weather, notably cholera infantum and similar conditions." It is to be hoped that further investigations may furnish house-holders with plain directions for detecting the presence of this irritant poison in milk and cream. We may then acknowledge that our first occasional impulses in such cases are as foolish as that of the pious old Brahmin.

WOOL.

The great London wool sale closed last Saturday. Such sales take place four times a year. Of the 355,000 bales that were offered, 350,000 were sold, leaving a phenomenally small balance to be carried over to the September sales. Of the entire quantity, 150,000 bales were taken for English consumption, and 200,000 bales by outside buyers. The attendance was large throughout, and the bidding spirited. The sales closed at an advance of fully 20 per cent. for Australian Merino, of from 10 to 15 per cent. for cross-bred, and of 25 per cen. for Cape of Good Hope and Natal wools, as compared with prices at the April sales. There was every prospect that prices will be maintained in the near future. Here, it is generally conceded that there has been a reduction of about 10 per cent. in the clip this year, though other estimates make the shortage still greater. The decline has been specially notable in Pennsylvania, Ohio, Michigan, Indiana, Kentucky and Tennessee. In Texas, and especially the Western part of it, the falling off has been still heavier, owing to the terrible drought that has prevailed there the past year, killing thousands of sheep. Indeed it is thought that, owing to the low price of wool everywhere and the consequent slaughter of sheep for the last few years, there is a falling off of the world's clip. The rise in the price of wool here has been a much needed godsend to flock-owners. The spring clip of 1880 was 155,681,751 pounds, and an advance of even three cents a pound on this quantity would amount to $4,670.452,-56. The clip this year, in spite of the recent reduction, is certainly as large as that of six years ago, and the advance has averaged over three cents per pound, so that there is a pretty good sum to be divided between the growers and dealers. All present indications point to a firm or advancing market.

PLAIN TALK ABOUT BLACKBERRIES.

Most of the varieties of blackberries now offered for sale, are abundantly prolific. The first desideratum is therefore quality; the second, size and hardiness. Any blackberry that is not of good quality should be discarded at once, no matter how productive it is, no matter how hardy. We rate size as a second consideration, because a large blackberry without quality is really worthless. The Lawton is perhaps the largest of blackberries, yet the Kittatinny is preferred, though smaller, because it is sweeter. Why should new varieties of blackberries be introduced, that are neither hardier nor better than those already well known! Among the later introductions we have had occasion to speak favorably of the Early Harvest. It is the earliest blackberry ever tested at the Rural Grounds, while the fruit is sweet, tender and of a peculiarly regular form and a jet black color, which give it an attractive appearance. It begins to ripen 10 days before the Kittatinny, and the best of the crop is gathered before the Kittatinny is in full bearing. It is, however, less hardy. We have the Early Cluster. It begins to ripen before the Kittatinny, but its main crop is borne after the latter begins to ripen. Though a bountiful bearer, the berries are comparitively small and of inferior quality. We do not therefore see that there is any legitimate place for the Early Cluster.

The Wilson Junior is also exceedingly productive, ripening somewhat before the Kittatinny without being in any other respect its equal for this particular climate. The Snyder ripens with the Wilson Junior. Its berries are smaller, but the quality is as good; it is fully as productive, while the variety is among the hardiest known. Taylor's Prolific ripens with the Kittatinny and what has been said of the Snyder can be said of this. The new Minnewaska, which will be offered for sale this Fall, does not, so far as we can judge, promise to fill any unoccupied space. The Lucretia Dewberry, after what we consider a fair trial, is not judged to be worthy of introduction. It ripens with the wild dewberries, somewhat after the Early Harvest and before the Wilson Junior. It bears berries enough of goodly size and fair quality. But unless protected by a mulch, the berries are spattered by sand and soil. Besides, it is far more trouble to pick them, while they take possession of three times the space required to raise standards.

IRRIGATION IN CALIFORNIA.

Governor Stoneman, of California, has just called an extra session of the Legislature to deal with the subject of irrigation. The Governor's action has been rendered necessary by a recent decision of the State Supreme Court, which applied the English common law doctrine of riparian rights to the rivers of the State, giving the owners of the property along the streams a monopoly of the water. Such a principle of law causes little hardship in a country like England, where rains are frequent and irrigation unknown; but in rainless regions where, without irrigation, the land would be irreclaimable, it is unjust, incongruous and fatal to all advancement. No English court in England's tropical dependencies would dream of applying it to the arid plains of India, Australia or South Africa. In all such countries custom and law regard all running water, not as the private property of the riparian land owners, but as the collective inheritance of the community at large as indispensable as the air they breathe.

On the Pacific Slope, the conditions of temperature and rainfall are the same as those in India, Australia and South Africa, and for 35 years Californians have been perfecting the most extensive, complex and costly system of irrigation the world has ever seen. By it, arid wastes have been transformed into teeming wheat fields, prolific vineyards and rich gardens. By it the agricultural wealth of the State has been developed to an extent that dwarfs its mineral riches in its flushest days It is this splendid result of labor, energy, enterprise and capital that the Supreme Court has attempted to destroy by the outrageous decision that every foot of water in California is the private property of those who chance to own lands along the rivers, streams and lakes. The decision has raised a storm of anger, protest and indignation all over the State, especially among the busy toilers in various agricultural pursuits, whose interests it threatens with utter ruin. Both political parties and all the fierce factions in each demand immediate legislation to right the monstrous wrong. The decision, on appeal from the lower courts, was reached only by a majority of one, and the terms of four of the judges who sat in the case will expire before the next election, in November. The people having the power to elect wiser judges can have the disastrous decision speedily reversed; while by an efficient amendment to their new Constitution, they should take precautions against any similar insanity in future. The representatives of the people on the judicial bench should be no more permitted to accomplish the ruin of their constituents than the representatives of the people in the Legislature.

BREVITIES.

Rain, rain, rain at the Rural Farm, and much of the wheat still in the field and sprouting.

Whatever others may say of the Diehl-Mediterranean Wheat, there are other kinds we prefer for the Rural Farm.

In the neighborhood of the Rural Farm sweet potatoes are raised every year. The Nansemond is preferred.

"Oakland is the most beautiful city in the United States." So says Mrs. Fisher in her Transcontinental Letter this week.

New Jersey strawberry growers say that their berries about paid for picking and freight. One must do a heavy business to make it profitable at that rate.

Some of our botanical friends may be interested to know that we found a double White Ox-eye Daisy plant. Nearly all the disc flowers were changed to ray flowers.

The commission merchants say: "Blast the raspberries! We can do nothing with them." So it was, in a measure, with strawberries and currants. So it is with gooseberries and will be with blackberries.

Plant some seeds of your best blackberries. Plant in boxes of mellow soil and cover with glass. The plants may be wintered in cold-frames or pits until Spring, and then set in the open ground. Raspberry seeds may also be treated in the same way.

Next to the man who fails to supply fruit for his family during the Summer, we put the man who will not go to dinner when the signal is given. Many good men seem unable to understand that house-work is as much of a business as their own work. They always wait to hoe another row, take another load, or do a little more after dinner is ready. This is all wrong. Nothing is gained by the extra work; the house-wife is often put out of patience, and the dinner may be injured. Stop work when you hear the bell, and go to dinner.

Horseman.

THE HACKNEY HORSE.

THE hackney is the general-purpose roadster in England, either under the saddle or in harness. He usually has a considerable proportion of thoroughbred blood, being often the produce of a mare designed to breed an animal more valuable in the market, but the offspring turning out unsuitable for the purpose intended, the breeder is obliged to sell him as a hackney. The characteristics of a good hackney are as follows: He must be about 15 hands high, compact, and strongly built, with fore and hind parts well muscled. He should be short in the back and well coupled. He should have a deep, wide chest, so that the lungs may have full play. His head should be light and his neck carried well up. His limbs should be clean and bony, with somewhat oblique pasterns. Excellent feet and legs are indispensable to stand the battering on hard roads on which he often travels at the rate of 10 to 12 miles an hour. His movements should be quick and springy. He should be good-tempered and easily controlled, so as to be safe under the saddle or in harness. An excellent specimen of the race is seen, at Fig. 306, in the mare Wild Rose, which has won several prizes at English horse shows; for at all such shows in Great Britain there is a special class for hackneys.

HORSE-BREEDING IN ILLINOIS.

PERHAPS the most conspicuous feature of agricultural development in Illinois at this time is the extension of horse breeding. For 10 years past the horse boom has been mainly confined to the heavy weights; lately the trotters and the thoroughbreds have received a due share of attention, and breeding stables have been established in every large town and every county in two-thirds of the State. These are facts going to show that Kentucky and even California will sooner or later find in Central or Blue-grass Illinois formidable competition both in running and trotting stock, for the State that leads in corn, wheat, grass, hogs, cattle and heavy horses, will not be content until it leads also in fast and fine horses.

Herdsman.

GALLOWAY CATTLE.

THE Galloway breed of cattle are noted for their lack of horns, their round, compact bodies, their short legs and, above all, for their thick, heavy, black, shiny and often curly coats of hair, which give the calves the appearance of Newfoundland dogs of solid color. For these hardy features their friends say of them, that while the Short-horns and White-faces, whenever they are sent west, tend afterward to move south, the Galloways take a contrary direction, and having their overcoats with them, they advance in face of rigorous winter weather, and find in the climates of Idaho and Montana just the bracing air that suits them. In addition to this, if late accounts are to be trusted, the Galloways are likely shortly to appear before the world in a form that will create a surprise and excite a sensation; for it is said that a very successful cross has been made with the buffalo, producing a metis: a cross-bred animal that yields a robe superior in every respect to the buffalo skin.

Those who have seen the Galloways in their best estate, and particularly those who have observed how much the coats of the calves of three or four months old resembles that of a large, well-bred Newfoundland dog, will be ready to accept as truth almost anything that can be claimed for the size, beauty and firmness of the robe of the progeny of the wild buffalo and the tame Galloway. B. F. J.

STOCK JOTTINGS.

IN Bremen, Germany, West Friesland butter sells briskly at 2½ to five pfennigs (between one and two cents each) above the running prices of local butter.

* * *

The *Milk Zeitung*, of Bremen, announces an address book of the breeders of horses, cattle, sheep and pigs. Such a book published here might be of assistance to our live stock breeders.

* * *

The Holland Cattle Herd Book Association, of East Prussia, Germany, held an exhibition of stock at Königsberg, June 3d—6th, at which 330 head were entered to compete for the prizes.

* * *

Last Spring the first cheese factory was established in the Beemster, North Holland, and in June it was working at its full capacity.

* * *

The North Holland Steam Edam Cheese Factory is another new departure in Holland, indicating that the Dutch are following the American plan of cheese factories, instead of each dairyman making his own cheese, according to the immemorial custom.

* * *

A new herd book has appeared in New Zealand recording six different breeds of cattle—among the number appear Holstein-Friesians.

* * *

The Holstein-Friesian bulls Solin and Boyes, owned by Mr. Vincente L. Cazares, carried off prizes at the recent International Agricultural Show at Buenos Ayres, South America.

The Swineherd.

HOG RAISING.

EXPERIMENTALLY, the Magie, or Poland-China, and Berkshire are found to be far in advance of the Suffolk and Chester White, on account of their superior hardiness and quicker maturity for market. Although the Chester Whites have excelled in weight, yet when the age to secure such large hogs is considered, the other breeds are more profitable, being better suited for packers or butchers in 9 to 12 months, averaging 225 pounds or upwards. The rapidity of growth and the cost of feed are very important items in the production of pork. Judicious selection in breeding is unquestionably of the utmost importance in order to secure form and size. In selecting a male, he should be well formed, thoroughbred, and as perfect as possible in all essential qualities belonging to his race. He should have a good supply of food, and be kept in a comfortable, roomy pen, where no hogs will annoy or worry him. His services should not be required more than twice a day.

Sows should be selected not less than nine months old. They should be strong, vigorous and well formed, for it's a sad mistake to select a thin, half-starved animal to obtain good pigs. She must be well fed and kept in good condition. When breeding, she should be kept apart from the drove, and be provided with grass, clover and vegetables, with a little bran and shorts daily, as these foods consist largely of muscle-forming substances. Four months are required for her delivery, and during this important period every preparation should be made by providing a light bed of straw or, better, leaves. If confined in a pen, provision should be made to prevent the loss of pigs by overlaying. The sides should be provided with a board running along each about 10 inches from the floor, jutting out 10 or 12 inches from the side of the pen. Sometimes sows eat their young. In many cases salt pork is found a preventive. [It is much better to feed on succulent or green food, or such as will overcome all tendency to costiveness, which is the great exciting cause.—EDS.] Successful hog-raisers find the business more profitable than any other, and its profits depend largely upon the management, and particularly in checking or preventing diseases, which have created sad havoc within the last few years.

"An ounce of prevention is better than a pound of cure." What are the preventives? A cool, airy place in Summer, and a warm and dry place in Winter, with occasionally small doses of sulphur, and antimony now and then, mixed with the feed. A supply of wood-ashes and charcoal is said to act as a preventive of the cholera. Sometimes lameness or weakness proceeds from the filling up of the "issues," on the inside of the forelegs, just below the knee, which are porous and serve as drains from which all humors of the body, and all superabundant fluids pass off. A cob and soapsuds will prevent this. Feeding on corn exclusively, has proven not only unprofitable, but very unhealthy. The great use of corn is to lay on fat, and it is most beneficial for about four months before the hog goes to the market or slaughter pen. The proper food is, or should be, a good supply of green food, such as grass, clover and vegetables, with slops of bran and shorts, and milk allowed to sour.

Care is of the utmost importance. We may have the best thoroughbreds or pure-blooded stock; we may feed all varieties of food in any style or condition; but without care, or with neglect, our labor of pork making is an entire failure. With favorable circumstances there is nothing that furnishes greater remuneration to the farmer than capital invested in swine.

C. G. BROWN.

Barton Co., Mo.

HACKNEY MARE, WILD ROSE. Re-engraved from the London Live Stock Journal. Fig. 306.

SEVERAL rascals, under the guise of men who have valuable agencies to offer, are flooding the country with blanks—asking a number of impertinent questions of those who receive their missives, with regard to age, occupation, etc., and demanding the names and addresses of "references." This is a favorite game of the sawdust swindlers, and indeed of regular "crooks" of all kinds who go into swindling as a business. The name and other information obtained in this way are quite profitable for use by themselves, or for sale to other sharpers on the outlook for simpletons. Generally a name and address are given—occasionally "high-falutin"—but in two circulars now before us gudgeons are invited to address their letters to a box in the city post office. No one with any just claim to ordinary gumption will confide private matters to a stranger, even in conversation; nobody but a simpleton will do so through the mails.....

We have received several complaints of the very unhandsome conduct of a dealer in seeds at Rochester, N. Y. He is in the habit of sending to perfect strangers whose addresses he has managed to secure, $1.00 packages of assorted flower seeds with a "special offer" permitting the receiver to make a selection at half the price marked on the packets, the rest to be returned by mail. Of course the annoyance is confined almost exclusively to ladies, in the expectation that ignorance of business and timidity predispose them to become dupes of such sharp practices. One lady writes us: "I did not want any of the seeds and did not care to pay postage in order to get rid of the articles. I did not wish, nor had I asked to have them sent to me. This, together with my natural indolence, caused me to do nothing, and the seeds remain on my hands, and now comes a letter saying they are charged to me. I don't care about the charging, but can the fellow collect? Are we to be at the mercy of any knave who may choose to pester us with undesired or possibly undesirable goods?" The seedsman's letter is printed to represent type writing, and is evidently one of a lot struck off to be sent out indiscriminately to all who, like our correspondent, refuse to take the trouble to bother at all with the seeds. It says:

> Some weeks since a small box of flower seeds was mailed you, from which to select such as you might desire, the balance to be returned. No reply has been received from you, nor has the package of seeds been returned, hence your account on my books still stands charged with the box. Kindly give this matter your immediate attention, that I may balance your account. A prompt reply will be truly appreciated.

Enterprise in business is an excellent thing; but in this case isn't enterprise carried to a disreputable extent? Of course, under such circumstances the goods are sent at the sender's risk, and the receiver need not bother at all about them.

A swindling scheme of which the E.-O. has heard several times of late, is the following: A man goes through the rural regions with a lot of salt, or other fine substance, put up in jars, which he calls a stump-consuming powder. His instructions are to bore a hole in the stump, put in the powder, plug up the hole, let it stand for six weeks and then set the stump on fire, and it will burn away down below plow line. The six weeks' provision is a wise one, for it allows the agent to get away. An examination of the powder, however, has proved its worthless qualities, and the farmers who invested in it can't find time to talk about it.

TO SEVERAL INQUIRERS.—We have never received any complaints about the "Perfect Hatcher" of Elmira, N. Y., and we have had several good reports of it. We cannot guarantee any "hatcher," however, as so much depends on the "engineering" of it.....

Various.

SPECIALTIES OF FARMING.

EDWIN TAYLOR.

Two ways of looking at a "terrible example;" widespread tendency towards specialities in agriculture; associated farming; instances; "fool" specialists; specialist John Johnson; advantages of specialization.

ALLUDING to the vagaries of farming, a late RURAL tells how a farmer in Massachusetts allured by the high price of onions one year, planted his entire farm in that crop the next Spring; but, as might have been expected—since one extreme follows another—his onions came in on a glutted market. Potatoes, however, this time were good property, so he dropped onions and went into potatoes the next year, and, as might have been expected, got left again. The item is an instructive instance of what too often happens; but to my mind it better points out the disasters of changeable farming than the unthrift of special farming. If this man, for example, had only held on either to onions or potatoes, he would have had one good crop out of two, and would have averaged reasonably well. It was the change not the specialty, that ruined him. "Unstable as water, thou shall not excel" was not written of the agriculturist of our time; but it is true of him—particularly if he is a specialist. Can the RURAL point to a specialist farmer who has persistently followed a well-selected specialty through a thorough trial—for five years, say (and there are numbers of them)—who now prefers to go back to mixed farming? [How about the cotton planters of the South; or Oliver Dalrymple, the great wheat farmer of the North!—EDS.]

The most noticeable present feature of our American agriculture seems to me to be its tendency toward specialties. It may not be so noticeable in the East as in the West; but in the

East even, what a multiplication there has been in the last 30 years of seed farmers, gardeners, milk-farmers, fancy-stock-men, bee-men, small-fruit-men, tobacco-growers in Connecticut and peach-growers in Delaware! Mixed farming there is itself responding to the prevailing tendency, and is year by year becoming less and less mixed:—that is, the average farmer instead of raising a little of everything, is coming down, more and more, to fewer and fewer things. But in the West "the old order changeth, yielding to the new" more markedly; a rapidly growing proportion of our farmers, are cattle-men, sheep-men, horsemen, wheat-men, fruit-men, etc. The extent and success of their operations, both as individuals and companies, furnish food for much cheerful reflection on the part of that otherwise discouraged "boy," of whom we hear so much, and whom it is so hard to keep on the farm. Since it seems easy enough for farmers to combine when they can get down to a manageable basis to combine on, why should they only fight their battle single-handed? Other forms of the world's work are done by companies or partnership—even to the publishing of the RURAL NEW-YORKER; why should not the producers of its bread and meat likewise avail themselves of the strength of union? Cattle companies are common enough among us. Recently there was chartered the "Kansas City Hog Company," for "the purpose of raising, feeding and selling hogs." The "Olden Orchard Company," of Kansas City, has 20,000 apple and peach trees planted, and aims at 100,000 in the near future. Perhaps that is the kind of farming which will keep the country boy at home? Without the specialty, however, where would the corporation come in? There would be no place for it.

There are specialists and specialists—fool specialists as well as fools who are not specialists. Some who have chosen occupations in harmony with their conditions, have persisted and prospered; others have made unfortunate selections which they have followed up feebly and fickly, and failed. When I came to Kansas, I found a man "going into" small fruits nine miles from a station with no home market, turning up for his mad purpose the very best of pasture seeded down by Nature before his time, and all but marked with the letters, "Reserved for Stock." Of course, he failed; he ought to have been brayed in a mortar. Not long ago, a correspondent was quarreling with his paper because it advised him not to rest his case on strawberries alone, he holding that if the "single idea" was good, the more single the better! Nobody would advocate building a mill on a stream that was dry nine months in the year; but this man, farming in a similarly fitful style (if he really carried out his threat), has no doubt furnished a frequent illustration of the fate in store for specialists. A specialist in farming, as I understand the term, does not limit himself to a single crop, but to what I may call a single line of agriculture; he follows a definite and harmonious programme in his operations—and sticks to it. Farming, like eloquence, cannot be learned from books, helpful as they may be to both; and colloquial speech compares to the flights of the orator as common farming does to the possibilities of achievement within reach of the zealous and studious specialist. There is more in every branch of farming than most people dream of.

I was a boy yet, but old enough to appreciate the "grind" and the narrow outlook of my birth-right—mixed farming—when I read the story of John Johnson, of Geneva, N. Y.—the first agricultural specialist I ever heard of. The story was, briefly, that having a farm adapted to wheat, located favorably for shipping, he raised wheat as his exclusive crop. The fertility of his land he maintained by the manure made from feeding his straw and Western corn to great flocks of wethers bought for the purpose. That was all—wheat and sheep. The more sheep he fed the more manure and the more wheat: and the more wheat he raised, the more sheep he could feed. That was a definite and harmonious programme. It had a beginning and ending. The man who followed it was not distracted by a swarm of side issues, nor frittering away his strength on a multitude of "littles;" and by it he transformed a drudgery into a business! That is how the new revelation looked to me then; and later observations have convinced me that I did not over-draw its advantages.

In no other way, that I know of than by a judicious specialty, can the farmer eliminate from his environment its disadvantages, since every location is particularly suited to some things and unfavorable to others. In no other way that I know of can the farmer hope to become an expert in his calling, or bring to his assistance those great aids to accomplishment—system and routine.

Wyandotte Co., Kans.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

CHIMES.

BY MARION B. ALLEN.

FAR above the fern and moss,
Fluttering birch and wee fir cross,
And the pine's low murmuring,
Where the frightened lichens cling
To the overhanging edge
Of the precipice and ledge,
Fearless in their dainty glee,
Wave the harebells merrily.

From their dusky rafters hung,
Ne'er in Belgian belfry swung
Bells more exquisitely wrought!
By the mountain breezes caught—
Tossing, swaying to and fro—
While beside them bending low,
Breathlessly I wait to hear
Echo of their chiming clear.

But the airy harmony
Is too wonderful for me,
And I cannot catch a strain
Of that rare and sweet refrain.
Yet the tiny bells still ring,
And they shall my greeting bring
Till, though ne'er so softly stirred,
Every trembling note is heard.

—*July Cottage Hearth.*

WOMAN'S WORK.

SECOND PAPER.

IN our last article we spoke about woman's work and the progress it ought to lend to, if we but "let our light shine out," as it seems to be required of us. And in order to do this we must volunteer all our energies and press forward to that goal which we would attain.

Horace Mann said: "In a world so full as this of incitements to exertion and of rewards for achievements, idleness is the most absurd of absurdities and the most shameful of shames. We that do not wish to be classed with the drones in this world should enlist for life's service as one of God's workers."

In the first place, before we try to work for the good of others, we should see that we "practice what we preach," so that the proverb may be proven, "By their works ye shall know them." Next, in preparation for this work we should see that we are making the most of the advantages which nature has given us, and the best way for improving these advantages is by educating and training the mind, so as to prepare ourselves for that work which we are most capable of performing. One might say, what can women do but wash, bake and brew, or else be an ornament to society? They can be all these and more, if they only develop themselves into that stamp of womanhood that the world will be the wiser for their being, and when they shall have passed away, the sweet essence of their blessed works and deeds shall be known through all ages to come.

If a woman studies to enlighten herself, she not only does it for her own soul's good, but for the benefit and good of others.

Suppose that when this country was new, when the red man roamed in the forests of our now productive soil, that no other inhabitants ever ventured to trespass upon that which they claimed their own, what then would be the condition of this Republic? If people from one source and another had not come forward, and tried to enlighten themselves, where would our progressive nation be to-day?

It has been said that "as is the quality of individual culture, so will be the character of the resulting nation." This seems to prove itself true, for since America's sons and daughters have educated themselves and tried to develop that intellect which God has given them, we see it progressing up the steps of time, and by wisdom, industry and valor the republic of the United States has risen to stand against the world. And to avoid a downfall of this prosperous nation like that of Greece and Rome, we should all strive to give it aid, so that it will *ever* continue to rise.

MARY D. THOMAS.

FLOWERS FOR THE TABLE.

Ungathered blossoms lie about everyone; treasures of knowledge, of affection, of beauty and of pleasure are ready for hands that never gather them, and they fade and are gone all unheeded.

These invisible things we are not always wise enough to recognize, but the visible flowers that beautify Spring, Summer and Autumn should not wither unappreciated.

A pleasant fashion, and one that is gaining in favor in even the busiest families, is to have a vase or dish of fresh flowers on the table at each meal.

There is no pleasanter time nor place to bring the first blossoms of each variety and the rare blossoms of individual plants, than the meal-time and the table.

A bright young lady of my acquaintance always asks for an instance to illustrate any such statements as that just made; and following her preference for facts rather than theories. I will give a few "instances."

A large caster occupied the center of a farmer's table, and the mustard bottle, with its wide top, had lost the lid, as mustard bottles in some households seem to have a provoking fashion of doing. It was therefore selected to hold the bouquets for the table, thus making its defect an advantage.

It was usually filled with small flowers and delicate leaves, such as Gilia tricolor, Lily-of-the-Valley, Whitlavia, Sweet Pea, the smaller buds of roses, Maiden-hair fern and Sweet-Brier leaves. Large flowers were always avoided, as having a tendency to give the caster a one-sided appearance.

In another family an old pitcher, handed down through three generations, and having a beauty of its own as well as antiquity to recommend it, was used to hold the flowers for the table. The pitcher was a small one, but large enough to hold the masses of roses, geraniums, chrysanthemums and ferns, and did its duty well.

A low glass dish is always used in another family, and pansies, daisies, for-get-me-nots, double balsams and the fragrant white clematis, known as Virgin's Bower, make the dish beautiful and fragrant day after day.

In a country home where the children all love wild flowers they vie with each other in bringing the rarest specimens of each variety found in woods and fields.

At a pleasant little tea given to a few friends by two sisters who are gifted with artistic talent and skill, the center of the table was ornamented with a vase of their own modeling in clay, and it contained instead of flowers the long-stemmed feathery spheres that succeed the dandelion blossoms.

Late into the Fall, and sometimes all Winter, evergreen leaves, persistent berries and winter ferns can be found in the woods, and bouquets made of these do not need replenishing oftener than once a week.

If anyone is on the lookout for something pretty for the table, he will find a greater variety than would seem possible if he never looked for beauty among the common wild growths of neglected places.

Adding beauty and pleasure to each day of life makes up the sum of happiness, and means to that end, however simple, should be seized upon gladly by every one. ALICE BROWN.

MIDSUMMER MODES.

AT this season, half-way between Summer and Autumn, it is impossible to find much that is absolutely novel. Fashions are perhaps more firmly set than in the fickle spring-time, but of novelties proper there is absolute dearth. The great importers drop mysterious hints of the wonderful fabrics and beautiful combinations that will dazzle the eyes of womankind in a month's time, but that is all. A study of the prevailing styles in wraps and gowns shows a greater regard for comfort and artistic fitness than formerly prevailed. Especially is this true as regards children's frocks:

If there is any prevailing color, properly speaking, we should give preference to gray. The majority of the traveling wraps show either some variation of this shade, or else a modest check. They are for the most part tight fitting, though some very pretty garments have loose sleeves.

Of summer costumes, washing fabrics take prominent rank, and here we see an infinite variety of style and material. Corded gingham is very handsome material having a plaid of raised cords. A pretty frock of this stuff was a combination of plain navy blue with corded blue and red. The skirt was of plain material, with panel of the corded gingham; bodice of the combination, with demi-vest, collar and cuffs of red velvet.

Very charming are the embroidered sateens. A pretty frock of navy blue sateen had side panel and overdress border of blue and white embroidery, the bodice was cut V-shaped, and filled in with embroidery sleeves of the same. Yoke waists in washing frocks are now almost invariably made with a V-shaped yoke. A very pretty almond-colored sateen, was made with vest and panels of figured goods, the design being a quaint oriental pattern in almond, cream, and brown. White muslin and lace frocks are inexpressibly dainty in appearance. As a rule, the make is simple in the extreme; its style depends entirely on the artistic taste of the maker. A very pretty and simple skirt was of knee-deep Swiss embroidery, with broad tucks above to the waist; sash black, and jacket bodice of all-over embroidery, with a vest of fine tucks.

Another gown of white India lawn had a sash back, side panel of embroidered ruffles, and front drapery hanging in straight side plait caught at one side by a large bow. The round waist was tucked back and front, the front V-shaped, bordered by an embroidered ruffle.

This long straight drapery is very popular in white gowns, but its beauty depends entirely on the grace of its draping. A charming gown of écru Egyptian lace hung in charming folds, which were gathered on one side, into a jabot, mingled with ribbon bows.

Washing frocks for little girls are made for the most part peasant fashion, and very picturesque they look. For older girls, a jacket bodice with loose vest is very becoming, worn over a round embroidered skirt, or full front drapery and sash back.

White flannel is a very popular material during the Summer, both for children and adults. We see some very simple gowns of this material, and some very elaborate ones. This white flannel makes up very smartly with white Yak lace. Woolen lace is much finer now than when it first came into vogue, and it often produces really charming effects. A pretty costume was of fine brown étamine, with the entire skirt of wool lace, mingled light and dark brown. The idea of draping heavy stuff over lace is a novel one. The familiar nuns' veiling is again coming to the fore in a variety of novel forms. It may be had woven in lace stripes, or beautifully embroidered in colors.

Coming novelties cast their shadows before, and the knowledge is borne upon us that stripes will soon be the order of the day, with bayadere stripes taking the lead. Panels, and even entire skirts, will be of graduated bayadere stripes, the latter having some suggestions of the aboriginal blanket. It seems as if nearly every dress-stuff now in vogue was some form of étamine. Not the primeval wire-netting like fabric which first went by that name, but every sort of variation from it. There is embroidered étamine, lace-striped étamine, brocaded étamine, and so on, *ad infinitum*. The embroideries and brocades all strive after oriental effects; some of them are beautiful in the extreme. Some of the étamine is woven with an oriental border in graduated stripes.

An almost indescribable fabric was shown as cactus cloth. It was woven in broad stripes of green and red, the entire surface being covered with little hairs, like the bristles of a cactus, green over the red stripes, and white over the green.

Argentine is simply old-fashioned barége revived in bayadere stripes, like our grandmothers' gowns; mozambique is another revival of striped gauzy stuff, and we are likely to see the resurrection of a good many old favorites during the coming season.

For information received thanks are due James McCreery & Co., New York.

GOLDEN GRAINS.

THE heart that is full of love to God can not be full of hatred to men. An atmosphere of perfect love drives out hate, as light drives darkness from the room.... ....

A HOLY life is made up of a number of small things—little words, not eloquent speeches or sermons; little deeds, not miracles or battles, nor one great, heroic act of mighty martyrdom, make up the true Christian life..

THE avoidance of little sins, little inconsistencies, little weaknesses, little follies, indiscretions, and imprudences, little foibles, little indulgences of the flesh—the avoidance of such little things as these goes far to make up, at least the negative beauty of a holy life.....

JUDGE no one by his relations, whatever criticisms you pass upon his companions. Relations like features, are thrust upon us; companions, like clothes, are more or less our own selection..... ....

NEVER fail to say kind and encouraging words to those whom you meet in distress. Your kindness may lift them out of their despair..... .....

ANYTHING which makes religion its second object makes religion no object. God will put up with a great many things in the human heart, but there is one thing He will not put up with in it—a second place. He who offers God a second place offers him *no* place.—*Ruskin*..... .....

R. J. BURDETTE thus hits off Philadelphia; It was one of the pastor's best sermons, and he was describing Heaven. "It was a place of marvelous, matchless, transcendent beauty," he said. "All the mansions were of red brick, with solid white shutters four inches thick, no cornice, brass door-knobs and white marble steps, with angels continually scrubbing them through the countless ages of eternity." "Eloquent preacher," said the stranger in the deacon's pew, at the close of the service. "Philadelphia man, ain't he?" "Ah," said the deacon, "somebody told you."....

THE CHURCH PRESS SAYS: There are journeyings that only increase restlessness. But they who journey in the faith of duty rest in the home of love. They who go upon God's errands are refreshed by His rewards of peace.

MANY of our failures and miseries in Christ-

ian living creep in between the clear hearing of God's command and the doing of it, or even the resolute, determined, hearty *attempting* to do it.....

THE Sunday-school statistics of the Methodist Episcopal Church are now in and footed up for 1885, with the following results: Schools, 22,490; officers and teachers, 246,054; scholars, 1,818,032. This is an increase of 314 schools, 8,582 officers and teachers, and 57,596 scholars..... .....

THE conflicting elements in the Diocese of Pennsylvania have been harmonized in the election of Bishop Whitaker, of Nevada, as Assistant Bishop. If he accepts, it will be a favorable change ....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

MUTTON AND LAMB.

"A joint of mutton, and any pretty little tiny kickshaws, tell William cook."

The best mutton is firm and juicy, of a rather dark red color, and with a great deal of hard, white fat. The leg, though higher in price than any other cut, has a much smaller proportion of bone, and is, therefore, most economical. The loin includes six ribs, the meat being lighter and more delicate than that of the leg. The flank, which is attached to the loin, should be removed for roasting, as it dries up, while, if added to the soup kettle, it will be of some service. A "saddle" of mutton, which is a favorite Virginia roast, is simply the two loins joined. Chops are cut from the loin—called "long" when the flank is left on, and "short" when it is removed. Occasionally the bone is taken from the long chops, and they are sold rolled up, but let no one be persuaded by their attractive appearance to buy them, as they are tough and stringy and dear at any price. The fore-quarter includes both shoulder and breast; the blade dreaded by all carvers can be taken out with a small French boning knife, and the shoulder, stuffed and sewed or skewered in shape, makes a good and cheap roast. The breast is better cut into rib chops, or made into stews.

The above is for the benefit of those young house-keepers who may need some practical directions that will enable them to choose cuts of mutton discreetly.

A fore-quarter of lamb or mutton may be economically and tastefully prepared as follows: Have your butcher divide the shoulder and breast; from the latter, if your family is small, you may cut chops enough for a breakfast, and still have enough left for a stew for dinner. This latter can be made in several very nice ways, one of which is to cut the meat into small pieces; put a little dripping in a frying-pan, and when very hot put in the meat and a sliced onion, fry until turning rather brown, dredge on a tablespoonful of flour, and pepper and salt, enough hot water to cover the meat, and some sliced young carrots, and stew slowly for two hours. If your stew is made from lamb, a pint of shelled green peas may be added half an hour before it is to be done; if of mutton a quart of sliced potatoes.

The shoulder may be baked. Let the butcher take out the bone from the fore-leg; this will make a sort of pocket which you will fill with a dressing made by soaking some stale bread in tepid water; squeeze dry; fry a minced onion in a piece of butter, stir in the bread some chopped parsley, pepper and salt, and enough stewed tomatoes to moisten it sufficiently. Put the meat, after it has been stuffed and skewered into shape, in a baking pan, dash a little hot water over it, and bake covered with an inverted pan. About half an hour before the meat is done remove the upper pan, in order to allow the meat to brown, and baste frequently. This can be served with a tomato sauce, or with the gravy in the pan. The next morning take the gravy and bones and such bits of meat as may be left, together with any trimmings of meat or poultry, cooked or uncooked, that may be in the house, cover with cold water and simmer for two hours. Strain, put the broth over the fire and add a cupful of stewed and strained tomatoes, if you desire a tomato soup. The addition of a cupful of cooked green peas gives a delightful soup also.

An epigramme of lamb is an inexpensive and exceedingly good dish. Put an uncut breast of lamb, weighing about three pounds, over the fire in just enough boiling water to cover it; as soon as it boils up once draw the pot to the side of the fire, skim it, add one level teaspoonful of salt, an onion stuck with six cloves and the usual bunch of soup greens, and simmer gently until the small breast bones will pull out easily. Take it from the pot, pull out all the bones, lay it on a flat platter, set another on it, and press it down with heavy weights until the lamb is cold; next cut it in triangular pieces, roll well in cracker dust, shaking off all that will fall, dip into egg beaten with two tablespoonfuls of cold water, roll again in the cracker dust, and then fry in smoking hot fat. When the pieces are of a bright yellow color, lay them for one minute on a piece of brown paper, to absorb the fat, and then lay them evenly upon a dish of spinach, prepared as follows—wash and trim the spinach and boil in plenty of salted boiling water until it is tender, which will be in from five to seven minutes, according to its age. The water must be boiling fast when the spinach goes in. Drain and let cold water run over it, which keeps it green. Chop very fine and heat smoking-hot in a sauce-pan, with a tablespoonful of butter and two of gravy. The seasoning is pepper, salt and a little grated nutmeg or mace. I have eaten spinach at the best hotels of Washington, New York and San Francisco, and in no case did it equal the above, which is the way it was prepared at the New York Cooking School.

PALMETTO.

SUGGESTIONS,

Do not throw away your old ribbons because they are soiled. Wash them in a solution of fine toilet soap and cold water. Rub no soap on them, but squeeze them lightly through the suds. Place between two cloths and iron with a moderately hot flat-iron.

Pretty little wraps for the baby carriage are made from two pieces of flannel of contrasting colors (blue and white, for instance,) pink the edges of both, and on the one that is intended for the upper side, put a pretty design in outline stitch. Catch the two pieces together with a row of feather stitching about two inches from the edge. Put a bow of satin ribbon in one corner.

Wedding cake is now sent in little satin bags instead of paper boxes. Make them of pink, blue or white, and draw them together with a bit of narrow ribbon like the old-fashioned work bags. Decorate with the monogram or initials of the bride and groom, and wrap the cake in the kind of paper that confectioners use about fresh candies.

An inexpensive scrap receiver is made from a peach basket. Stain it in oak or leave it its natural color and coat with brown varnish. Pink the edges of strips of felt of contrasting colors, and interlace them through the slats; finish top and bottom with a full ruching. Ribbon can be used, but it is too costly, and the felt is very pretty.

I saw a large easy-chair decorated in a very effective way. It was the one bit of bright color in a room furnished in neutral tints, and was very striking. A large rose-colored silk handkerchief of soft Chinese silk, was drawn by one corner through an opening in the carving at the top of the chair, and the rest spread carelessly over the back. These handkerchiefs are very inexpensive here in San Francisco.

MRS. WORTH.

SOFA PILLOW.

Ladies who have not much time to waste on fancy-work will like this, which can be made in a few hours. Make and stuff the pillow and cover it with silesia or some durable stout material, but not ticking. Get one of the large Chinese silk handkerchiefs, which can be found at gentlemen's furnishing stores, and are inexpensive. The color must depend upon your own taste or the shade in which your room is furnished. Put the handkerchief smoothly over the pillow, and turn back toward the center the four corners. Fasten them with invisible stitches, and cover the exposed corners with black velvet or some contrasting colors. Put a ribbon bow on one corner, and finish with a silk cord. Line the under side with Canton flannel. The one I saw was made of gray silk, the corners were of deep cardinal, and on each corner of the handkerchief that was turned over was appliquéd one of the bright bits of silk embroidery that can be bought for a few cents each.

SUSIE.

HAYING AND HARVEST NOTES.

The scorching heat of July has come, and the hardest labor of the whole year must now be performed, getting in the hay and securing the crops of grain. To do this when the thermometer stands at 90° to 110°, is a serious matter. Now the farmer's wife, who understands something of sanitary matters, will look well after the comfort of the over-heated workmen. Tea for dinner, as well as at other times of the day (unless coffee is preferred), is more wholesome than so much cold water, as it is the failing of haymakers to drink too much of it. The meals are a matter of much thought and calculation, as nothing keeps up the health and spirits now like good, wholesome food. Let those who have never been obliged to labor during such oppressive weather, moralize on the sin and folly of making pies. If they knew the comfort these bring to the soul of the housekeeper as well as to the members of the family who gather around the dinner-table and partake of good pie-plant, cherry, raspberry and other pies, they would know that experience sheds light on everything, even on house-work.

A variety of vegetables is desirable, and may be easily secured if proper forethought is used in making the garden. Beet greens when the young beets have attained a little size, are universally relished, and at every one's command. Green peas and new potatoes may form a part of the dinner next day; and the Golden Wax Beans already in blossom, promise another change soon, while the rows of onions are ready to yield their share to the comfort of the family.

The tasselling sweet corn is refreshing to look forward to, for the coming days of harvest. An occasional dish of baked beans gives variety to it all. Fowls in every style of cookery should appear now and then, and what real farmer has not always a surplus of them for table. Eggs dropped in boiling-hot water, or seasoned and baked on a plate, are a nice addition to the supper table, unless the workmen tire of them, as they often do.

Then by taking proper precautions against sunstroke, and care in the use of the machinery used to help the work along, the farmer may hope to safely tide over the weary season until Autumn brings more endurable weather.

AUNT RACHAEL.

FLIES.

I am not a monomaniac on the subject of flies. I could with calmness face the fact that a fly might be roaming quite unmolested upstairs, and even the knowledge that a half dozen were in every room would fail to drive me so near the borders of distraction as it would some people. Nevertheless, I thoroughly detest the whole race, and do like to have them *comfortably scarce* in my house. Last year they were not, and there seemed no good reason why, either. With wire screens all over the house even to the cellar, and springs on the doors beside, it was rather strange that flies should be so numerous; but the screens seemed to keep them in rather than out. I murdered them in cold blood, and drove them till completely exhausted. Of all methods of getting rid of flies driving is the most profitless. Tis a weariness of body and vexation of spirit, and they won't all be driven anyway. For real soul-harrowing pertinacity there is nothing equal in this respect to the November fly. It hugs the chimneys and clings to the warm corners, and if driven from these, only sails tranquilly away to others—anywhere except where it is wanted to go. Fly-driving is a delusion and a snare, and traps don't seem much more successful.

As for insect powder, I would almost prefer flies to shutting out all the blessed air of Heaven and covering furniture and everything with mustard, or what looks like it. I am now a firm believer in old-fashioned fly-paper. I read somewhere this season that if every drop of liquid can be kept away from flies in any room they will all disappear in 48 hours. Of course, I could not keep all water away from those in my kitchen where the pump is; but in the other rooms I was careful to do so, and then by keeping a plate of fly-paper, covered with a little sweetened water, in each room, the truth of the statement was soon proved. In two days scarcely a fly was to be seen. Of course, just at first it was annoying to find dead flies around, but it was better than so many living ones, and after nearly all had been killed, that objection was slight. I keep the paper constantly prepared to beguile any stray wanderers that may come in, and hereafter—whatever others may do—give me fly-paper or give me—well—*give me fly paper anyway!*

RENA ROSS.

SHORT-CAKES, ETC.

I hope I am not too late to benefit some one by the following recipes for short-cakes, made with other fruits than strawberries. For all short-cakes I make a dough as for tea biscuits, only containing rather more flour; roll it into very thin, round cakes large enough to cover the bottom of a large pie plate; put on a layer, then flour that or rub it with melted butter; then put on another. Bake in a quick oven. When done, pull the layers apart, butter well and add the fruit. If you use huckleberries, stew them in a porcelain kettle while your short-cake is baking, adding a quart of well-washed berries, no water, but the juice of one-half of a lemon and a small pinch of ground cinnamon; stew a few moments; add sugar to taste, and put them between and over the cakes. Peaches, pared, sliced and sugared, are delicious to use. Let them stand a while in the sugar; then put them between and on top of the buttered cakes, and to the juice add cream or condensed milk and more sugar; stir well together, and pour over all. Blackberries stewed are also good to use. My Garden Treasures are coming on finely. The sweet peas are commencing to bloom, and are so lovely. Two nasturtiums grace a small rock-work I have made this season; one is a brilliant yellow; the other a deep, rich, velvety, reddish brown; both have been covered with blossoms for weeks. Poppies, coreopsis, zinnias, etc., are all coming on well. My pansies continue as beautiful as ever, and we all revel in their beauties. I never before tried to raise pansies from seed; but shall do so again, as I have succeeded beyond my expectations with them.

AUNT EM.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by all Druggists and Perfumers.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

FARMERS,

Send for Circulars and Price List of The BARNES PAT. IRON FENCE, the cheapest and most durable fence in the world. Address
THE BARNES PAT. IRON FENCE CO., EASTON, PA.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.
E. E. BREWSTER, Holly, Mich.

REMINGTON

News of the Week.

HOME NEWS.

SATURDAY, July 24, 1886.

OUT of the 5,000 Canadian volunteers who participated in the suppression of the Northwest Rebellion, only 900 have accepted land warrants entitling them to 320 acres in the territory. Of the force, 3,500 have chosen scrip instead; 1,000 have made no selection, and according to the terms of the Bounty Act, can't do so after July 31 .....The famishing residents of Western Texas are streaming eastward in flight from the drought, abandoning homes and herds to avoid starvatiou..... The Indiana Soldiers' Orphan Home, at Kingston, was burned Wednesday afternoon—loss, $90,000; insurance, $25,000; usual number of inmates, 300; present, 167; rest off on vacation. .....Wednesday, Mgr. Taschereau was installed at Quebec as a Cardinal of the Catholic Church, with very imposing ceremonies—the first Canadian Cardinal.....Jay Gould has just watered Iron Mountain Railroad stock $3,000,000, and a short time ago he watered the Missouri Pacific $6,000,000—$9,000,000 of "water" on two roads in one year. The "dear public" will be expected to pay solid interest on all that liquid addition. The poor railroad men will also point to the low rate of interest on the railroad stock as proof positive that railroad stock doesn't pay .....Advices from Newfoundland say terrible distress still continues. Thousands are idle and petitioning the Government for work..... The $300,000 received by the Cherokees for grazing privileges, is being distributed among the full-blooded Cherokees—18,319—and the amount due each is $15.95. The negroes and other adopted citizens whose claims have been ignored, will appeal to the courts .....During the last week in June, there were mailed at 20 of the leading post offices in the country 9,567,649 letters; 26,404 sealed packages; 1,146,952 unsealed; and 2,493,780 circulars—total, 13,324,845. This is an increase of 21.7 per cent. in letters; 59.3 per cent. in the number of sealed parcels; 40.6 per cent. in that of unsealed parcels; and 3.1 per cent. in circulars—total, 19.1 per cent. This increase of mail matter and consequent revenue is attributed to the cheaper postage rates..... .....It is proposed to extend the Homestead Laws to Alaska.....More legislation of a retaliatory nature against Canada is being pushed forward in Congress.....Judge Thayer, Democrat, at Youngstown, Ohio, Monday, refused to grant the petition of the Liquor Dealers' Association for an injunction to prevent the County Treasurer from collecting the Dow tax or attaching the penalty. Of 208 saloon-keepers in Mahoney Co., only 10 had paid the tax, but on Tuesday there was a rush to the Treasurer's office, as it was the last day of grace before the adding of the penalty.....The three convicted Milwaukee Raw Reds who conspired to burn the Court House and incite the people to violence, have been sentenced to nine months' imprisonment each. Had their friends not threatened judge, jury and witnesses, the sentence would have been lighter.....There is a great deal of hubbub yet about the Morrison resolution as to the disposal of the Treasury surplus. The opponents of the measure say that it repudiates the public debt in so far as it provides for the payment of a part of it in silver or greenbacks while the understanding has been that it is to be paid in gold. There wont be gold surplus enough to pay at the rate provided. The supporters of the resolution say payments will be made by drafts on the Treasury; these will be deposited in bank like an ordinary draft, and collected in the same way by the bank. In any case the proposition, they say, is to take the spare money in the Treasury and use it in paying a part of the public debt, instead of letting it be idle and continuing to pay interest on that part of the debt..... A. K. Cutting, an American editor, has been for some time confined in a loathsome prison at El Paso, Mexico, for the publication of an article reflecting on a Mexican. The American Consul, Judge Brigham, demanded his release and was ridiculed; last Wednesday the Consul received a despatch from Sec. Bayard to demand his immediate and unconditional release.....That Mexican revolution has not been suppresed yet; but it amounts to little.....Wednesday the House voted, 145 to 36, to adjourn next Wednesday, July 28. The Senate must concur before adjournment takes place, and members protest they will not hurry the consideration of bills delayed too long in the House.....Vermont Prohibitionists nominated a straight ticket last Wednesday.....The National Potters' Association of the United States joined the Knights of Labor Wednesday.....No rain in Colorado for three months; rivers are drying up, crops and stock, as well as families, are sufferiug for water. The High Line Ditch Company has been taking the little water in the Platte River above Denver, causing great suffering to the ranchmen lower down. The Governor, however, has ordered the supply for irrigating purposes to be shut off till the domestic wants of farmers down the river are satisfied.....The week has been remarkable for very destructive hail storms in various parts of the country..... The Canadian authorities are still vigorously euforcing their views of the fishery laws. The captured fishermen have been released, the United States Consuls in some cases paying the $400 fine imposed on each, and the owners in other cases, all parties reserving the right to contest the matter in the courts, or to recover the amount from the Imperial Government.....Manitoba has extended municipal suffrage to its women. Within two years four Provinces of Canada—Ontario, Nova Scotia, New Brunswick and Manitoba—have quietly given a vote to "the best part of creation." The Provinces of Quebec, British Columbia and Prince Edward Island are likely soon to follow..... .....Troops are after Geronimo yet in the Sierra Madre—a long way after him. Reports of negotiations for his surrender denied. .....Canada is now pushing for a Pacific cable from Victoria, B. C., to Japan and Australia, by the way either of Sitka or Honolulu, and to be operated in connection with the Canadian Pacific. Sandford Fleming has gone to England to interest the Imperial Government and Australia.....The Lake Shore Road, unable to transact full business with the strikes on its hands, and bleeding heavily for pay of Pinkertou guards, without whom "scab" workmen won't work, are seeking a way to a graceful back-down in their struggle with the striking switchmen..... .....The Grant Monument Fund amounts now only to $122,472.92. The committee in charge of it expect Congress to appropriate $250,000 towards the $500,000 needed, and it is hoped that after this has been done, the public will respond more liberally.....A glorious time at Albany, N. Y., during the week. Grand celebration of the bi-centennary of the city. President Cleveland and Gov. Hill joined in the festivities Thursday. Greatest jolification the place has ever had. Multitudes of visitors from the adjacent country, and lots from a distance. Fireworks, parades great jubilation generally.....The St. Louis Grand Jury has found indictments against five members of the House of Deligates (Board of Aldermen) for drunkenness, and against three others for levying blacknail.... ....The Chicago aldermen have done nothing specially disgraceful during the past week.... ....The New York 14 indicted aldermen have not yet been tried, as the District Attorney is waiting Jaehne's appeal to the Courts. He is also trying to secure more evidence from some of the aldermen or the boodle-distributor Malony, on promise of immunity..... .....Master Workman Powderly says he would not accept the nomination for Governor of Pa., were it to come to him unanimously, and were he certain of election; nor would he go to Congress, for if there he would like to do his duty as a Congressman, but he couldn't do that now, "as the time of a Congressman is nowadays devoted to place-hunting."..... .....The new extradition treaty with Great Britain is now under consideration by the Senate Committee on Foreign Affair, and will doubtless be confirmed by the Senate. By it only four crimes are mentioned in addition to those for which criminals have all along been extradited under the treaty of 1842. These are: "1. Manslaughter. 2. Burglary. 3. Embezzlement or larceny of the value of $50 or £10 and upwards. 4. Malicious injuries to property, whereby the life of any person shall be endangered. The last clause is aimed especially at dynamiters, and that class of criminals. No clause applies to crimes committed before the treaty comes into force, so that the criminal American mob now in Canada and other parts of the British Empire are safe. Nobody is to be extradited if he can prove that his surrender is sought with a view to punish him for a crime of a political nature. No one surrendered for one crime can be tried for another committed prior to his surrender, until he has had an opportunity to return to the State which has surrendered him. Convicted criminals who have escaped imprisonment are to be surrendered as well as those that are only accused. The record of the conviction and the identification of the person are alone necessary in the former case; but in the latter, sufficient evidence must be given to afford a *prima facie* proof of guilt.. ....Boycotting has been declared a crime in three States—New York, Wisconsin and Connecticut, in each of which boycotters have been sentenced to imprisonment.....The Chicago Anarchists are still on trial. Several of the leaders have betrayed their associates, and made horrible disclosures of intended dynamite massacre of police and the innocent public by these cowardly foreign miscreants.. ....The Central Labor Union of New York City, representing 110,000 workmen, are secretly boycotting the beer made by George Ehret, the wealthiest brewer in the country, because he gave truthful evidence on the late trial of boycotters here, when summoned to do so by a subpœna, and because they think he could have prevented the prosecution and imprisonment of their fellows. Of his customers, 54 have dropped off, as the boycotters won't drink where his beer is sold.... .. The Kansas Prohibitionists take in all the reforms as they go along. Their full State ticket, nominated last week, includes a negro for State Auditor and a woman for Superintendent of Schools..... .....When Senator Miller, of California, died during the last recess of Congress, Democratic Gov. Stoneman appointed George Hearst (millionaire Midas) to fill the vacancy, until the first meeting of the Legislature, which would naturally have occurred on the first of next January. The Governor, however, has called an extra session of the Republican Legislature, and the National and State laws imperatively command the election of a Senator at that session to fill Senator Miller's unexpired term, ending March 4, next. If one is elected he will of course, be a Republican, and "Old George" must go—and that, too, after the passage of the Oleo Bill in spite of his prophecy, vote and efforts. It is thought, however, that as all parties wish the extra session, an agreement has been made to defer the election till January, especially as a Senator can then be elected for the full term of six years, after the assembling of the new Legislature to be chosen in November..... ....The Canadian Government has decided not to recognize any Indian chosen by the Crees to succeed the late Poundmaker as their chief. The intention is to gradually do away with the system adopted by the red men for centuries of selecting as their leader any brave who had especially distinguished himself in war.....

FOREIGN NEWS.

SATURDAY, July 24, 1886.

THE latest returns from the English elections make out the strength of the parties as follows:

Conservatives	319
Gladstone Liberals	192
Liberal-Unionists	74
Nationalists	85
Unionist strength	393
Home-rule strength	277
Unionist majority	116
Conservative lack of a majority	15

Gladstone has resigned; and the Queen has summoned the Marquis of Salisbury to form a Cabinet. Hartington and the other Liberal-Unionist leaders who were urged to join the Conservatives in forming a Ministry, have absolutely refused, so that the Conservatives, though in a minority, must act alone, trusting to the support of the Liberal-Unionists in the general line of their policy. Gladstone is personally to lead a strong, persistent Opposition of the Home-Rulers of all kinds. By his advice, Parnell will not adopt his former obstructive tactics in Parliament, but reserves full power to act as he pleases should the Conservatives attempt coercion.

.....There are ominous mutterings of political disturbances in Ireland. The "no rent" policy is likely to be again adopted. Agrarian outrages are threatened. Catholics are becoming bitterly exasperated against the Orange minority who have done so much to blast their hopes. Parnell and the best of the Nationalist leaders earnestly urge peace and resignation for a while, at any rate; but others are more hot-headed.... .....There has been for some months in London, a grand exhibition of the produce of the British Colonies and India, and vast numbers of people from all parts of the British Empire have been flocking to see it. They have been treated splendidly by the "classes" as well as by the "masses," and Royalty itself has deigned to show them numerous courtesies and marks of favor. Their presence has done much to foster the idea of the "confederation of the Empire." Thursday a special train carrying the "colonial officials" to a grand naval review at Portsmouth was derailed, and several "prominent persons" were seriously injured..... .. In France, that duel (with pistols) between Gen. Boulanger and Baron de Lareinty, both proved brave soldiers, was as harmless as French duels generally are. The Baron missed the General, and the General missed fire, or shot in the air—accounts, of course, differ. It has made Boulanger still more enthusiastically popular among the Republicans. He was a colonel when fighting against the Commune in '71—a rapid rise. The Defence Committee, however, has voted, 14 to 3, not to demolish the Paris city wall, although Boulanger was in the minority.....The French army is considered in prime condition for fighting. The Commander of the French Navy on Wednesday declared that in case of war, he would have no fear in matching the French fleet against that of any nation in the world—even the English..... .....Royalist agitation lively throughout France, and so turbulent at Marseilles that the troops had to disperse the rioters, capturing 200. Anarchists very busy. Louise Michel and several other leaders are again imprisoned awaiting trial for exciting to riot and outrage. Labor very discontented. ..Things quiet in Spain, Castillar, the exiled Republican, has several times lately tried to cause trouble to influence the public funds, so that he could make money enough to push on a revolution. That's his excuse. The Chamber of Deputies has just ratified, 148 to 16, a commercial treaty with England, and the prolongation of existing treaties.....In Italy the cholora returns for yesterday were: Brindisi, 5 new cases, 1 death; Fontana, 3 new cases, 3 deaths; Latiano, 5 new cases, 2 deaths; Ostuni, 2 new cases, 1 death; Codigoro, 2 new cases, no deaths; Massafiscaglia, 6 new cases, 4 deaths; Comacchio, 3 new cases, no deaths. .....In Trieste during the past 24 hours, six new cases of cholera and four deaths from the disease were reported, and in Fiume three new cases and one death..... ....Turkey has at last decided to diminish her army, as danger from Russia has grown less. Of the indemnity imposed on her at the close of the Turko-Russian war she has just paid $250,000. Whenever Russia is "mad" she demands some of that "fine." The surrounding States are discontented but peaceful—compulsorily so. Bulgaria and Eastern Roumelia are being consolidated in spite of Muscovite growls, for the Czar thinks they may form a barrier between him and the Porte some day. Turkey has also "given permission" to increase the Russian fleet in the Black Sea, and the Russian ports there have just been protected by electric apparatus placed in the sea to destroy hostile torpedo boats—the work of American engineers. The closing of the port of Batoum has drawn a "spirited protest" from the English Government, but it is an "accomplished fact" nevertheless. The general impression is that the fear of Germany alone keeps Russia from attacking Turkey..... .....Bismarck and Kalnocky, the Austrian Minister of Foreign Affairs, have had a very friendly meeting, and De Giers, the Russian Minister, is expected to meet the Chancellor soon. The three Emperors—of Germany, Austria and Russia—are to meet next month, and their chief Ministers will then have another meeting. The Emperors do the show business; the Ministers the work. Germany is thriving. Late elections show that the people of Alsace-Loraine are to a considerable extent becoming reconciled to union with the Fatherland. Military preparations for war are incessant. Occasional growls at France show in what direction it is expected.... ....

AGRICULTURAL NEWS.

SATURDAY, July 24, 1886.

AFTER a bitter opposition in the Senate lasting parts of three days, the Oleomargarine Bill passed that body last Tuesday, by a vote of 37 to 24, after the tax on bogus butter had been reduced from five to two cents per pound. As a body, the Democrats opposed and the Republicans favored the bill, the Southern Democrats being especially bitter against it, though none of them exceeded in the bitterness of their attacks Republican Ingalls, of Kansas. He made an outrageous attack on Senator Miller, of New York, and Representative Hatch, of Missouri, Chairmen of the Committee on Agriculture in their respective Houses, both of whom have earnestly and ably pushed the measure through Congress, thus incurring the wrath of the vitriolic Kansan, who fiercely assailed them on the ground that they were working for their own interests because, in sooth, each had a little herd of cows and made butter therefrom. Early in the history of the Republic, it was decided that Congressmen can properly legislate in matters in which they are personally interested along with any large class of citizens. The bill then went to the House for concurrence in the Senate amendment, and after a bitter opposition there on Thursday, it was passed yesterday by a vote of 174 to 75, the Senate amendment having been accepted, as Mr. Hatch feared delay otherwise. On the passage of the bill on June 2, the vote was 177 to 99, so that either the Senate amendment or the pressure of the people added to its strength. The bill is now before the President, who is expected to sign it. It can be passed over his veto in the House, but in the Senate the majority in its favor is 11 votes short of the necessary two-thirds..... .....

Out of 119 hogs being driven to the railroad in Nebraska, the other day, for shipment, 110 died by the way from heat.....Chicago had 200,000 cattle in two days last week. Short pastures are filling the market with un-

ripe stock and ruining prices.....In regard to the supply of hogs for the remainder of the summer season, says the Cincinnati Price Current, much will depend on the weather and its influence upon the corn crop and pasturage. The indications, from extended inquiry throughout the West, appear to be that the supply will equal last year's, but not show any essential gain..... By a recent law the Commissioner of Agriculture is authorized to adopt such measures as he deems best, in co-operation with State authorities, to prevent the spread of contagious pleuro-pneumonia among cattle. Maryland has accepted the plans of the Commissioner, and the work of stamping out the disease commenced Thursday. Three animals were condemned and killed, and post-mortem examinations in each case showed unmistakable evidence of pleuro-pneumonia. Arrangements were made to kill all sick animals found in the State, the Maryland authorities having agreed to condemn all that are found infected. Other States are likely to consent to co-operate with the Department.....The other day E. L. Dwyer caused a startling sensation in Chicago by "purchasing" nearly 1,100,000 bushels of wheat, raising quotations considerably. The lot was thrown on the market in a few days and helped to depress prices. Dwyer, it seems, couldn't put up a margin when asked to do so. It turns out that he had only $50, most of which he spent before asked to "show his hand." He now owes a debt of $35,500 for margins, etc., and has only $2.40 assets to meet it!.....
.....Wednesday night's rain ended the drought but did a great deal of damage to crops in many places. The storm appears to have been severe from the Mississippi to the Atlantic, and the lakes to North Carolina.....
.....The fourth wool series of London sales is to open September 7th, and the fifth and last for the year on November 23.....A rate of 49c per cwt. from St. Louis to New York has been established for compressed wool—one-half the rate for wool in sacks.....
.....The wool crop in the Territorial district about Salt Lake is reported to be 2,000,000 more than last year—the only place reporting an increase. Shrewd Mormons!.....
.....The aggregate receipts of wool at Boston since January 1, 1886, have been 242,289 bales domestic, 59,007 bales foreign, against 263,700 bales domestic and 36,388 bales foreign for the corresponding period of 1885.....The imports of foreign wool at New York from January 1 to July 1 this year show an aggregate of 30,560,239 pounds, valued at $3,373,780, against 16,719,000 pounds, valued at $1,858,044, during the corresponding period of 1885.....
.....During the past year 778,000 frozen sheep arrived in London, while the live sheep penned there amounted to only 603,000..... .... Frederick William Wendenberg, of Bagenz, Prussia, has made application to the Canadian Government for a patent for a process of manufacturing cattle feed from sawdust and also to have patented the use, application, and employment of the same in Canada.....Government taxes the distilling of apple brandy 90 cents a gallon. Sussex and Orange Counties, New Jersey, pay $100,000 a year taxes on their applejack, and a lot more is made illicitly. Some of the "moonshiners" have lately been detected, and stand a good chance of losing some of their illegal profits, as there is a fine of $1,000 or a long imprisonment.....The new meat shops of the Consumers' Company here are doing a tremendous business selling at 20 per cent below other dealers. All three shops are in full blast now. The local butchers are very angry, though they still pretend to pooh-pooh the new enterprise. They have got up a boycott against the new shops, the windows of which have been several times smashed during the nights.

Crops & Markets.

SATURDAY, July 24, 1886.

ACCORDING to the July report of the Department of Agriculture, the full text of which is just received, the area of potatoes is increased slightly; acreage 101.3, as compared with last year. The increment is large in Kansas, Nebraska and Dakota, and much greater than the increase of population in Missouri and California, and some other States and Territories. Condition of potatoes is low, averaging 96.6. It is usually high on the first of July, as the effects of drought, rot or insects always occur later. The excess of rain fall in many districts has interfered with planting, germination and growth. The destiny of the crop is in the future. Should it escape measurably its calamities of the later season, the crop may yet be a good one. The Colorado Beetles are in force from the mountains to the sea.

With regard to pastures, it says in all the Atlantic States and in the Gulf States, as far west as the Mississippi River, the pastures have in general been favored by moist, cool weather, and are in exceptionally good condition. West of the Mississippi, and in the States between the Upper Mississippi and the Ohio, the conditions, as regards rainfall, have been more varied. In Ohio there has been considerable injury from drought in a number of counties, and in a somewhat less degree the same is true of Indiana and Illinois. In Michigan and Wisconsin, complaints of drought are quite numerous, and the damage in a number of counties is serious. There is also considerable complaint on the same score in the States immediately west of the Mississippi, and in Kansas and Nebraska. In most of these States the condition seems to be favorable.

The Agricultural Department issued a supplementary crop report Wednesday. It puts the winter wheat crop at 295,000,000 bushels—just the RURAL'S figure. In the first July report it was said that the condition of spring wheat had declined 15 points since June 1. The Department explains that a loss of 15 points in condition does not mean a loss of 15 per cent. of the crop if last year's crop of 145,000,000 bushels is to be used as the basis for calculation. The fact is that there was last year a similar decline of 10 points, and that the yield of 145,000,000 bushels represented a crop whose condition was only 86. This year's crop was, therefore, on July 1, less than three points lower in condition than the large crop of last year, so that its condition on July 1 indicated a loss of not more than 6,000,000 bushels, as compared with the crop of 1885. But serious injury has been inflicted since July 1. The supplemental report says: "A judicious and reasonable interpretation of the July report of winter and spring wheat would show a prospect for an increase of about 80,000,000 bushels above the official estimate for 1885 (which was 357,000,000). Results of thrashing of winter wheat and the meteorogical conditions of the next two months may easily add 10,000,000 to these figures or subtract quite as large an amount.

The RURAL'S estimate of the increase, in the aggregate crop, was 78,000,000—within 2,000,000 of the Agricultural Department's report three weeks later. We now think, however, that the Department's estimate of the injury done by the Northwestern drought is considerably too low.

A telegram from Danville, Va., Thursday says reports from the tobacco crop in that section are discouraging. Continuous rains have put the crop in bad condition, and no doubt it will be cut short. The indications now point to a small crop and but little bright tobacco.

The Tennessee wheat crop has yielded much better than was anticipated, the crop being better than for many years. Corn is very promising. Much hay was lost on account of wet weather, but the crop was still very large. The oat crop was above the average. Cotton looks well, and the potato crop is good.

It is likely that the cranberry crop also will be very bountiful this year. The Massachusetts meadows are reported to be "in better condition than ever before." The abundant crop and low prices last year had a discouraging effect so that little new bog was prepared in comparison with former years.

The weather has improved in the South Atlantic and Eastern Gulf cotton-growing States. Louisville tobacco crop advices are favorable; the staple held there is firm, and while stocks are large receipts are light. Wheat, after some steadiness, has declined on increased supplies in sight on land and sea, and heavy receipts at primary markets. Corn and oats are relatively stronger. Improved crop prospects for beet sugar and large stocks have caused a further shrinkage in prices of sugar. The total visible supply is 1,252,331 tons, against 1,271,908 tons last week and 1,204,606 tons last year.

The Agricultural Department thus distributes the last crop of wheat:

Estimated consumption: food, 271,000,000 bushels; seed, 51,474,000 bushels; exports (from preliminary statement), 93,596,620 bushels—total, 416,071,520 bushels. Crop of 1885, 357,112,000 bushels; drawn from crop of 1884, 58,959,520 bushels. The "visible supply" has been decreased during the year about 13,000,000 bushels, leaving about 46,000,000 bushels to come from the surplus in the hands of the farmers.

Manufacturers are buying wool with more freedom at seaboard points and at Chicago. Prices are steady and so near the importing point, that an advance may induce imports of foreign. Current quotations for leading sorts are as follows at Boston:

Ohio and Pennsylvania X	32@33c.
Ohio and Pennsylvania XX	33@34c.
Ohio and Pennsylvania XX and above	35c.
Michigan X	32c.
Fine Ohio delaine	35c.
No. 1 combing	36c.
Texas spring, 12 mos	21@24c.
Super A	31@37c.

The sales of the week at Boston are reported at 4,600,000 pounds, as against 4,800,000 pounds last week and 3,700,000 pounds the same week last year.

MARKETS BY TELEGRAPH.

SATURDAY, July 24, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1¼c. lower; No. 2 Spring, 1⅞c. lower. Corn, 2¾c. higher; "futures," about 2c. higher. Oats, 2½c. higher; rise does not affect "futures." Rye, 1½c. higher. Barley, 1½c. higher. Flaxseed, 6½c. higher. Pork, 37½c. lower. Cattle, from 10c. to 25c. higher. Hogs, from 5c. to 20c. higher. Sheep, from 5c. to 25c. higher, except Texans, which are from 15c. to 50c. lower.

WHEAT, weak; Sales ranged: July, 74¾@76¾c; August, 76¾@78¾c; Sept., 78⅛@80¼c; No. 2 Spring, 75¾c. CORN.—Active; cash, 40¼c; July, 39⅝@40⅞c; August, 40¼@41¼c; September, 41⅝@43c. OATS.—Firm; Sales ranged: Cash, 31c; July, 31c; August, 29@29½c; September, 29¾@30⅛c. RYE.—Quiet; No. 2, 53c. BARLEY.—September, 67@68c. FLAXSEED.—No. 1, $1 17½. MESS PORK.—Sales ranged; Cash, $9 52½@9 55; August, $9 52½@9 60; September, $9 60@9 72½. LARD.—Steady; sales ranged: Cash, $6 55@6 57½; August $6 57½@6 62½; September, $6 62@6 67½. Short Ribs.—Cash, at $5 07½. Boxed Meats.—Dry Salted Shoulders, $5 95@6 10; Short Clear sides, at $6 70@6 75. CATTLE.—Market strong; Shipping steers, at $3 30@5 10; stockers and feeders, $2 40@3 90; cows, bulls and mixed $1 80@4 00; bulk, $2 70@3 00; through Texas steers, $2 60@3 87½. HOGS.—Rough and mixed, $4 25@4 70; packing and shipping, $4 70@5 00; light weights $4 30@4 90; skips, $2 70@4 00. SHEEP.—Market steady; Natives, $2 00@4 15, Western, $3 00@3 60; Texans, $2 25@3 25; Lambs, per head, $4 25@5 50.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 2¼c. lower. Corn, 2½c. higher. Oats, 6c. lower; the fall is confined to cash lots; a slight advance in "options." Rye, 1c. lower. Barley, unchanged. Butter, creamery, 2c. to 3c. higher; dairy, 1c. higher for best. Eggs, 1c. lower. Flaxseed, 8c. higher. Pork, 25c. lower. Cattle, a shade higher. Hogs, 10c. to 15c. lower. Sheep, from 25c. to 45c. higher.

WHEAT.—Active; No. 2 Red, Cash, 76½@76⅝c; August, 76¼c; September, 78¼c. CORN.—Active; No. 2 mixed, Cash, 37@37½c; August, 37¾c; September, 39¼c. OATS. Firm; No. 2 mixed, Cash, 28¾@29c.; August, 27½c; September, 29c. RYE, 53c. BARLEY.—No. 3 Spring, 48c. BUTTER.—Creamery, 17@20c; dairy, 10@16c. EGGS, 6c. FLAXSEED.—$1 10. HAY.—Timothy, $10 50; Prairie, $4 50. PORK—$10 25. BULKMEATS.—Long clear, $6 15; short ribs, $6 25; short clear, $6 40. LARD.—$6 25. CATTLE.—Market active; Good to Choice Native Shipping Steers, $4 60@5 00; Common to Fair, $3 85@4 50; Butchers' Steers, $3 50@4 50; Cows and Heifers, $2 25@3 60; Stockers, and Feeders, $3 25@4 35; grass Texans, $2 25@4 00. HOGS.—Market active; Lights, $4 50@4 70; Packing, $4 40@4 75; heavy, $4 80@4 95. SHEEP.—Market firm at $2 25@4 00.

BOSTON.—GRAIN.—Corn.—Steamer yellow at 49½@50½c, and steamer mixed at 48½@49¼c, and no grade at 40@46c. per bushel, as to quality. OATS.—Quiet; No. 2 white, 41@41½c; No. 3 white, 40@40½c; barley, 45c; fancy clipped, 46@46½c. Rye is held at 63c. per bushel. Bran, $14@14 50 for Spring, and $15 50@16 00 for Winter; Fine Feed and Middlings at $14@18, and Cotton Seed Meal $23 on the spot, and $21 75 per ton to arrive. HAY AND STRAW.—Hay is in light demand at $17@18 per ton for choice and fancy, $15 00@16 00 for fair to good, $13 00@16 00 for fine, and $9 00@13 00 for poor and damaged. Western choice, $15@17, do fair to good $14@15. Straw.—Rye straw is held $19 00@19 50 for choice, and $14@18 for common to good. Swale hay at $10 00@11 00. Oat straw, at $10@11 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra, 19½@20c; do. extra firsts, 18@19c; firsts, 16@17c; Western creamery, $17½@19c, for extra firsts to extra; firsts, 15@16c; Northern dairy, 15@17c. for Vermont extra firsts to extra; firsts, 14@14½c; seconds, 13@13c; Western dairy, 12@13c for firsts; seconds, 9@11c; imitation creamery, 11@15c for extra firsts to extra; ladle-packed, 9@12c, for extra firsts to extra; firsts, 8@9c; seconds 7@8c; grease, 3@4c. NEW CHEESE.—New York and Vermont extra, 8@8¼c; do. do. firsts, 7@7½c; do do, seconds, 6@6c; Western extra, 7¾@8c; do. firsts, 6¼@7c. EGGS.—Cape and near-by, per doz. 18c.; Eastern extras 16½@17c; do. firsts, 15½@16c; Northern firsts, 15½@16c; Western firsts, 14½c; Provincial, 15@15½c. BEANS.—Choice Northern hand-picked pea, $1 75@1 80 per bushel; do. do. New York, small, $1 60@1 70; do. do. screened $1 15@1 30; medium choice, hand-picked, $1 45@1 50; do. do. screened, $1 15@1 25; Yellow Eyes, improved $1 50; do. choice flats, $1 25@1 40; Red Kidneys, $1 60@1 70; Canada pea, 65@95c. per bushel for common to choice; green peas, Northern, 90c@$1; do. Western, $1 15@1 20. POTATOES range at $3 00@3 25 per barrel for new. Nothing of consequence doing in old.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 24, 1886.

STATE OF THE MARKET.—As compared with cash prices last week, flour is 10c. lower; No. 2 Chicago wheat, ½c. lower; No. 1 Northern, ½c. lower; corn, No. 2, 1½c. higher; oats, ½c. lower; pork, 12½c. lower; butter and cheese, steady; fruits steady.

FLOUR, FEED AND MEAL—FLOUR—Quotations: Fine, $2 15@2 65; Superfine, $2 25@2 85; Extra No. 2, $2 65@3 15; Good to Fancy Extra State, $3 20@3 85; Common to Good Extra Western, $2 70@3 25; Good to Choice Extra Western, $4 00@5 00; Common to Fair Extra Ohio, $2 65@3 75; Good, $3 80@4 20; Good to Choice, $4 25@4 75; Common Extra Minnesota, $2 65@3 25; Clear, $3 25@3 75; Rye Mixture, $3 30@3 75; Straight, $4 00@4 60; Patent $4 40@5 10; Bakers' Extra, $3 75@4 30; St. Louis Common to Fair Extra, $2 65@3 65; Fair to Good, $3 70@4 50; Good to Very Choice, $4 55@5 00, Patent Winter Wheat Extra, $4 40@5 00; City Mill Extra for West Indies, $4 35@4 40; South America, $4 40@4 50. SOUTHERN FLOUR.—Common to Fair Extra at $3 05@3 75, and Fair to Choice, $3 80@5 10. RYE FLOUR.—Superfine, $3 25@3 65, latter for choice. CORN MEAL.—Yellow Western quoted at $2 50@2 75; and Brandywine at $2 70@2 85. FEED.—40 to 50 lb, quoted at 65@72½c, and from mill at 67½c; 60 lb at 62½@65c; 50 lb at 70@75c; 100 lb at 85@85c; sharps at 95c@$1. Rye nominal.

GRAIN.—WHEAT.—No. 2 Chicago, at 86@86½c; No. 1 Northern, 87c; No. 1 Hard, 90c; Ungraded Red, 81@90½c; No. 3 Red, 85¼c; Steamer, 85c; No. 2 Red, 87@87½c; No. 2 Red, July, 85¼c; do. for August, 85⅞@87 5 16c; do. for September, 86⅝@88¼c; do. for October, 87¾@89⅝c; do. for November, 89½@90½c; do. for December, 90¾@91⅝c; do. for January, 91¾@92½c; do. for May, 96⅛@97⅝c. do. for June, 96⅝@97⅝c. CORN.—Ungraded Mixed, at 42¾@48½c; Ungraded White, 46½c; No. 2 July, 47¾@48½c; do. for August, 47⅝@48½c; do. for September, 48½@49½c; do. for October, 49@50½c. OATS.—No. 2, 36½c; do. White, 39@41c; No. 2, 37¼@37½c; do. White, 41½@43c; Mixed Western, 36@38c; White do. 40@45c; White State, 43c; No. 2 July, 37½c.; do. for August, 34⅝@34½c; do for September, 34⅝@34½c; do. for October, 34½@35c.

PROVISIONS.—PORK.—Mess, $10 37½@10 62½ for Old and $11 25@11 62½ for New; $12 00@12 75 for Family Mess; $14 00@14 75 for Clear Back; and $9 50@10 00 for Extra Prime. BEEF.—Extra India Mess, $12 00@14 00; Extra Mess, in barrels, $8 50; Packet, $8 50; Plate, $8 50. BEEF HAMS.—$21 75. CUT MEATS.—Pickled Shoulders, 6½c; Pickled Hams, 11¾@12c; Pickled Bellies, 6¾@6¾c; City Pickled Shoulders, 6½c; Smoked Shoulders, 7¼c; Pickled Hams, 11¾@12c, Smoked Hams, 12½@13c. MIDDLES.—Long Clear in New York, 7c; at the West, Long Clear, 6.20c; Short Clear, 6.45c. DRESSED HOGS.—City Heavy to Light at 6¼@6¾c; Pigs, 6¾c. LARD.—Western Steam spot, 6.75c; Choice, 6.81c; August, 6.76@6.79c; September, 6.81@6.86c; October, 6.70@6.72c, November, 6.81. City Steam, 6.35c. Refined, quoted nominally, 7c; Continent, 7.10@7.15c.

BUTTER.—Creamery—State and Delaware County, pails, fine, 18¼@19c; State and Pennsylvania, 18@18½c; Western best, 17½@18c; Western prime, 16@16½c.; Western good, 14½@15c. State Dairy.—Half-firkin tubs, best, 15c; do. do, about prime, 14@15c; do. do., good, 13@14c; do. common, 11@12c; Welsh tubs, best, 15c; do. prime, 14c. Western.—Imitation Creamery, best, 13c; do. do. fair and good, 10@12c; Dairy, fine, 12c; do, common, 9@11c; Factory, fresh, 11c; do. good, 9@10c.

CHEESE.—The quotations are for: New State Factory, best white, 8¼@8½c; do. do, best colored, 8½@8¼c; do, do, fine, 7¾@7¾c; do. do, fair, 6⅞@7⅜c; do.do., common, 6¼@6¾c; Ohio factory, fine, 7¼@7¾c; State factory, nightskims, 6@6½c.

EGGS.—Quotations are for: State, 15@15½c; Western, 14½c.; Canadian, 14½c.

POULTRY.—LIVE.—Chickens, spring, per lb, at 11@16c; fowls, near-by lots, per lb, at 11½@12c.; fowls, Western lots, per lb, at 11½@12c.; fowls Southern lots, per lb, at 11½c; turkeys, per lb at 8@9c; ducks, western, per pair, at 50@60c.; geese, western, per pair, at $1.00@1.25.

POULTRY.—DRESSED.—Turkeys, per pound, at 9@10c.; Spring chickens, Philadelphia, per pound at 20@21c.; do. western, per lb, at 14@16c; fowls, Pennsylvania, prime, per lb, 14c.; do State and western, per lb, at 13@14c.

FRUITS.—FRESH.—Quotations are: Apples.—Norfolk, per bbl., at $2 00@3 00; do. Maryland and Delaware, per crate, at 75c@$1. Red Astrachan, per bbl., $2@2 50; Jersey, $2@2 25 per bbl. Cherries, 4@7c. for western prime, and 3@8c. for up river large, and 2c. for small. Gooseberries, per bush., $1@1 50 Huckleberries 6@8c. per quart. Peaches, 75c@1 50 for prime Georgia and South Carolina per crate; $1 50@1 75 for prime North Carolina per bush. crate, and 50c.@$1 for fair and good lots. Plums, 8@4c per quart. Raspberries, 2@3 for up river per cup. 1½@2c. for do. native; 2@3c. for black cap, up river, and 3@5c. for do. Jersey.

FRUITS.—DRIED.—The quotations are as follows: Apples—Fancy evaporated, at 7¾@8c; do. choice, at 7¼c, do. prime at 7@7¼c; fancy North Carolina sliced, at —; choice do. at 2½@3c.; choice Tennessee quarters at 1½@2c.; State quarters at 2½@3c.; southern sliced prime at 1½@2c; do. common, —. Peaches—Peeled North Carolina, choice, 11c; fancy, 12@12½c; extra fancy, —c; Georgia, choice, at 10@11c; do. prime, 8@9c; unpeeled halves, 2¾@3c; unpeeled quarters at 2¼@2½c.; Delaware evaporated, peeled,—@—c; unpeeled do., at —@—c. Choice pitted cherries at 10c. Evaporated raspberries, at —@15c; sun-dried do. 18@—c. Blackberries—Prime at 3¾@4c. Whortleberries at —c. Plums, at 5c; California evaporated, —@—c.

PEANUTS.—The quotations are: 6½c. for best hand-picked; 4@5c. for farmers' grades.

COTTON.—The quotations, according to the American classification, are as follows:

For the Young.

SOME people wonder where the men and boys of the future are going to find work to do. We have so many men out of work now, and so many more who earn only just about enough to keep alive, that some people seem to be afraid the time will come when there will not be work enough to go around. What can be done then? I have found one thing in my life about work, and that is, there is only one place in every trade that is not crowded, and that is at the top. Good workmen are always wanted, and they are very seldom out of work. People with money always want good men that they can trust, and they are ready to pay good wages. The great crowd and rush comes in the classes of work that anybody can do. The poorest pay is given to those who just work with their hands and never think about what they want to do. To make a good workman a boy should begin before he is 10 years old to think about what he has to do. It takes a life-study to make a great man, or to excel in any line of work, and we can't begin this study any too soon. Some good man in every neighborhood is always watching for good, trusty boys. If he sees a boy who can be fully trusted about his work, who is saving and watchful, minds his own business and keeps his wits about him, he always keeps his eye on that boy, and the first you know there is some good position all ready. People are watching you, boys, to see what you amount to. If you stick to business and do the best you can, there will be a good chance for you, but if you neglect your opportunities and do nothing but play, you will never get out of the crowd where work is cheap and hard to get.

A great many boys think they know more than they really do. They are apt to make themselves appear ridiculous. Be careful about that. If you have learned something out of a book, don't be in a great hurry to tell people about it. It is safe enough to conclude that it is no new thing, or it never would have been put in print. Never volunteer information to older persons. That always looks bad, and it makes a poor impression upon strangers. If you are asked for your opinion, give it, and say nothing more. Don't be afraid that people won't understand that you know so much. Knowledge is one of the things that we can't hide. It is sure to be noticed. There will be plenty of time for you to make your mark after you are 30 years old. Boys who shoot up so quickly and appear to "know it all" before they are able to raise a beard, generally end like those plants that shoot up to a great height and then fall over because their stems are not large enough to support them. Don't think you can crowd into your head in a few years what it has cost others a lifetime to learn. It can't be done, boys, and you will be better and wiser men for finding it out. Go slow, take your time about learning things, but remember what you do learn.

Some boys always like to call "cry baby" when they see a girl crying. That is too mean and cowardly for any of my boys to do. Some girls cry too easily, perhaps, but most of them are braver than a boy would be under the same circumstances. The boy or the man who will stand by and laugh at the sight of a girl or woman crying, has no place with me. Girls should do their best to be brave, yet who wants a girl or woman to be as strong or rough as a boy or man? It is a man's business to do the rough and hard part of the work. That is what he was made strong and rugged for. Many women go dragging on through life without any kindness or sympathy. They stand it as long as they can, for years sometimes, and then they just break down. Nobody seems to understand how much they have done and how noble they have been. How about your mothers, boys; do they need help that you can give them? If they do, and you neglect to help them, what can we think of you?

Why should people always want to spend money when they go off for a holiday? I think the practice is a poor one. Most people, when they go to the fair or to a celebration of any kind, feel badly if they can't take along lots of money to spend. If they bought useful things it would be well enough, but half the time they won't do it. They buy cakes and candy, or a dinner not half as good as one they could have brought from home, and very likely make themselves sick for a day or so. I believe it is better to keep your money in your pocket at such places, or, better still, to leave it at home. I can remember the first time I ever went to a fair. I had 50 cents to spend. I bought some peanuts and some candy, not half so good as the candy we made at home. I saw a man selling great pieces of what he called Californuia gold. I bought a piece of it, because he said it was worth at least $5. Then I paid to sit on a horse while a man turned a crank and moved us around in a circle. The motion was not half so pleasant as that in a swing hanging on the limb of an apple tree. Then I saw a man with some little sticks standing up on a table. He said he would give 50 cents to any person who would knock down the sticks by throwing some little balls at them. I tried that, but I never could hit the stieks; the balls always just missed them. When I stopped throwing, I was surprised to find that I owed the man 30 cents, while I had only five cents in my pocket. A man gave me the money on condition that I would work for him when I got home. I think I worked several days before he was satisfied, and I lost my piece of "California gold." Now, do you think I had 50 cents worth of fun out of that? I don't, and I have never spent any more money in that way. If you ever expect to have any property, boys, keep away from all such business as that was.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

IT may be imagined that this announcement did not add to the pleasure of my ride. I wanted to turn back, but it was now too late for that. We rode on in silence for a short time. My companion seemed to feel that he had done his duty by stating so exactly the circumstances of my engagement as teacher. The pleasant Winter I had figured out as "principal" and "teacher of eloeution" had been rudely interrupted.

Suddenly the moderator pulled at the reins of his horses. These fat animals were only too glad to stop. We halted at a cross-road which ran its muddy length through a wide, flat pasture up to a thick grove, where it was lost from view under the trees.

"Ain't passed no examination yit, hev ye?" The moderator fixed his small eyes on me as he asked this question. "Cause ye can't never take up no school till ye kin show yer papers. That's a tied-up rule in Bear Crick deestrict. If ye ain't got no papers ye better git out an' foller that road through them woods, take the fust turn to the right an' the second to the left an' it'll bring ye to the super'tendent's house—he'll examine ye, I'll lay a hoss, so'st yer head'll swim when ye git through. Ef ye pass ye better find yer way over ter Wolf Crick deestrict. Ye kin stop to my house ef ye wanter, but its a standin' rule fer the director ter board the master the fust week fer nothin'. Super'tendent's name's Greening. He's et all the school books they is, an' a couple o' dictionaries, I reckon, an' I expect he'll put ye through a course o' sprouts."

There was something about the moderator's method of making these suggestions that made it impossible for me to argue with him. I got out of the wagon and he at once started his horses again. As I stood in the mud, he called back: "I'll take yer bag down to the director's house seein's I'm goin' by."

There was but one course for me to follow. Turning in the direction indicated, I picked my way as best I could through the mud toward the grove. There was a thin strip of grass at either side of the road, and I managed to make the journey without any serious damage to my boots.

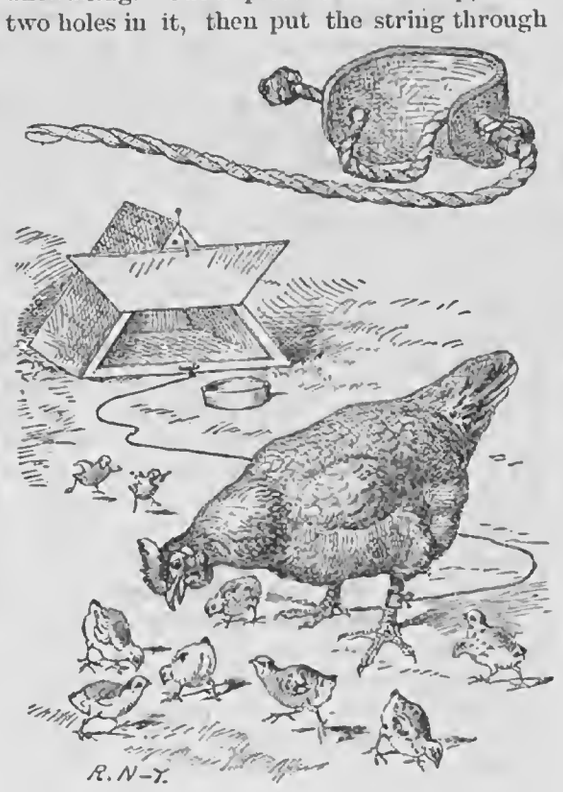
At last I found myself in front of a low, white house, about which the barns and other buildings were clustered so closely that the house seemed in danger of being pushed into the road. At first sight I was unable to detect any human being in sight; at last the upper part of a man started up from the side of a large pig-pen which stood conveniently near the kitchen door. His clothes were so nearly the color of the boards that I had been unable to tell the difference. I remember feeling how ridiculous it was to think of mixing a school officer up with a pig-pen.

"Hog! oh hog! you hog!" the figure shouted in a harsh voice, waving his hand at some occupant of the pen. I picked my way through the mud toward him, trying to convey the idea from my manner that I was not obeying his call. Just as I reached the little strip of grass that served for a yard, the man dropped again over the edge of the pen and called again, this time in a coaxing tone: "Oh hog! you hog! Hog! Hog! Hog!"

The only answer from within was a low grunt of contentment.

NOTES FROM THE COUSINS.

DEAR SIR: I saw the picture of a handy coop in your paper. I made one, but did not like it. I knocked off the slats that the door closed over and make a hopple and fastened it to the coop by a staple. I then took a piece of grape twine about nine feet long, twisted it and then tied a knot to keep it from untwisting. Cut a piece of boot top, made two holes in it, then put the string through



the two holes in the leather, slip it over the hen's foot and tie a knot close to the leather to keep it from slipping off. The whole thing is shown in the picture. Yours truly,

Vineland, N. J. FRED CHALMER.

DEAR UNCLE MARK: I was very much surprised when I received your notice that I had drawn the plow. I have received it from D. Woodward & Son, and it is something entirely new in this part of the country, for the jointer is on the other side of the plow. Everybody thinks it is very nice. We shall try it as soon as the wheat is drawn off the field. My Grandfather is going to make me a nice present for getting it. He is going to take my plow to Rush to try. We are having vacation now. From your niece,

ABBIE WARD.

DEAR UNCLE MARK: I am a little girl 12 years old. I would like to be a member of the Y. H. C. My Papa is a farmer, he takes the RURAL, and I read the letters from the Cousins with much pleasure. We have five cows, three horses and two mules, three calves and 27 hogs. This is the first letter I ever wrote to the RURAL and I don't know whether it will be a good one or not.

Your niece, BERTHA BANTA.

Oquawka, Ill.

DEAR UNCLE MARK: It has been nearly a year since I wrote my first and only letter to you. I have been very busy, but I have read the Cousin's letters, and often thought of you. We have a nursery, and raise small fruit and the hardiest kinds of apples. The severe Winters have killed a great many varieties. We have over 60 varieties of grapes. I like Moore's the best of the black ones, the Brighton of the red, and the Lady of the white. We have some grape cuttings which were set out about May 1, and some of them are 16 inches high. I like all kinds of fruit which I have tasted. Papa has a seedling raspberry. It came up among the grape vines three years ago. It bore last year for the first time. It was as large as the Gregg and more prolific. A tip took root near, and Papa left it. This Summer it is five feet each way and has over 100 fruit stems, and is larger than the Gregg. Papa has picked 2,300 off the old one, and 1,805 off the yearling, and there are a few which are not ripe yet. They looked beautiful before any were picked. We have several other seedling raspberries and quite a number of seedling grapes bearing, also a strawberry. We have about five acres of strawberries. They bore quite well considering the very dry season. I can make 500 or 600 berry boxes in a day. I like to make them. Papa sold his berries in Marshalltown. I went with him nearly every day for quite a while. It is seven miles. Marshalltown is the county seat of Marshall County. It is a city of about 12,000 inhabitants. It is a very pretty place located on the Iowa River. The Soldier's Home is located there. There are some saloons, but a great many of the people are in favor of Prohibition and think our county will be cleared of alcohol and tobacco before many years. There are no saloons in our town. We are temperance people. Mamma belongs to the W. C. T. U. I am a temperance girl, and I hope all the Cousins are. I water my flowers, but they are not as nice as they were last year. I guess that you are old and look young. Is that the way of it?

Your niece, CLARA CRIPPS.

Albion, Iowa.

[I hope you will do all you can to make temperance reign in your county. Every farmer boy and every farmer girl should help in this work, because there is nothing that can make farm life so bad as whisky.—U. M.]

DEAR UNCLE MARK: I fear I have long ago been classed with the "Silent Cousins"—if cousin I may be called—for my negligence. However, I'll try and do better in the future. We have not had a half-inch of rain since the 28th of April, and crops are suffering terribly. Corn is hardly two feet high and it is tasseling. Of the late potatoes we planted, only about one-third came up. Wheat and oats are very poor, about a third of a crop. Hay on an average yields about 200 pounds per acre. A neighbor cut 60 acres, and obtained about five tons. There will not be more than an eighth of a crop of apples, and they will fall from the trees unless we soon have rain. Berries are scarce, owing to the long drought. The Garden Treasures were planted, but not one of them came up, although they were watered. I guess the reason was because the sun beat down so hot that it dried the water away before the seeds derived any benefit from it. Away up here in Michigan the thermometer registered 101° in the shade. The earth has often been so hot that it would nearly blister my feet when I went barefoot. Some of my girl Cousins, in the city especially, may be surprised that a girl of 15 would go barefoot; but I do sometimes, and enjoy it, too. That recalls to my mind one day when a young man who was working on the farm said his shoes hurt his feet. I asked him why he didn't go barefoot for a while, just to rest his feet, and what do you suppose his answer was? "Because I'm afraid it will make my feet larger." I laughed at him, and told him that I had been barefoot a share of every one of the 15 Summers of my life, and his foot was larger than mine. Well, this isn't what I meant to write, but I let my thoughts run away with my senses. I guess I had better go back to my subject. The vegetable garden is quite fine; thanks to the watering Mother and sister give it nearly every night. Fires are all around. Many people have lost about all they have. One gentleman had an orchard of over 1,500 trees and he lost all but 15, and his house and barn. When fire once gets in a meadow it is almost impossible to put it out, the earth being so dry that it runs under the sod. Great damage has also been done to the forest, in fact nearly all of the woods have been burned over, and where the fire runs it not only destroys the trees, but the soil also. Good bye,

"BROWNIE."

[I am glad you are sensible about your feet. I would like to go barefoot myself if I had time. I don't think much of the people who are always afraid their feet will seem large.—U. M.]

DEAR UNCLE MARK: I have a little bird; it sings about all the time. We moved last December to Worcester, and the little bird is over to my Auntie's. He was 14 years old last Summer. I had two birds but one of them died. I have 43 chickens and a cow. Papa is taking care of a farm, he has six cows, nine calves, four pigs and three horses. I go to school. I have no brothers nor sisters. The corn came up and was doing nicely and one of our horses got out and went into the garden and ate the corn and broke it all down. I live at the Military Academy. There are 42 boys in the school. Your niece,

Worcester, Mass. ETTA L. GILBERT.

DEAR UNCLE MARK: Ever since I could read I have been reading the letters from the Cousins. As soon as the papers are brought home I always see what the Cousins and Uncle Mark have to say. Grandpa takes the RURAL and would not do without it. Unlike many of the Cousins I have neither brother nor sister. At present my pets are two canary birds, two pigs and one little dog. Last Summer I raised for myself eight ducks, one goose, and four turkeys. This year I want to get a setting of the Wyandotte eggs. I think I would like them. I am going to try for a prize on the Bird Cantaloupe. Your nephew,

Effingham, Ill. NOBLE MITCHELL.

[I wish everybody could get a prize.—U. M.]

DEAR UNCLE MARK: As I have not written for some time, you have probably taken my name off your list. In my garden last year, I had several kinds of radishes, lettuce, parsley, beans, peas, sweet peas (which were lovely), mignonette and zinnias. Most of my nicest flower seeds didn't come up, which was quite discouraging. I don't know what was the matter with them. Quite a good many of my radishes had a worm in the root. Could you tell me how to prevent it? We have had some very cold weather here. At one time it was 15 below zero. You ask how many think there ought to be a law against the use of tobacco. I think there ought to be, and I wish there was. I also think there ought to be a law against the use of intoxicating drinks. Don't you? It don't do people any good to drink it, but it does them lots of harm.

Duchess Co., N. Y. BESSIE C. UNDERHILL.

[Lime will kill the worms. I am glad you are for temperance.—U. M.]

PERSONALS.

IT is authoritatively announced that the President and his wife will take their only summer outing at an obscure point in the Adirondack wilderness. This may be "authoritatively" contradicted in a day or week, however.

IT is positively stated at Ottawa that Sir John Macdonald will resign the Premiership of Canada on his return from the Northwest, because of poor health, and that either Sir Hector McLean or Sir Alexander Campbell will succeed him.

A DAKOTA man by the name of Rose gave his daughter the name of Wild, that she might be called the Wild Rose of the Prairie; but she ran away with a man by the name of Bull the other day, and her name is a terror to the inhabitants.

NED BUNTLINE (Edward Z. C. Judson) died of heart disease at his home at Stamford, N. Y., last Saturday, in his 64th year. He served with distinction in the army and the navy, and subsequently acquired a fortune in literature, but most of it he spent lavishly.

MISS R. S. MILLS is the heroine of Dakota. She edits the Hawley Star, a weekly newspaper of considerable circulation, planted five acres of trees on a tree claim, built a saw-mill and when she has proved up her homestead will have 480 acres of land in her own name.

A HORSE of Otis Nelson, of Milford, Mass., kicked over a hive of bees, which attacked him furiously. Mr. Nelson went to the rescue, and they pitched into him; then Mrs. Nelson, bare-headed and bare-armed, rushed out and the bees attacked her. So badly was she stung that it was feared she would die from blood-poisoning.

THE late Benjamin Moran, Minister to Portugal, and for a long time Secretary of the United States Legation at London, was a familiar figure in London society. It is said that he kept a diary in which he recorded the dinners to which he had been invited, the names of the convives and something of the conversation which he heard or participated in.

MR. PENDLETON has been forced, since he took up his residence in Berlin as the American Minister, to study the German language persistently. In his youth he had some knowledge of this language, and even attended a course of lectures at Heidelberg. But what he had learned was soon forgotten, and upon his arrival in Germany he found himself in an awkward position.

ON the removal of Indian agent McGillicuddy from the Pine Ridge Agency the other day, Maj. Bell of the army, the new agent, took a census of the Indians and found there were only 4,500 Sioux and Cheyennes, though for years the Government has been furnishing rations, etc., for 7,300. Bad this for McG., his clerks and traders—must have dishonestly appropriated thousands.

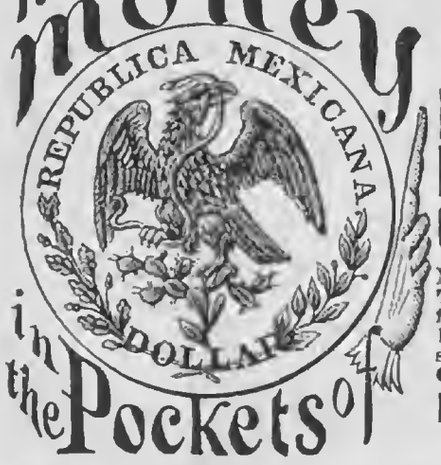
THE heart of Ludwig, of Bavaria, was taken from the body, placed in a silver-gilt urn of spirits of wine, and conveyed through Munich streets in solemn procession with a great military escort, while the bells were tolled and minute-guns fired, to a special train that bore it to Alcotting. There it was consigned to the monks, who have had in keeping the hearts of the kings of Bavaria for centuries.

JUDGING by what the editors-in-chief of the great New York dailies say of each other over and over again with the utmost emphasis and gusto, Charles A. Dana, of the Sun, Whitelaw Reid, of the Tribune, George Jones, of the Times, Joseph Pulitzer, of the World, William Dorsheimer, of the Star, Horace White and E. L. Godkin, of the Evening Post, are individually and collectively the most unmitigated liars and double-distilled rascals out of the calabooze or in it, and no one but a fool would pay the slightest attention to what any of them may say editorially or otherwise.

MCNEIL, the prominent Mass. Knight of Labor, is mentioned by a multitude of papers as Mr. Powderly's successor as General Master Workman, in case the latter runs for Governor of Pennsylvania. And he will be pushed at the Richmond convention in October, it is said, as the fittest man for the leadership, no matter whether Mr. Powderly is a candidate or not. The Mass. Knights, however, have just voted for Powderly Delegates; Powderly will not run for Governor, and McNeil says he will not antagonize the present Master Workman.

LORD HARTINGTON, the Liberal-Union leader, who has been Mr. Gladstone's chief opponent in the recent political struggle, is the eldest son and heir of the Duke of Devonshire, and is a man of tireless energy, with a remarkable love and capacity for study, and with a most tenacious disposition. He does not court popularity, and affects a manner of indifference and *ennui* when he comes into contact with people. In debate he seldom indulges in personalities, and hence few bitter things are ever said about him, and he enjoys the respect even of his opponents.

It is money in the Pockets of FARMERS.



TO MAKE FERTILIZERS AT HOME with POWELL'S PREPARED CHEMICALS FOR $12.00 You can obtain A TON of SUPERIOR PHOSPHATE

NO TROUBLE. Any boy, in ONE HOUR, can mix a TON ready for use. Intelligent, prosperous and leading farmers in every State as references. CHEAP, GOOD and PURE. I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
in my Remedy, I make the following offer:

I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.

"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.

"Have used the remedy with success."—D. G. BARBER, Easton, Md.

This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.

"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIS, Grant City, Mo.

"We would not risk feeding a pen of hogs without the remedy."—WHITE & Co., Gibsonton, Pa.

"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.

"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.

"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St. Paris O.

"I have sold over $2,00 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.

The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.

Prices, **$2.50, $1.25,** and **50 cents** per package. 25 pound cans, **$12.50.**

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1906. NEW YORK, AUGUST 7, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Horticultural.

Experiment Grounds of the Rural New-Yorker.

MORE NEW STRAWBERRIES.

DEWEY. Received from P. M. Augur & Sons, Middlefield, Conn., April 29, 1885. It is a seedling of Jersey Queen. According to our notes, it begins to ripen with the Sharpless, and continues later. The plants are low-growing, stocky and healthy. The peduncles are strong and often upright, and often hold the berries above and sometimes resting upon the leaves. Each plant produces a number of fruit stems which, having short pedicels, bring the berries in close clusters. The color when the berry first begins to ripen, is a bright crimson in the sun, and whitish in the shade; but when fully ripe, it is scarlet. It is firm enough for a near market, and perhaps for a distant market in a drier season. Seeds not deeply imbedded. The shape is variable. It is often nearly round and puckered about the tip, as if a flesh wound had been sewed together. It is rarely heart-shaped or regular; often broader than long. The neck is more or less stubby, reminding one of the Prince (of Berries). The flesh is slightly colored, quality good. The flowers are perfect. The size is very variable, the average being that of the largest berry shown at Fig. 308, p. 511, drawn from nature. The Dewey is very productive and is worthy of trial.

SEEDLING NO. 87. Also from Augur & Sons, and also a seedling from Jersey Queen. Plants received May 13, 1885 (pistillate). The foliage is strong and tall, remaining green and healthy through the season. Fruit ripens with Sharpless. The berries are large to very large and shapely, often broadly heart-shaped with short necks. They are sometimes contracted between the middle and tips like Crescent. Seeds yellow; flesh whitish; quality good to fine. Color scarlet; firm enough for near market only. This variety was at its best July 17 to 21. The berries were not then very firm, but of fine quality, large and rich. A later note states it was the best of our berries June 21. Our remembrance is that it continued to ripen its fruit as long and as late as any other kind. It is certainly a fine and desirable berry for home use, and is shown at Fig. 307.

GOLD. From same. Received and planted April 29, 1885. Same parentage as the above. Pistillate. It is a late berry, with tall, strong foliage, though less vigorous than that of seedling 87. Berries large, and of a light red color. The shape is roundish ovate, somewhat necked, not always fully ripened at tip. It is sometimes nearly round, sometimes larger in the middle than above; sometimes winged and broadly flat at tip. Seeds yellow; flesh colored and of good quality. The berry is not very firm. The vines are fruitful, and for home use it is a desirable late variety.

SEEDLING 65. From the same firm as the others. Same parentage—planted at the same time. Pistillate flower. Our notes are not very full as to this variety. The berry is light scarlet, broadly heart-shaped, sometimes winged, as in Fig. 309, page 511, and the quality is much like that of Jewell. It is quite firm. The plants are vigorous, though less so than those of Seedling 87. The following note explains itself:

"The history of the Dewey and the Strawberry Seedlings Nos. 87 and 65 is the same as that of Jewell, as they all came from the same batch of seed. The seed sown was one quart of Jersey Queen and one quart of Prince (of Berries). As it was sowed at one time, we cannot tell which are from one and which are from the other. Another time we shall keep seed separate when we sow it.

The seedlings you have from us were all raised in 1880. Jewell is the only one we have yet offered to the public. P. M. AUGUR & SONS.

For home use we should prefer either No. 87, Gold, or Dewey to the Jewell. The Jewell is earlier, firmer and perhaps more prolific. But No. 87, Dewey, and Gold are of good quality and as productive as need be desired. Of the three our first choice is No. 87, second Dewey, third Gold. Our illustrations show the berries true to life. If they seem small to the reader it must be considered that the portraits of all fruit (if not exaggerated) appear smaller in print than they really are.

SEEDLING STRAWBERRY No. 87. From Nature. Fig. 307.

STRAWBERRY NOTES AND EXPERIENCE.

E. WILLIAMS.

THE strawberry season of '86 has been conspicuous for its length, the abundance of the crop, and low prices. It commenced June first and ended July 10, a week later than usual and lapping that time on to raspberries. During all that time strawberries formed a prominent feature of our three daily meals very much to our satisfaction and enjoyment. In fact the only really satisfactory portion of the crop has been that consumed at home; the resulting profits, though not measured by dollars and cents, were none the less real. The quality of the crop may be likened to that of a modern barrel of faced apples—good at both ends and poor in the middle. For the first quarter, the weather conditions were favorable for a slow, well developed maturing of fruit of the best quality. Then followed 10 days of dull, rainy, misty and foggy weather, out of 14. This was a little too much of a good thing; the berries were gorged with water, the flavor impaired, and rust and rot attacked the plants and berries. During the last quarter less moisture and more sunshine prevailed, and the berries assumed their normal condition as to quality, and maintained it to the close of the season.

THE CRESCENT proved my earliest berry and was very productive and lasted till July 1, maintaining a fair size to the end and proving perfectly healthy. While the quality is not of the best, yet when served with sugar and cream (or without cream), cake, good bread, and genuine butter, as they usually are, I have never yet seen Crescents refused. I only wish every table in the land could be well supplied with as good.

THE SHARPLESS stands at the front as one of our largest and most attractive berries; but it is not very productive, and a large portion of the fruit rots before ripening during such weather as prevailed this season. The quality is not high, but as it has less acidity than some others, it pleases many tastes when fresh and not too ripe. Its popularity seems to be on the wane.

JERSEY QUEEN has proved to be one of the largest, handsomest and most productive of our late sorts. The plants are vigorous and healthy, and the fruit is of good quality, though acid. This acidity would be toned down in a drier season and there would be less loss from rot.

MANCHESTER was large, late and immensely productive but it blighted so badly that the bulk of its crop was lost. It has never been so badly affected with me before. If the tendency proves permanent the variety must be discarded.

THE JEWELL proves to be one of the most vigorous and productive, as well as the largest and handsomest varieties; but the excessive moisture proved too much for it in matted rows. Blight and rot injured it severely, though in single rows it withstood these troubles. While its flavor is not of the best, its other qualities promise to make it a leading popular sort.

THE ATLANTIC disappointed me early in the season, in its promises, and later it disappointed me in doing even better than it promised.

The preceding four varieties composed my last picking, and closed the season.

DURAND'S PRINCE maintains its position as the best in quality of all I have fruited this season, and gave a good crop. I was surprised to see the Editor of the RURAL report that it ripened unevenly. I have never seen any tendency of that kind, either on my grounds or elsewhere, and I incline to think it a break on the Rural Grounds, that will not prove permanent.

DOWNING. This old favorite bore a light crop and was badly affected with blight.

LARD'S (VINELAND) SEEDLING bore a large crop of medium-sized, soft berries of only medium quality. The foliage and fruit-stalks are very tall, exceeding any other I have.

CUMBERLAND TRIUMPH sustained its repu-

tation as a large, early, productive family berry of very good quality.

MRS. GARFIELD, a light cropper, is a good-looking berry of indifferent quality.

DANIEL BOONE is a much better cropper, but too poor in quality to be recommended, and both must go as has the Vick. Unless these three varieties have shown better qualities elsewhere, especially with the originators, it were better that they had perished at their birth-place. They are no compliment to the illustrious persons whose names they bear.

MISSISSIPPI VALLEY and DAISY MILLER are two new varieties. I have been trying for the past three years to find out what they were good for; but up to this time one word expresses all I have found, *viz;* nothing.

During the past 20 years I have written this epitaph, "Not worth a name," for a goodly number of seedlings. I hope the present movement to have new fruit tested by competent committees, and when introduced accompanied with a proper certificate of merit, will prevent the introduction of so many worthless varieties. If the purchasing public would demand this course, it would be money saved for them.

DURAND'S KING CLUSTER, among the new varieties which made so favorable an impression last year, has maintained its promises again this season and has secured the American Institute's prize for continued excellence. This I see is to be introduced as the "Crimson" Cluster, as has been stated in the R. N.-Y. As it has been known as King Cluster for years and widely known of late, a change at this time of name seems impolitic and totally at variance with all established pomological rules.

EXPERIMENTS IN WINTERING CELERY.

THE variety was Golden Heart, planted August first. The latter part of October the earth was drawn up to the plants as for blanching, but it was done to protect them from freezing on cold nights. The last of November, fearing that Winter might set in and freeze the earth solid, I dug the plants one warm afternoon. Grasping the stems in both hands, in such a way as to prevent injury to them, I beat the earth as clean as I could from the roots. Then after all defective stems had been plucked off, the plants were placed upright in bottomless boxes (old bee-hives) as compactly as possible. Next, about two-thirds of the foliage was cut off, through fear that the celery was so very densely packed that it would suffocate and rot. Then, having inserted the nozzle of a tin funnel here and there through the tops of the remaining foliage, sifted quicksand, such as is used for making mortar, was poured into the funnel till all the interstices between the stems were filled up to the foliage. The boxes were on the earth-floor of a dimly-lighted and cool cellar, where a little frost sometimes entered. Earth was banked up around the boxes three or four inches; a pailful or two of water were poured on to the sand in the boxes, and the operation was repeated every 10 or 15 days. It was three months before the plants blanched and were in nice condition. The hearts were solid by March 15, when they were sold. At the time of digging, the small plants were "heeled in" in a dark room of same cellar against sloping earth. First, a tier of plants was laid as closely as possible; then a layer of mellow earth sloping for a second tier of plants, and so on, earth and plants alternately. We used these in the family till May. Some of them were wet once or twice with water, and these commenced rotting first. The beating of the earth off the roots allows the packing of three or four times as many in the same space as with the earth left on, and the second experiment proves that a lighted cellar is not necessary. If the plants could be kept cold nearly down to the freezing point, we probably could have celery till June or July. S. D. N.

CALIFORNIA LETTERS.

PROF. W. A. HENRY.

Climate of Southern California; olive growing; propagating the olive; longevity of the trees; orchards without irrigation and with; making olive oil.

I FIND in this portion of California an almost undeveloped country, but one of great possibilities and well worthy of the most careful investigation. With one of the most equable climates on the globe, semi-tropic at all times, but not so hot as to be enervating, fruit growing can be carried to a marvelous degree of perfection hereabouts, as shown by the small areas already in cultivation.

While many fruits flourish here, I will mention only the olive, at this time, as one well worthy of more attention. About National City on the Bay of San Diego, are growing some 12,000 olive trees, about half of which are now bearing profitable crops, but all are quite young. A large proportion of these trees are on the lands of Messrs. Warren and Frank Kimball, of National City, to whom I am indebted for many kind attentions and much that I have learned of this section. The olive resembles the willow somewhat in its leaves, which are long and narrow, being an olive-green above and whitish below. The trees are trained with shapely heads and present a fine sight in the long rows in the orchard. I notice quite a tendency to throw out shoots from the stem and at the ground, which is counteracted by free use of the knife. Trees have been usually set 20 feet apart, but this is now held to be entirely too close, and 25 feet is now the standard distance. A cutting as thick as a walking-stick, and from one to two feet in length, is placed in the nursery row, or, better, where the tree is to stand. In about five years the tree yields a little fruit, but for an olive orchard to begin giving good returns one must wait from eight to ten years. The longevity of the tree is remarkable, as we know from the history of the olive in Europe and Asia, and here there seems no exception to the rule. At the Old Mission near this place, which was built a century ago, there can be seen an olive orchard of about 300 trees set by the fathers at that early date. Through all the vicissitudes of a century this group of trees have stood, and to day the trunks are as sound as ever, the foliage as green as when it shaded the converted Indians that carefully tilled the soil beneath, and ripens fruit for the American as freely as it did for the Spaniard. These trees are the parents of about all the olives of this State, I am told, no imported variety proving to be of equal merit.

Though the olive will grow on poor soil, it responds to the best that can be given it, as do most other plants. In this section water is the one requisite, and though the olive cannot go without any, it will do with a very moderate supply if properly applied. As the small rainfall is confined to the winter months, the land in the orchard is carefully tilled at that season so that all the moisture from the clouds is caught and held by the soil; when the rain ceases the cultivation is kept up and the dry soil at the surface forms a mulch that in a most remarkable manner conserves the moisture below. Mr. Frank Kimball has an orchard of 10 acres now carrying a heavy crop of olives, that has had no irrigation for three years. To attain such results there must be a retentive subsoil and the best of summer cultivation. I thought, as I looked over this orchard so mellow that it resembled a garden just ready for seeding with not a weed in it, that we of the Eastern United States could take some lessons in cultivation of our California brothers. Yet most of the olive orchards will have to be watered once or more each Summer. Most of the water for irrigation purposes hereabouts is raised by large windmills from wells varying from 10 to 100 feet in depth; a few parties use steam engines. The water is stored in elevated tanks and supplied to the orchard through iron pipes and rubber hose. To irrigate a tree a cup, as it is called, is dug about it; that is, the ground is loosened and drawn back from the stem so as to make a cavity small if for a young tree, but often eight or more feet in diameter, for large ones. The water pours into this cup from the hose and soaks away to the roots below: when enough has been applied the soil is put back to its place again. Thus the tree is watered and the soil mellowed thoroughly about each, which is a great advantage.

So far all the olives raised hereabouts have been pickled; but this year the gentleman before mentioned will put up an olive press and extract the oil. This is, I understand, a simple process much like cider making, and the oil expressed is easily handled. So far the little oil manufactured in the State has found a ready market, I learn, at excellent prices. There seems to be no reason why olive growing should not become a business of great magnitude in California, and large orchards will no doubt be planted in many places. Thus another industry may be added to our list, and occupation be found for more people. Those who have studied it most, say that with present prices this business will pay about as well as orange growing. How this may be I cannot say, but I feel confident from what I have seen that the tree is at home in this section and that it fruits abundantly; so the primary condition of success is assured.

San Diego, Cal., July 10.

Farm Topics.

CORRESPONDENTS' VIEWS.

THE country along the coast here is well adapted to bean raising. We frequently see 100 acres in one field. Lima beans are raised here without poles. They are planted in rows four feet apart, and grow all over the ground. In the Fall they are cut below the ground with hooks or a plow made for the purpose. They are dried and then hauled to a tramping ground and tramped out. The yield is often from 15,000 to 20,000 pounds per acre.

Santa Barbara Co., Cal. G. H.

THE quality of our stock here is, as a rule, poor. It is improving, though. Quite a number of Jerseys have been brought in of late years, and have made their mark upon cattle, particularly on the town cows. Good grade Jersey bulls run at large and serve the cows. Grade Jersey cows are most esteemed in the towns for "family cows." A. G. N.

Marshall, Texas.

I LIKE the talk on butter-making by "A. E. S." Is it necessary to soak butter-tubs with sour milk? I always put in salt and pour on boiling water, let it stand covered till the next day, then turn the water off and scald again. [Many use sour milk, which is excellent for cleaning or removing the taste of wood. It is not "necessary," as hot water and salt will answer.—EDS.] The birds are unusually plenty here this Summer. We have a perfect colony of barn swallows, which seem to be disappearing in many places. We have 45 nests in a space of 30 feet. They ate the cherries faster than we could. Two robins had a most amusing quarrel with an old hen.

Tompkins Co., N. Y. E. L. B.

EVERY "practical" man enjoys hitting the agricultural colleges of the country. It is much easier to tell how to do a thing than it is to do it, and hence their advice flows as freely as water. Many of the agricultural colleges have been obliged to crawl under the sheltering wing of a "University" in order to die properly, but these same "practical" men are, in a measure, responsible for it. Farmers can safely make up their minds that they never will have any agricultural college until they interest themselves. In Michigan and Kansas where farmers have fought for such a college, sent their sons to it and defended it, there is very little growling about any failure. Farmers expect too much of these schools. They growl if a boy does not pick up in four years' time an amount of information that they could not acquire in a century. A college boy is obliged to invent answers or hear from all sides "you ought to know; you have been to college." These farmers would not trust their lives in the hands of a year's graduate at a medical school, and they would hardly put a law case into the hands of a young lawyer who had nothing but a college diploma to show. Why then blame an institution because it fails to disprove the old saying—"A fool can ask questions that a wise man cannot answer." Many of these same "practical" men are the most foolish specimens of humanity in regard to the education of their own sons. The little second-class colleges are filled up with farmers' boys. Will they make farmers? Not much! They are fitting themselves for cross-roads lawyers, country school teachers, and starving doctors. You can't make a first-class professional man out of a second-class scholar. The RURAL is right in saying that farmers can build up these neglected colleges if they really want to do so. Let them send their own boys there. There is a foundation for a good farmer's college in every State in this country. Send in students and there will be no cause for the growling we now hear. GRADUATE.

WHO have noted any ill effects from eating strawberries? We are told to eat all the fruit we can. I believe it is possible for one to eat too much. I am satisfied that several cases of severe constipation during the past season were caused by an excessive use of strawberries. It may be that some persons are more liable to be troubled in this way than others, or that the trouble was caused by the seeds rather than the berry itself, but that the fruit caused the mischief is beyond question. The fact is that the intemperate use of any article of food will render it harmful. C. H.

Bergen Co., N. J.

WE plowed up out of land that my father entered from the Government, a tool that makes the best thing we have seen for digging out burdock, thistles and such like weeds. The blade is four inches wide, eight inches long and three-eights of an inch thick. It is of metal like that of an ax. No one knows what it was originally, but for digging dock it is the best tool we ever saw. It does not tear up the sod like a spade. We fastened an old pitchfork handle to it. J. P. S.

Palmer, Ill.

I AM glad you speak well of the Early Harvest Blackberry. It produces a fine crop with me. Began to ripen June 16, and continued till the Snyder ripened. Snyder would not stand the drought, while Early Harvest was not affected. Glad to see that you begin to understand Prohibition. A. H. GRIESA.

Douglas Co., Kan.

I KILL rose bugs with a preparation consisting of one part sulphur and one part tobacco dust. Mix them well, apply in the morning when the dew is on the plants, three times a week. Dust the mixture over the plants. If rose bushes look yellow use barnyard water mixed with bone dust, one pail of the former to a pound of the latter. Put a half cup to each plant three times a week. It will restore the color. J. S. B.

Hightstown, N. J.

I SAW in a late RURAL an illustration of the Hilton Strawberry. I had a Sharpless that measured eight and one-half inches one way, seven inches around the other way, grown on a runner plant. Sharpless, Manchester, Parry, Atlanta are the four best out of 25 kinds. I have sold berries of these kinds up to the 16th of this month for 12 cents but when raspberries were selling for five cents. W. G.

Auburn, N. Y.

I PUT in two rows of Early Ohio Potatoes, flat culture. I wish now I had planted all my potatoes that way. Contrary to my expectations, they were easy to dig. No more hill business for me. J. I. C.

Detroit, Mich.

"HAY SEED."

T. H. HOSKINS, M. D.

I SEE that many of the agricultural papers are congratulating their readers upon the passage of the oleomargarine bill through the U. S. Senate. I fear the congratulation is premature. Among the Senate amendments I find, first, that the tax which made the bill ostensibly one for revenue, is retained, but lowered to two cents a pound. This retains the constitutional objection for whatever it may be worth, and at the same time makes the taxation feature valueless as affecting the profits of the manufacture to any practical extent. Certainly this was done in the interest of the oleomargarine men. But the fatal amendment was the insertion of the word "knowingly," which throws the burden of proof upon the Government in every persecution, to show that the dealer "knew" he was not selling genuine butter to his customer.

The old foxes of the Senate are happy, no doubt, at thus emasculating this "hay-seed" bill, which they feared directly to kill. Anyone who has ever been much about the halls of legislation, either State or National, knows full well the waves of ridicule and contempt that are set in motion there by the introduction of any sort of "hay-seed legislation." Such bills fare worse than anti-liquor legislation, because they, as a rule, have no such backing among the voters. They are despised, while the others are hated by our practical politicians; and this feeling is reflected in the general newspaper press, the witlings of which circulate the moldiest of "chestnuts" in reference to the subject.

"Why is this thus?" The business of agriculture holds at its control the bulk of the productive capital and employs directly and indirectly a large excess of the labor of the country. And, notwithstanding the current sneers that meet us daily in the press, the fact cannot seriously be disputed that far more men of intelligence and broad information are engaged in the conduct of American agriculture than in any other of our great national industries. That there are a large number of uneducated and more or less ill-informed men to be found upon our farms may be conceded, but facts will back this statement that the educated farmers of America constitute a very large body by themselves—a body that could numerously outvote any two or three other classes, I think any five or six of the leaders and directors of productive industry on this continent.

Why then are we so weak, politically? How is it that the legislative houses which are supposed to contain the ablest and most experienced of our public men are the houses where agricultural interests are least regarded, and agriculture (while often complimented to turn an elocutionary period) has no power to influence legislation? There can be no reason save lack of leadership and lack of union—of that union which is strength; strength that law-makers and law-dispensers will respect. Agriculture, politically speaking, is a giant—but a palsied giant.

It is the work of every agricultural journal, and of every agricultural organization, to make "hay seed" respected. Hay is our biggest crop, but where is "hay-seed" in politics? Away down in the bottomless pit of innocuous desuetude. It is said, in explanation, that the interests of American agriculture are so varied and dispersed that the farming element can never be made a powerful factor in our national affairs. I do not believe it. Old

political issues have died out, or have been settled. Industrial questions are now pressing strongly to the front, and are attracting the attention both of practical and scientific politicians, of legislators and political economists. The greatest of all industries is agriculture, and the greatest of all public questions is the question of agricultural prosperity. It should be the foremost subject of discussion, but it is hardly discussed at all. Even our best agricultural journals do not handle the political relations of agriculture with any mastery of the subject, while elsewhere in the press and the forum it is all but utterly neglected. What American political economist has made himself noted, or even known, as an educator of the farmers in the matter of their public rights and duties? Our greatest of industries, the fundamental industry of all, attracts the least intelligent attention, the least thought and the least activity of all. Are we going to do anything about it? Probably not until we are absolutely compelled to do so.

Orleans Co., Vt.

COOLING JACKET, A SUBSTITUTE FOR ICE.

THE hot weather is now upon us, and many have no ice to cool the drinking water. If they had ice-water, it is not a safe drink for perspiring harvest-hands, and on the other hand, warm water is not pleasant. Cool well or spring water is the ideal drink, and how to keep it cool in the far-away hot field, is the problem the cooling jacket solves.

Procure a large jug, and cover it to a thickness of half-an-inch with one or more layers of any kind of coarse cloth, carpet or other material. When filling the jug, saturate the jacket with water. Keep the jug in a windy, shady place, and the evaporation of the water in the jacket will absorb enough heat to keep the water in the jug pleasantly cool.

A tin pail, fitted with a very fine wire gauze lid, and a heavy saturated jacket, set in a raised, shady window, furnishes a far better place to keep milk pure and sweet than nine-tenths of the household refrigerators, which usually contain a little of everything else but sweetness.

I. P. ROBERTS.

Sheep Husbandry.

Notes from the Western New York Farm.

BETTER PRICES FOR SHEEP.

IN a recent trip into and through Central Michigan for the purchase of ewes for my winter lamb raising, I found sheep scarce, the market very strong and few for sale at any price. Those people who last year heeded the RURAL'S advice to hold on to the sheep for better times are now happy. Such sheep as one year ago were sold for $1 (many less) thousands of which were slaughtered for pelts, hams and tallow, are now quickly taken at from $1.50 to $2 each.

As might have been expected, the very persons who sold their sheep last year at these ridiculous prices are now eagerly paying double the money for sheep no better than those sold, and can hardly get what they want even then.

The immediate causes of this change are the real scarcity of sheep, and the rise of five or more cents per pound in the price of wool. The scarcity of sheep is caused by the insane slaughter of thousands, as before mentioned; the loss of millions of sheep in Texas, caused by the protracted drought and also by the neglect of hundreds of farmers to breed their ewes last Fall. The advance in the price of wool is caused by the short clip in this country due to the decreased number shorn and also by the diminished Australian supply due to the loss of millions of sheep by the excessive and long continued drought. It is needless now to preach a sermon on the folly of being disheartened and going out of sheep every time there is a depression in the prices of sheep and wool. Every one can now see the folly of such a course.

Those most badly discouraged last Fall are now most eager to buy, and as a result I think the prices of sheep likely to go unreasonably high, and unless men are very careful about what they buy, and how they care for what they buy, they may find that they have again made a mistake. It is a safe rule to keep steadily on with the flocks, carefully weeding out the poorer and breeding with a view to increasing the size, improving the form and securing increased length and fineness of staple and freedom from an excessive amount of grease, and the largest quantity of cleansed wool. Even in the worst years if the lambs are well cared for and sold, with wool even at the past low prices, sheep will pay as well as any other product of the farm, and sooner or later the change will come, as now, and then the profits will be beyond those from anything else. Besides all this, nothing so much assists in keeping the farm free from noxious weeds as a flock of sheep.

WILL THE ADVANCE BE PERMANENT?

I am asked this question daily and many times each day. Of course, everybody will now rush into sheep, and likely many will refuse to sell even the older and those that for other causes should be sorted out and fattened. The tendency of such a course is to rapidly increase the flocks; but it will take several years to make up the numbers lost by drought in the various sheep countries and those slaughtered, and before such time we are likely to have better times through a general revival of business, so that I firmly believe it will be many years before prices will again be as low as in 1885.

I have the ewes now all home and the males put with them, and some of them have been together for more than a month. I am greatly in hopes of being able to send some lambs this year in time for Christmas dinner.

Through the solicitation of Mr. James Wood, of Mt. Kisko, N. Y., who has one of the finest flocks of Hampshire Downs in this country, I shall try a male of that breed on one bunch of my ewes. The Hampshire has more size than either the South Down or Shropshire, and it may be that I shall find this cross superior to the Shropshire. I have just received a ram from Mr. Wood's flock, and shall try him carefully as a guide for the future.

Wheat is now all cut and is a correct index to the character of the farmers on those farms on which stock is fed and plenty of manure made, or on those farms on which plenty of fertilizers have been applied. The crop is good; on some very, very good. The field of hand-picked Diehl-Mediterranean is very stout and would not take second place in the very best wheat years. I think it will thrash out away above 40 bushels per acre. It has come very true and yet I have found a half dozen or less heads in every way like the other, except that they have no beards. I shall make a further selection, as this is without doubt the best wheat in this county, and is worthy of being perfected.

I have several of the RURAL'S crosses, and among them a cross between Fultzo-Clawson and Landreth; also one between Diehl-Mediterranean and Landreth. Each of these has already broken up into many very distinct types, some of which are wonderful in their promise. I shall be greatly surprised if from one or other of these crosses a wheat is not produced that will repay this country a thousandfold for all the RURAL ever cost. Few realize what its editor is doing in systematic, honest experiments.

J. S. WOODWARD.

Dairy Husbandry.

DAIRY NOTES.

THE same trouble exists among dairy farmers in England as in Wisconsin, according to Prof. Arnold. They, too, are struggling to make milk and beef from the same animal, and many of them eschew all the advantages they might reap through co-operative dairying. He says: "The idea of beef in a dairy cow appears to be inseparable from the minds of English dairymen generally, as well as from the minds of many dairymen in the United States; but beef dairymen, wherever met with, are the men most generally found struggling at the wrong end of the car of progress." He further says that he listened to an essayist who had for his subject the "Selection and Management of Dairy Cattle," and after describing 13 breeds of dairy cattle, in his innocence and hide-bound prejudice he outlined the pedigreed Short-horn as the model dairy cow, and gave her points and curved lines, so as to put in as much "beef and beauty" as her skin would hold! No doubt the old Professor gasped, and wondered whether he had crossed the ocean to be thunderstruck with such wisdom!

* * *

I hear of one sensible dairyman in Dodge County (W. T.), who, finding his pastures "brown and bare" from the parching drought, instead of lamenting that all was lost and proceeding to starve or sell his 40 good cows at half price, put them into the barn to keep them out of the burning sun's heat, and fed them all the bran-slop and old forage they would eat, and thus, in a sense, he defies the drought to dry up his cows. The result will be the milk will pay for the bran in cash down and he will have made a deposit of about 80 per cent. of the cost of the bran in the bank of the farm—the manure—which he has increased in value so much, and which he can draw checks on next year in increased crops. Besides, it is going to rain some time, and when it does, and his pastures are again green, he will have rollicking, well-fed cows to earn big money at making butter and cheese in the Fall, when the prices are higher. Why don't farmers who can add figures correctly and reason a little, see it, and save their cows? No matter what may be the price of butter and cheese to-day, if a man owns a good cow, it would be as stupid for him to let her starve, or half starve, as it would be to let his property burn for the sake of saving the water it would take to quench the flame. It doesn't take any long-invested capital, either, to save the cow; for her milk, if kept flowing, will pay every day in cash for what she eats. Unlike an unemployed horse, she works every hour of her milk-giving life at earning money; and to feed her is only to lend her money on the shortest of time and on the best of security.

* * *

I disagree with the cheeseman of the Chicago Live Stock Journal, in imputing fine pin-holes in cured cheese to tainted milk. They are present in the sweetest and cleanest flavored cheese, and are the result of putting the cheese to press with the curd not acidified enough to take them out. A badly tainted curd can be held till the cured cheese resulting will be as solid as butter. It is all a question of acid developed; though it is admitted it takes longer to eliminate the gas from sweet tainted milk than from that clean-flavored. Probably nine-tenths of the fine cheese of the world are not entirely free from fine pin-holes; and to teach the novice that when he sees them, he is to draw the conclusion there is rotten milk present, is to slander the cheese, and excite his disgust without cause.

* * *

With regard to the action or rather inaction of the dairymen of the country in relation to oleomargarine legislation, the Chicago Live Stock Journal says that dairymen and farmers generally are a wonderfully slow and impracticable class when it comes to defending themselves or their calling from assault. Scattered and unorganized, they stand with folded hands, wondering what is to be done, while the enemy goes on doing. Somehow, they expect somebody will rise up and defend them, or they will be saved by some sort of miracle. Witness the fight that has been going on for months against the counterfeit butter gang. What are the dairymen and farmers, as a body, doing? The whole brunt of the battle has been thus far borne by a few men, who have not only done the fighting, but furnished "the sinews of war."

The enemy is alert and energetic, while the dairymen take no active interest, and apparently expect somehow to be saved by a sort of miracle, or fortuitous turn of events. Let them remember the adage: "God helps those who help themselves," and come to the front and report for duty.

* * *

The truth is they are unorganized and partly dazed by the audacity of the assault upon the solid old industry the cow stands at the base of. They are like the mighty North before Fort Sumter was fired on—their wrath not yet kindled into a sweeping flame. But if betrayed now they will be like what the Massachusetts Captain said the North was—"Hard to start, but a sight harder to stop after they got to going."

The truth is the case is so plain that the mighty mass of farmers and consumers assume their representative Congressmen and Senators need no urging to pass the laws outlined by the House Bill. If these want to learn what scorn and wrath mean, they will have a chance if the bill fails to become a law. In such case there won't be any skepticism about there being a "hereafter" for such of the politicians in the dairy districts and dairy States as help to defeat or fail to stand up for it. "He who is not for us is against us," and will have to drain the political "hemlock" to the dregs.

"BADGER."

Wyoming Co., Wis.

DOING THE "ODD" THING.

MANY times it pays to do the "odd" thing, or that which others in the community neglect. A friend of mine went "out West" and located in a cheese-making district. He found that farmers sold all their milk to the factories and got rid of the calves as soon as they could. My friend had a little ready money to be used as capital. Instead of selling his milk to the factory, he went to raising heifer calves. He bought a fine Holstein bull and offered his services for a very low price on condition that the calves should be his if he wanted them. It kept him busy picking them up and bringing them home. The steers and the poor heifers he kept a few weeks and then sold them to the butchers. The best

DEWEY STRAWBERRY. From Nature. Fig. 308. (See first page.)

SEEDLING NO. 65. From Nature. Fig. 309. (See first page.)

heifers he kept and crowded them into cows. He fed his milk, oil-meal, bran and all the skim-milk he could pick up. People laughed at him because he did not turn his milk right into cash, but he beat them in the long run. The very men who gave him the calves came and bought the same calves back after they had grown into cows, and they had to pay a round price, too. A man could not do this unless he had money enough to carry him through a year or so, but he is sure to get his pay in the end. It seems to me that there are plenty of places yet where this plan could be worked. C. W.

Plymouth Co,, Mass.

A CONVENIENT ROOM FOR DAIRY WORK.

The room shown at Figs. 310—311 was built on the east side of the stable to have it conveniently near the house. The pump is the width of a carriage-drive from its door. No offensive odor reaches the milk-house from the stable, and if there did, it would not affect the

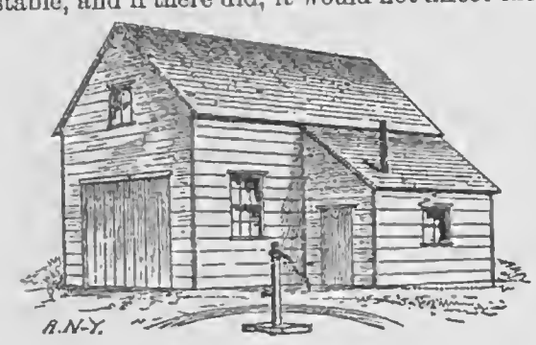

Fig. 310.

submerged milk, the cream being all raised in a Cooley Creamer. Most of the milk and cream is sold in town, so our milk-house is used to wash a large number of cans in, varying in size from one to eight gallons. Of course, in lifting the dripping cans from the tank, and in washing the large vessels, there is more or less slop every day, and to clear that away in the easiest way, I have made a slope in the floor in two directions, so that the spilled water makes its way toward a little outlet made for it in the north end of the building. The slant in the floor is not noticeable to the eye, but the water readily finds it, and when the room is ready to be left for the day, a little dashing on of water and broom service soon leave the floor clean. The little door where the water runs out (see Fig. 311),

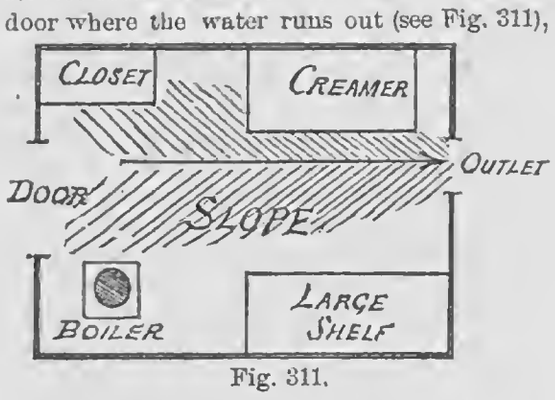

Fig. 311.

is 18 inches square. A drain carries the water away—that which is swept out and the overflow from the creamer. The sleepers were laid a trifle lower at the north end, and were hewn down a little to make the two slopes. In arranging the places for the cans, etc., no stands with legs were allowed. They would make trouble in moving when the daily floor washing is going on. Shelves are used, and where the largest utensils are placed, a large shelf was made, two feet from the floor, with bracket supports, and to make it stronger it is suspended also from the rafters above. Another shelf was made above this for covers, etc. In the corner near the door stands a large furnace boiler in which the water for washing the cans is heated. It is large enough to roll an eight-gallon can in it, and here the cans are scalded. MRS. S. E. H.

Greeley, Colo.

The Poultry Yard.

HINTS ON POULTRY.

HENRY HALES.

Caution needed in beginning poultry raising; poultry raising mania; exaggerations of profits; necessity of study and investigation; profits come from care and knowledge.

At the present time poultry is commanding more than usual attention. Poultry journals are springing up like mushrooms. It is only about twelve years ago that the first was published, when the Poultry Bulletin made its appearance as a new venture; now there are a great many all over the country. Incubators and brooders are being manufactured with many different devices for regulating the heat, each one claiming some peculiar advantage. The sale of these incubators has assumed large proportions, and the advertisements are of a captivating character, considering how many people like to make a living easily. Many people are embarking with great hopes and little capital in a business they are quite ignorant of. They see the chicks hatched in the machines (as they are called) and they suppose the hardest work is done. Now, I am not speaking to the fancier who well knows the uses of the incubator; but to those who have had no experience in the poultry business and are apt to suppose chickens are easily raised in Winter for early broilers at immense profits, nor am I saying this cannot be done. I would simply call attention to the expenses after a fair deduction for losses, and the labor that must be expended. In raising those early chickens few people without experience can tell the care, warmth, food and time it takes to raise 100 such chickens. They are apt to be carried away by their own feelings rather than to look fairly into the circumstances. In just the same way there was a trout-raising mania a few years ago, which led many people to spend large sums of money in preparing brooks and ponds for the raising of trout, which were to realize one dollar a pound in the market. The trout were easily hatched and those who were first in the business made money by selling the young hatched fishes, but who ever heard of a pound of trout so raised ever reaching the market? And it will be a long time before our markets are over-stocked with early hatched broilers.

In saying this I do not wish to discourage those who contemplate keeping poultry, or even raising them for eggs or for the market; but I wish to offer a caution against persons being led astray by misrepresentation or their own heedlessness. It is one of the chief objects of the RURAL NEW-YORKER to set people right in the various departments of agriculture, fruit-growing, stock, etc., without fear or favor, and I see many such general acknowledgments in the press that there is no doubt that it is doing the public a good service that should be generously acknowledged. In regard to poultry, the very highly-colored exaggerated accounts of the great profits and little labor in raising poultry, that appear from time to time in some papers, are apt to do more harm than good to the legitimate business of poultry-keeping, and should therefore be discountenanced by all fair, honest people, who are well enough informed. There is profit in poultry as an adjunct to the farm. Poultry-keeping is one of the most profitable departments of farm work when properly conducted. Most farmers know this, and many take fair care of their stock. But those who are totally unacquainted with the business should take good care to get well informed before embarking in it too deeply. They should find out the state of the markets in the locality where they wish to locate; the suitability of the land for such purpose; the amount of capital required, to say nothing of the many things to learn in respect to the practical part of the work, such as the best breeds for the purpose intended, whether for the production of eggs or the sale of the birds; the proper kinds of buildings, yards, etc. Then there are the interior fittings of nests, perches, dust baths, feed hoppers, water utensils and ventilation. Incubators do, and will play an important part in the business under proper management; but too much must not be expected of them. Too much is generally at this time claimed for them. Much stress is laid on their keeping the chicks free from parasites; but what practical poultry man will allow his birds to be tormented by such vermin? It is as much a poultry-raiser's business to look after such things (and to a practical person it is not as much trouble as some suppose) as it is to feed and otherwise care for his flock.

The feeding of the young chickens with suitable food, to keep them growing and in health, is something to learn. One should also know the best temperature and the right sort of ventilation for their health. He should also be well acquainted with the cause and symptoms of poultry ailments, so as to be able to tell what is the matter when any get sick, and to decide promptly what to give to check or cure the trouble before it infects the whole flock. When the birds are old enough to lay and eggs are scarce, then comes the test of the business capacity, to know how to induce the hens to lay, by judicious feeding, proper warmth, cleanliness, etc. All these things can be learned by a person of ordinary intelligence, but can only be put to practice by more than ordinary industry to make a successful business of poultry raising. The whole business is made up of apparently small details, which must not be in the least neglected if success is to crown the undertaking.

Rural Topics.

FARMING IN NEW ENGLAND.

I own about 110 acres of land away down here on Cape Cod, about the last place where one would think of farming for profit. I am a blacksmith by trade; have worked at it more or less for 40 years, but my farm has paid me better than my shop has ever done. The man who occupied the place before I bought it, kept one horse, one cow and sometimes raised a calf. The year I bought the place, I cut from a quarter to a half ton of grass; now I get eight or ten tons, and some seasons more. The farm is now worth four times as much as it was when I bought it, and here is some account of what I have done by way of improvement.

In 1853, I began to plant forest trees—mostly pine seed. I had hills and barren places which bore nothing but poverty weeds; there I planted the pine seeds. Now I have about 18 acres of quite valuable wood-land. On the place I had a swamp and boggy marsh of little account as it was. I commenced working it into a cranberry bog. From it I obtained a lot of muck and peat, a good material for cows, pigs and hens to work into dressing. My land joins a salt water pond, from which I get plenty of seaweed, which is quite an item for bedding and dressing. I keep six cows in Winter. I run a milk-wagon the year round. In the Summer I keep nine or ten cows. We have so many people from the cities at that time I can sell all the milk I can make, at seven cents per quart. My land is all within fence. I cultivate about 16 acres; the rest is for pasture for the cows.

Most of my fences are hedge, made from red cedars set when small; they are very easy to transplant. In some places I bend down oak and pine trees. If this is done at the proper, time they make the best of fence; but if neglected, as it often is, until the cows get out in June or July, and the trees are then cut that ought to have been bent down in February or March, they die out and the hedge is condemned. I have seen lots of this kind of management. I keep from 300 to 400 hens. We think they pay very well; but, like other things, they want care and attention. I set from one-quarter to half an acre of strawberry vines every Spring. I have apple, pear, peach and plum trees, also grape vines, all of my own setting. I have about three-fourths of an acre for garden truck.

We are not all alike. What may be satisfaction and enjoyment to me may not interest others. I am pleased to look out on the acres of green forest trees I have planted. I love to see the fields of green grass, of corn and oats and rye; and the cranberry bog, too, with its rich harvest. I enjoy the springtime when the fruit trees put forth their buds and blossoms.

Now I would not give to young men the advice Horace Greely gave, "Go West;" but I would say stay East, buy some run-down farm, or some place that has never been improved as it could have been. There are plenty of places here in the New England States, that can be bought very low. People still go West, and their farms are sold at auction for less than half the cost. The young men go off, thinking they can do better elsewhere, but the current will set back again in time. No, I would not exchange the rough and rocky hills and valleys and sandy shores of Cape Cod, here in New England, for the rich prairies of the West.

Our land is poor, I know, but what we raise is worth something. We don't raise corn for fuel, nor sell our milk for two or three cents per quart. We never yet have been exposed to cyclones or blizzards.

I think if a young man will settle down on some place with his mind fully made up to stay, then with proper management and economy, with willing hands, he will succeed in getting a comfortable living here.

Osterville, Mass. S. L. L.

Farm Economy.

TRAP FOR DRAIN.

Robert Crain, Jr., of Bucks Co., Pa., was greatly troubled for a time by having rats, snakes and other vermin crawl into his drains during dry weather. To prevent this nuisance he uses the trap shown at Fig. 313. The

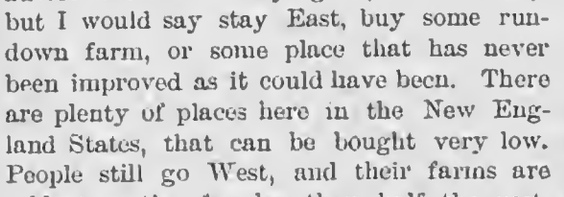

Fig. 313,

end of the tile is cut away, as shown. The trap is made of galvanized iron, heavily wired around the sloped end for the lid to rest on. A brass hinge is used, to prevent rusting. When the water flows down through the drain the trap is lifted by the force of the water until it assumes the position *a*. When the water stops flowing, the cap falls of its own weight until, when the water ceases, the opening is closed. Mr. Crane found that muskrats crawled up his drains into the fish pond to destroy the carp. One of these traps placed at the lower end of the drain prevented any further trouble. One placed on the end of the house drain will give good satisfaction.

HANDY PARING KNIFE.

F. H. Rood, of Wyoming Co., N. Y., makes a very serviceable knife for paring apples, potatoes, etc., as shown at Fig. 312. With a cold chisel cut a piece off an old scythe ¾x6¾

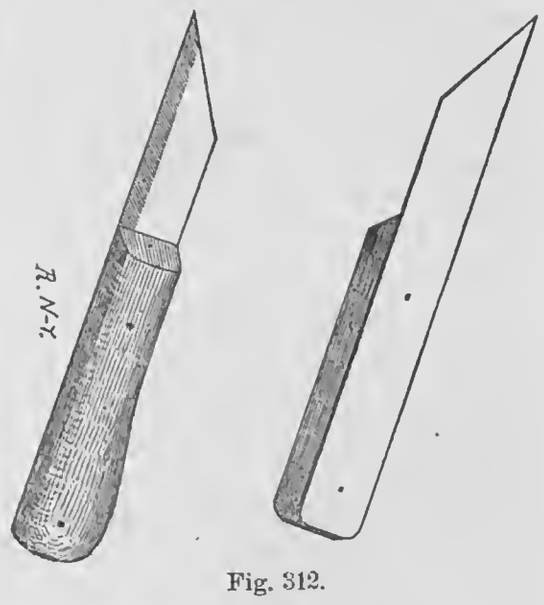

Fig. 312.

inches, and cut one corner away so as to make the point shown in the picture. Make two holes, one one-half inch and the other three inches from the handle end. For handle take a piece of hard wood—hickory, ash or iron-wood—one-half inch thick, three-fourths of an inch wide and four inches long, and fasten on with screws or rivets. This knife is much handier for paring than one having the handle on both sides of the blade.

What Others Say.

Wood Litter vs. Straw for Bedding.—B. E. Fernow, in a paper read before the American Forestry Congress, calls the attention of farmers to the value of what is known as lumberman's waste, which includes not only sawdust, but edgings, shavings, brushwood and other wood litter, for bedding and manurial purposes.

It is claimed in this paper according to the N. Y. World—we have not seen the paper—that wood litter makes a better and cleaner bedding for cattle than does straw; that the cleaning of cows requires only about one-fourth the time that it does when straw is used, for the liquids are at once absorbed and the dry excrements are quickly enveloped with wood fiber, preventing the soiling of cattle. The removing of the bedding requires less time and the air of the stable is less damp and kept purer in consequence of the total absorption of all moisture and the slower decomposition of the urine, which, especially in horse stables, where ammonia is quickly formed, seems to be of importance, and a guard against sore eyes and other diseases.

Mr. Fernow gives the assurance that the manure from wood litter is better than from straw because it binds the liquid excrements better and retards the decomposition and loss of valuable plant food, especially the nitrogenous compounds. The mechanical effect on the soil he believes to be in no way inferior to that of straw manure. That humification of wood manure goes on more slowly he does not deny, but he thinks this may even prove an additional benefit when the process of decomposition takes place in the soil instead of in the manure heap, and the soil profits from the heat due to the chemical action and retains the ammonia developed.

M. Pasteur's New Quarters.—A most extraordinary museum has just been opened in the Rue Vauquelin, of Paris, says the London Farmers' Gazette. It is difficult to say whether it should best be called a museum, or a factory, or a farm, or a menagerie. It is in fact all four combined and grouped together for a purpose hitherto untried, and presenting an appearance hitherto unparalleled. These are the new head-quarters of M. Pasteur, and here are to be found cow-houses, sheep-folds, fowl-walks, rabbit-hutches, and dog-kennels. They are all, moreover, fully occupied. On one side is a laboratory, where the vaccine soups and preparations are made up. Above it a museum, where specimens connected with the new cure are exhibited. There are operating rooms and rooms for post-mortem investi

gations and dissecting purposes. Two of the kennels are devoted to dogs in various interesting stages of early or advanced rabies. "Hen cholera" is communicated, watched, and cured in the fowl house. The cattle exhibit various stages of vaccination. Human beings have also their provided quarter. A spacious waiting-room is set apart for patients, who troop in daily in picturesque groups—according to the French press—representing all nationalities. In the meantime the great *savant* occupies the former quarters of the Pasteur Institute in the Rue d'Ulm, and devotes himself in dignified seclusion to scientific research.

How to Sell.—It is estimated that about one-half of those who sell farm produce get an average of 10 per cent. less for their goods than they otherwise would owing to inattention in selling. The National Stockman discussing this subject, says a great many people sell their grain and their live stock and their hay and their wool for a little less than they could if the matter of selling were more thoroughly studied; but the greater losses come in the handling of what are usually considered the lesser farm products. The time of selling is a most important consideration, and in the products enumerated is perhaps as great as any other; but in these the manner of putting up, shipping and placing in the hands of the consumer is of no less consequence, while in the lesser products these may be said to be almost everything. In butter and eggs and poultry and fruit and vegetables, nearly all of which must be sold when ready, a proper observance of all these things means a difference of from one-third to one-half in the prices obtained. Here are some questions which the farmer should answer: (1) In what form will my product best please the consumer? (2) How can I get it to him in the freshest and best condition? (3) How can I lessen the expense of transportation between us? (4) How can I most directly reach him without the intervention of too many others to share my profits? (5) How can I best become known myself as a prompt and careful shipper of a choice article of my own production? (6) What does my market most need that I can furnish it, and where can I find the best market for all I have to sell?

Good Health in Mating Stallion and Mare.—In breeding horses, and indeed other animals also, many failures may undoubtedly be attributed to ill-health of sire or dam at the time of coupling. A recent author on horses says: "We must begin by pointing out an old and commonly practiced act of negligence, which not only every veterinary surgeon, but every medical man, and all students of animal constitution, would concur in decrying, namely, the want of proper attention to the actual state of health of horse and mare at the time of mating. It seems never to strike breeders that before allowing a mare to be served they should at least take the trouble to ascertain if the horse is in good health; for it cannot be taken for granted that because when robust and in strong exercise a stallion has fathered an Eclipse or a St. Simon he will be capable of begetting similar stock when ill and uncared for."

A writer in the London Live Stock Journal says he believes it is essentially necessary to have stock in perfect health for breeding, and no matter how well you may have mated your mares, if they are out of health or badly fed on inferior diet, you cannot expect to get a well-developed fœtus that will grow into a good muscular horse.

Hurrah for Us! In a recent work by Andrew Carnegie, of Pittsburgh, a Scotchman by birth, and now an American manufacturer, the author gives many interesting facts showing the progress and prosperity of his adopted country. He states that during last year 74,000 more tons of Bessemer steel were produced in the United States than in Great Britain; that more yards of carpet are made in Philadelphia and the vicinity than in all England, Wales and Scotland; that the school libraries alone in this country contain 12,000,000 more books than all the public libraries of Europe combined; and that all the State and City debts of the Union added together, rating them according to valuation of property, do not amount to one-fifth of the city debt of Manchester, Eng., or one-tenth of the debt of Birmingham.

Public Official Seed Testing.—The French Government has opened a most valuable office in Paris, and the idea might well be adopted in this country. This office is for testing the quality of all seeds as to purity, soundness, vegetative power and freedom from weed seeds. If we had such officers, under proper control and backed by governmental authority, where for a fee of a few cents a farmer could have a legal test and a guaranty for his seeds, it would be a long step in advance. Why shouldn't we have such officers? Seedsmen might kick, but the public would be greatly benefited.

The Cows that Pay.—If a whole herd of say 20 cows will average 10,000 pounds of milk without weeding out or testing individual cows, then in all probability at least 10 of them yield 6,000 pounds, and perhaps the other 10 only 4,000 pounds each. In such a case it is easy to see, says the National Stockman, that the best 10 cows pay a liberal profit, but half of this is lost in making up the deficiency of the other 10. It is good practice to weigh the milk of each cow once a week for the season, and then weed out those that do not come up to a profitable yield.

BY THE SHORT WAY.

Prepare the land for wheat as early as practicable.....

Go over the field and sweet corn and cut out the plants where too thick for the cattle. This will help the corn crop as well as the cattle.....

Try buhach or Persian Insect Powder for the cabbage worm. Wet a tablespoonful of powder with alcohol—stir this in a pailful of water.....

Prepare the plots for strawberry plants. Cut out the old canes of raspberries.....

Thin out the beets, clear up the pea haulm and plant late cabbages or celery plants.....

Nip off the tops of Lima bean vines . . . Care for the tomatoes. If in the garden, three stakes to each plant with two cords around make a firm support. It is better to stake them now than to leave the plants to sprawl over the ground, unless the supply promises to be greater than the demand. As a matter of profit, it does not pay to stake tomatoes.....

It will pay farmers at this time to kill every potato-beetle and grub. The second brood of beetles is now appearing.....

Look to the branches of pear, apple and peach trees. If thinning the fruit is not desired, see that supports are provided to prevent the branches from breaking.....

We can never rid our gardens of purslane by merely hoeing up the old plants. They mature millions of seeds, which will germinate even when green. Either destroy the young plants, or prevent the seeds from growing by frequently stirring the soil.....

Carefully *cut* off the pickles when of the desired size. *Pulling* or twisting them off injures the vines.....

If the soil is dry, the early matured potatoes may remain in the hills, but if wet, they had better be dug and stored, or rot will surely ensue.....

It is now a good time to layer such plants as do not freely root from cuttings. We have sent hundreds of cuttings of the Victoria Grapes to friends, and many have reported that they did not "strike." It is the same with many other varieties of grape-vines. The lower strong shoots may now be easily bent into the soil and held there until well rooted.....

Henry Stewart's flock of sheep on his North Carolina farm has recently been damaged to a considerable extent by hounds, which were permitted to go at large, wandering abroad day and night and trespassing where they will. And yet there were four bell sheep in the flock. Those persons who write so fluently, but so falsely, that dogs will not attack a flock in which a few bells are distributed mislead their readers and do mischief. Bells are no safeguard whatever....

An Ohio onion planter says that he sowed half an acre to onions a few years ago. They came up splendidly, but soon the maggot commenced to prey on them, and continued to do so until he became discouraged, and he thought if they continued to eat one week longer his prospect for a crop of onions would be ruined. He sent and got five gallons of tar and put one gallon into 40 gallons of water, and stirred it up thoroughly so as to give it the tar scent. He sprinkled his onions over once with this tar water, doing it with a common watering pot. He saw no more effects of the maggots, and had a nice yield of onions. He thinks that the scent of the tar water drives the fly away, and it was by this means that he saved his crop of onions.....

Farmers will now be thinking of stowing eggs away for Christmas, says a writer in the London Farmers' Gazette. Some have already done so. Generally in this month, when hens are laying well, he begins to place a few away in small earthenware vessels. The simple plan adopted is adding 1¼ pound of salt to a gallon of water. Boil this 20 minutes, and add two or three spoonfuls of quicklime. When cold, place the eggs in the liquid. He finds them to keep excellent to taste and like new-laid eggs for six months. This is, he is sure, worth a trial.....

The hides of over 1,000 horses are used annually in New York for covering base-balls. From one hide, it is said, the covering for 12 dozen balls can be cut.....

"The New York Tribune has reduced its agricultural department to four columns" says the Rural New-Yorker. "It ought to be added," says Mr. Stiles of the Philadelphia Press, "that this reduction is only temporary. Mr. Crandell, the agricultural editor, who has never before taken a vacation, is now enjoying a little well-earned rest. When longer evenings and the season of lighter work give farmers more time for reading, Mr. Crandell, with regained health, let us hope, will fill his pages as he has done with such success for many years."

We are mighty glad to hear it, though Mr. Crandell did not mention anything of the kind in a late call. We did not suppose he could bring himself under any circumstances whatever to lighten his load even for a week. The farm departments of the Press and Tribune are turned to and read by the writer of this note with more alacrity than are the columns of the average agricultural paper, and we don't like to see them tampered with by the editors-in-chief.....

A correspondent of Puck says that a milkweed is the proper thing to plant on a milkman's grave. Puck suggests that a water lily is more appropriate.....

There are 150,000 milch cows in New Jersey, according to the 10th census of the United States, requiring annually about eight million dollars' worth of food, a large enough sum to justify the consideration of methods in feeding them and to warrant the examination of the kind and quality of feeding stuffs offered for sale in the State.....

Mr. J. M. White, of New Jersey, says that observation leads to the belief that many cultivators do not rightly discriminate between the "yellows" and the effects of the borer, and many times attribute the effects of the one to the other.....

It may be a pretty big job to keep the flies out of the stables entirely, but it ought to be done if possible. The annoyance from flies while in the stable is often harder on the horses than hard work in the field.....

India is shipping wheat to Australia: 50 tons left Calcutta for Adelaide the other day in one shipment.....

The House of Assembly at Melbourne has introduced a bill providing for a system of irrigation, embracing an area of 3,250,000 acres. The system is expected to prove of immense benefit to farming interests in the colony of Victoria.....

Last year New Zealand exported 24,923 cwt. of butter at about 18 cents a pound; in 1884, the exports were 15,205 cwt. at a little higher price. She sent abroad also, in 1885, 10,353 cwt. of cheese averaging about 10 cents per pound.....

In England "new milk" is being regularly sold at many railway stations. Boys take it round to the passengers in cans made for the purpose, and sell it at four cents per half-pint glass.....

For the last six years or more there has not been published an issue of any English agricultural paper—so far as we can remember—which does not contain at least one article on "Agricultural Depression."

An expensive "Guide Book to the Dominion" and immigration pamphlet just issued from Ottawa, Can., contains the following valuable agricultural information: "Seed time continues, according to the season, from the last week in April until early in May." The British farmer, for whom the work is particularly intended, will be apt to consider this a rather short seeding time.....

The Del Rio Dot is edited by a young lady She remarks: "Man proposes; but it sometimes takes a great deal of encouragement to get him to do so."

Everywhere.

TRANSCONTINENTAL LETTERS.—LVI.

MARY WAGER-FISHER.

A citrus fair; citrus growing in Northern California; hardiness of orange trees; the northern citrus belt; lemons and other fruits; licorice growth; seedling oranges and lemons.

All the way down through the Sacramento Valley we were surprised to see so many orange trees in fruit, as it had not occurred to us to see citrus fruits north of San Francisco. So when in January the announcement was made that Northern California would hold a citrus fair in Sacramento I was eager to see it. But a San Francisco gentleman said to me: "Oh, if you want to see citrus fruits, wait until March and go to Los Angeles and Riverside. They can't raise these fruits to any amount in Northern California." So I gave up going to the fair, but the fair, after "electrifying" Sacramento, was accommodating enough to come down to San Francisco, where, of course, I went to see it, and San Francisco in turn was "electrified." Southern California was quite up in arms that the northern and central counties of the State—Shasta, Sacramento, Butte, Yuba, Placer, Tehama, Yolo, Sonoma, Calaveras, Amador, Napa, Colusa, Sutter, Solano, Navada, Tulare, Lake, Santa Clara, El Dorado and San Joaquin—should presume to raise citrus fruits of splendid appearance and excellent quality. The fair was a popular exhibit, very hurriedly conceived and executed, but in every way a perfect success so far as the exhibits were concerned. Although oranges have been growing in a haphazard way—seedlings mostly—in Northern California for 20 years, it is but very recently that the people seemed awake to the fact that they might be raised to great commercial profit, as well as for ornament and home use.

The citrus belt extends from the base of Mt. Shasta to the San Joaquin Valley, extending to the eastward up into the foot-hills to a hight of one to two thousand feet, and has an area of about 40,000 square miles. Orange trees are hardier than lemons, and they are so hardy that they grow in some counties where the snow lies in their branches for five weeks in Winter. Indeed, the extent to which the tree may be rendered hardy, has probably yet to be thoroughly tested. The summer heat is great in the Sacramento Valley, the trees have to be irrigated, and the fruit is ripe early in December, so as to supply the market at Christmas time. Placards were up all around in the Exhibition Hall, to inform the public that land in the citrus belt could be had from $10 to $50 per acre.

After looking over the exhibit very carefully, I thought that the finest display of oranges was made by Placer County, although Sacramento and Butte were not far behind. One party in New Castle (Placer Co.) has an orange grove of 200 trees; another party one of 250 trees, from which 18,000 oranges were picked this season, up to January 2. The shipments of oranges from New Castle amounted to 53,378. St. Michael, Mandarin, Navel (a seedless orange and very large) and Mediterranean Sweets. In addition to oranges, the exhibits from this county included lemons in variety, very large and fine olives, olive oil, almonds, figs, dates, pumalos (a pear-shaped shaddock), chestnuts, walnuts, Japanese tea, tea seed, and January roses. Sacramento County sent soft and hard-shell almonds, walnuts, Japanese persimmons (they grow beautifully in Alameda Co.), a large variety of oranges and lemons, olives, olive oil and licorice root. The licorice root was grown six or eight miles from Sacramento City, and the grower told me that it grew like Alfalfa, with a very long tap root from 10 to 20 feet deep in the ground. The lateral roots are preferred by druggists, who sell it dry at one dollar a pound, and buy it of the grower, dried, at 14 cents. The top, he said, looked like a young locust tree. This same man had a fine exhibit of olives, fresh, in pickle, and olive oil. The ripe fruit is dark like plums, and the leaf of the tree resembles that of the willow. I do not care for olives, except the oil: the ripe fruit is disagreeable to my taste—very. Before the olives are pickled they are treated to a bath of lye, which leaves them a light green, when they are put in salt and water—a little salt. The exhibitor declared that one could live well on olives and dry bread and have no need of animal food, and that they are a sure cure for dyspepsia. The olive tree lives and bears fruit forever, or "next to it."

Yuba County sent very fine lemons, and one lady, from Marysville, sent 1,500 oranges and 1,000 lemons. There were lemons on trees—cut trees—trees two years from the graft, trees 12 feet high. This lady—Mrs. Karr—had 400 orange and 100 lemon trees. From this county come also pomegranates, almonds, persimmons, foliage of India-Rubber tree, olives, limes, and branches of loquat in bloom—a tropical fruit which ripens in July, and upon which the frost has no effect here.

Butte County sent from Oroville lemons, oranges, almonds, pumaloes, olives, persimmons, limes, bamboo, pomegranates, figs, plums, apples, and walnuts. From other towns came California black walnuts, resembling the English, but with smoother shell (native to the State), Eastern chestnuts, Italian chestnuts, pecans, hard and paper-shell almonds (almond is seed of a fruit that looks like a furzy peach), English and black walnuts, oranges, almonds, and walnuts from an altitude of 1,000 feet, and a lady sent oranges picked while three inches of snow were on the ground. A lady from Shasta sent oranges grown at an altitude of 1,150 feet. From Redding (Shasta Co.) came a very good exhibit of cotton grown without cultivation, and cotton can undoubtedly be raised in California as well as tea.

Some 18 varieties of oranges were on exhi-

bition, bnt the majority were seedling fruits, and it was the universal verdict of exhibitors that the seedling fruit is the best, the trees the longest lived, and the fruit improves as the tree grows older. A seedling lemon at Oroville, 17 years old, bore 1,200 this season. From Colusa and various other counties came superb raisins, muscallox and seedless sultana. Woodland, Yolo County displayed specimens of grape-vines three years old, which yielded a ton of raisins per acre. An orange tree, 30 years old, yielded 4,000 oranges this season, at Marysville.

A gentleman from Oroville told me the greatest cold ever known at Oroville occurred three years ago—the mercury falling to 20° below the freezing point. Orange trees at Oroville make a growth of from six to eight feet in a year, and sometimes bear at six years from the seed. At the time of the severe cold the orange trees were not injured; the lemon trees lost their leaves and did not bear fruit the succeeding year. On the Oroville counter were also photographs of orange groves at Christmas time—looking like a mid-summer scene in Peunsylvania. Pomegranates are liked by Mexicans and Spaniards—and not much by Americans. The Japanese persimmons are very ornamental, and the fruit here has an extraordinary keeping quality. A New Castle lady sold 10,000 oranges at Christmas time at two cents apiece. A Tehama County man has an orange grove of 200 bearing trees, 10 years old—trees thrifty, and fruit fine. Indeed if anyone asks:

"Knowest thou the land where the lemon trees bloom,
Where the gold orange glows in the deep thicket's gloom,
Where a wind ever soft from the blue Heaven blows,
And the groves are of laurel and myrtle and rose?

he may be truthfully answered that it is in California, from end to end, a strip between the mountains and the sea. But as to oranges, I would "trade" my orange every time for a genuine Eastern apple of New England flavor.

RURAL SPECIAL REPORTS.

Alaska.

FORT WRANGEL, July 10.—Crops of all kinds are two or three weeks later than usual. Oats and barley are just heading out and promise well. No wheat that I know of is grown in Alaska this year, though I raised good Spring wheat last year. Early potatoes, rutabagas, carrots and beets are doing well, but they are late. Cabbages and cauliflowers promise first-rate. Hay—Timothy and native Red-top—very heavy; just commenced harvesting the latter. We have had more rain than usual in this wet country. Cattle do well, and there ought to be thousands of them here. We have only to feed from three to four months in Winter. J. W. Y.

Dakota.

MITCHELL, Davison Co., July 15.—We have had a peculiar season for Dakota. Up to May we had three or four times the usual rainfall for the spring months, but since then we have had scarcely any. In June we had less than an inch and a half: in July so far not over a quarter of an inch. These are our wet months generally. Wheat and oats are making a brave effort, however, and will be from half to a full crop. Corn never looked better, barring a few localities; but unless we get rain it would seem it could not make a crop. Potatoes are nearly a failure; shipping stock will be small, and crop light. Flax is the worst, the moisture not being sufficient to sprout the seed and start it, especially the late seeding. There are opportunities here for persons of moderate means to secure farms, though government land is all occupied. W. H. S.

Illinois.

CHAMPAIGN, Champaign Co., July 23.—The grape crop this year in Central Illinois is a very remarkably good one, and so of almost every other kind of fruit, small and large. No rust, no blight, no mildew, no fungus, no insects, and one thing remarkable, only a few birds. B. F. J.

Michigan.

MENOMINEE, Menominee Co., July 17.—We have had a long and severe dronght with great heat, so that everything has suffered, and many vegetables are literally burned up. W. G. B.

New York.

STOCKTON, Chaut. Co. July 26.—Farmers are mostly through haying. The crop promises to be an average one. Pastures are very short on account of the dry weather, and cows are shrinking badly. Corn is looking well; most fields are tasseled out. Oats promise an average crop. Potatoes need rain; early ones about two-thirds of a crop; bugs plenty. But little wheat is raised around here. What there is looks well. Creamery butter averages 18 cents per pound; home dairy, 14 cents; cheese, from 7 to 8 cents. The Alaska Peas, planted the first of May, were large enough to eat the 11th of June. They are the earliest peas I ever raised. Compared with 11 other varieties of field corn, the Angel of Midnight was the fourth to tassel out, the Early Canada, Longfellow and Shaker's White Flint being ahead of it. F. M. V.

Pennsylvania.

ANNVILLE, Lebanon Co., July 24.—Spring was somewhat later than usual. Crops in consequence were put out late. but as we had abundance of rain and sunshine, they are better than usual. Hay was a very fair crop. Wheat, the very heaviest we had for years, and of good quality and housed in good condition. Some damage was done in some localities by the army-worm, which is on the increase. Oats, too, are an unusually heavy crop, although not yet housed. Potatoes a very fair crop. Paris-green was used judiciously in fighting the Colorado beetle, which turned out in greater force than ever. Apples are a very fair crop. Small fruits of all kinds, except pears (?), are generally quite plentiful. Pasture is all that could be desired, so that stock are doing well. Market prices for all kinds of grain and produce are low: New wheat, good, 75 cents per bushel; potatoes, 50 to 60 cents; other things in proportion. J. A. B.

Wisconsin.

REEVE, Langlade Co., July 17th.—Corn not much grown in this section. I raise some each year for my milch cows, and like it better than hay. Wheat not much grown, as there are no mills for flouring it, but it produces well and will be quite extensively grown. Oats, rye, barley and potatoes look well—as good as, or better than last year. Hay about half a crop. Rural Treasures look fine. The Alaska Pea is 10 days or two weeks earlier than Carter's Stratagem. I planted it May 5, and had peas for dinner July 8, and would have had them on the 5th, but saved the earliest for seed. They will grow in 60 days. F. F. L.

Wyoming Territory.

CHEYENNE, Laramie Co., July 24.—Reports from various sections of Wyoming Territory indicate that an unusually dry season has followed a snowless Winter. Up to July bnt little rain had fallen in any part of Wyoming. During the last two weeks there have been many cloud-bursts and copious rains in the eastern part of the Territory, filling streams bank-high. Thus far the Summer has been the average Wyoming Summer. As a whole, the Territory has not suffered from drought, while some portions of Central and Northern Wyoming have. The grass is fair, and has cured now, promising winter grazing where the country is not overstocked. Wyoming, from the line of the Union Pacific to the Montana boundry, is fully stocked, and cannot feed more cattle than are already within her borders. Importations of half-starved Texas cattle, such as have recently been brought to this Territory, are sure to suffer for want of sufficient food and water. The losses among that class of cattle must be very great, under the most favorable circumstances, next Winter. Cattlemen returning from a thousand-mile ride over the cattle ranges of Northern and Central Wyoming report beef cattle as rapidly improving, though somewhat later than usual. The calf crop is above the average. The hay crop is small, but of first-class quality. All agree that, while the season has been unusually dry, the grass is good in Southern and Eastern Wyoming, bnt the drought is affecting the large grazing fields in Johnson, Fremont, and Crook Counties.

Ranchmen and new settlers who immigrated to Wyoming this year intending to cultivate the soil, have suffered greatly from the drought. Their attempts to raise crops have generally proved failures, owing to the scarcity of water for irrigation purposes. This, however, does not affect Wyoming as a whole, as the energies and capital of the people are principally devoted to stock raising. L. H. T.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

MANAGEMENT OF THE TOBACCO CROP.

W. M. F., Belleville, Texas.—When should the tobacco plant be cut, and how can one tell by the appearance of the plant when it should be done? How is tobacco cured?

ANSWERED BY H. STEWART (NORTH CAROLINA).

This question brings up the whole intricate business of cutting and curing tobacco, and the answer depends largely upon the kind of tobacco grown, and the experience of the grower. In general, the managament of the crop is as follows: As the plant nears its full growth, suckers start from the axils of the leaves, and these suckers are pinched off as soon as they appear, lest they might interfere with the growth and ripening of the leaves. The blossom buds are also pinched off and the upward growth of the plant is stopped in this way at 6, 8, 10, 12 or 14 leaves, as the variety may vary or the fancy of the grower may dictate. In North Carolina where the yellow-leaf tobacco is grown all aloug the mountain region and foot-hill country, from six to ten leaves are left on the plant. In Kentucky and Virginia, where the dark tobacco is grown, from 10 to 14 leaves are left In Texas "a happy mean" would be 10 leaves, and when the fifth pair of leaves are about two inches long, the tip of the stalk is pinched off. Then the plants are watched to save them from the worms, the large green-striped larvæ of a sphinx moth, which are otherwise known as the tomato worms. The plant is meanwhile slowly maturing, and as it ripens, the leaves begin to turn yellow. It is then ready to cut. It is cut as follows: the stem at the lower part, for about 10 inches, is slit with a sharp knife, beginning about the stalks of the lowest leaves, and leaving about three inches of stem below the cut. The plants are strung upon a lath four feet long, one after another, by means of this slit, which is also made to help to dry the plant. When the lath is full of plants, so placed that they do not touch, it is hung in a rack on a wagon, and when the rack is filled, the load is taken to the tobacco house where the laths are ranged on beams placed lengthwise of the house so that as many plants can be hung in it as possible without touching. The lowest tier of beams is about eight feet above the floor, so that a man can move about easily under the plants.

The curing is now done by means of flues arranged as shown at Fig. 314. The O O

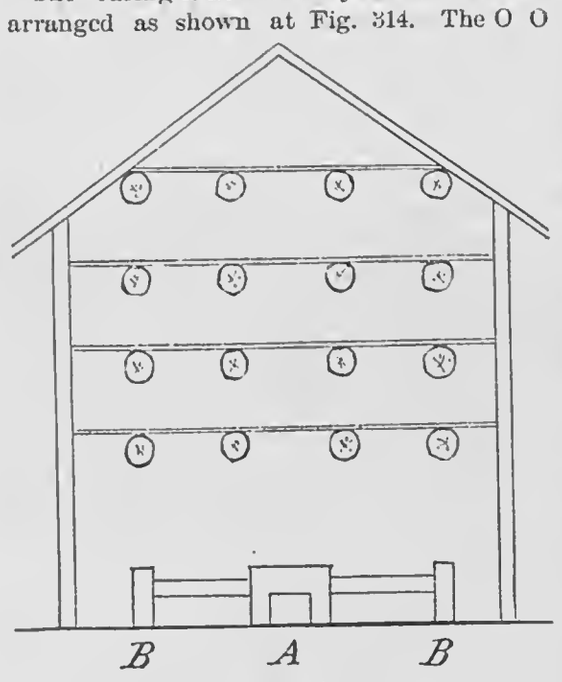

Fig. 314.

represent the beams, and the horizontal lines are the laths upon which the tobacco plants are hung. At A is a furnace having hot air-pipes leading from it to side flues, B B, and a central flue, all leading to the chimney or outlet at the back of the barn. Fig. O shows the arrangement of the tobacco, and the flues so placed as to supply the requisite heat in an even manner all through the barn. Fig. 315 shows the plan of the flues. At Figs 316-317

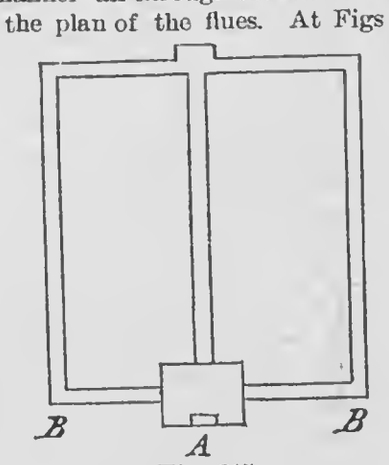

Fig. 315.

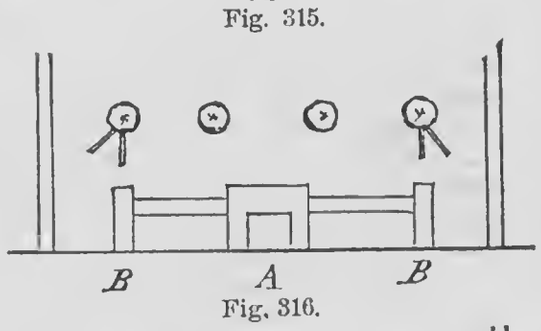

Fig. 316.

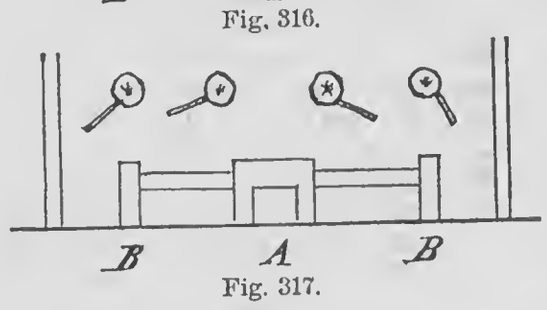

Fig. 317.

is an arrangement of guides to distribute the heat, which is my own invention (not patented and free for any person's use.) These guides are boards of sufficient width, which are hung to the lower beams so that by drawing on guiding cords fastened to the adjoining beams they can be deflected in such a way as to close partly or wholly any of the spaces and direct the warm dry current to any part of the barn. In case the tobacco at the center is drying and curing faster than the rest, the heat can be shut from it and turned to the sides. This arrangement was found exceedingly useful last season when it was first used.

The curing goes on slowly; the heat is raised at first to 80 degrees; then gradually to 100 degrees until the tobacco is nearly dry and of a yellow color, as desired. As soon as this appears, the heat is raised to 120 degrees, or 140 degrees to finish the curing quickly and fix the color. This is where the experience of the operator comes in, and no one can give exact rules for any one case because success depends upon many accidental conditions. After curing one crop one will know how to manage a second. After the tobacco is cured, it must come "in case" by which is meant it must be left to absorb sufficient moistnre from the air to sweat and become soft and pliable. It is then stripped from the stalk: put in hands and tied and bulked, or put in piles and weighted, when it undergoes a fermentation or sweating by which the flavor is brought out by some chemical change in the gum and other parts of the leaf. This is also one of the technical parts of the curing which can be learned only by experience. And at every point in all this intricate curing of the leaf the operator runs the risk of damage or destruction of his crop by some blunder or carelessness which ruins the whole bnsiness.

FRUIT QUERIES.

H. W., Wheeling, West Va.—1. Will it pay to plant an apple orchard on farm land worth from $80 to $100 per acre? 2. If so, what varieties shall I plant from earliest to latest? 3. What grape will make as good wine as Catawba, and ripen a week or 10 days earlier? 4. At what age does the Transcendent crab begin to bear?

ANS.—1. Where apples do well, and are treated with care, an orchard will pay extremely well on such land—better than almost anything else. 2. For market, no one should plant a large number of varieties, and as a rule extremely early apples do not pay, except one has a local market that will take them. We might give a list, but the best way is to look about in the immediate vicinity and see what apples succeed the best and are most in demand for market. There is such a variation in soil and climate even in a single county, that no one can tell as well as the man on the spot. For instance, on our farm, and not 100 rods apart, we have two plum orchards. One does extremely well and bears large crops; the other is worthless and the trees are dying out. The difference must be in the soils, and yet an expert could not tell the difference except by trial. 3. The Delaware makes a fine wine—as fine as that from the Catawba, and it is more than 10 days earlier than that. The Niagara is said by those who have tried it, to make a superior wine, and that is early. 4. We have seen the Transcendent bearing in the nursery rows, and it usually bears when not planted more than two or three years, and gradually increases its crop as it gets older.

BITTER MILK.

Subscriber, Leeds, Mass.—Three of my cows give bitter milk, and the cream from it won't yield butter when churned; what is the cause?

ANS.—Some cows—now and then one—will give bitter milk when well advanced in pregnancy. It would be singular to have three thus affected, and it may be only one, and the milk being mixed together, the whole mass is affected. Each cow's milk should be set separately to determine this matter, and if all are alike, then the trouble must be with the pasture or the water. Foul weeds would affect the milk, and so would bad water. In a dry time all water in small ponds or pools becomes more or less foul. Only running water or water drawn fresh from wells is good for cows giving milk. There is evidently some active principle of decomposition in the milk which works rapidly after it is taken from the udder. The water should be looked after first, and then the pasture should be changed if no other remedy is discovered. Most weeds are not unhealthy, but some, quite common, are very injurious, and affect the stomach and the blood. Rag Weed, St. John's Wort, lobelia, etc., are generally found in old pastures, and are injurious.

CRUDE PETROLEUM FOR SCAB IN SHEEP.

F. H. S., Reiley, O.—Will Mr. Woodward be a little more explicit in stating how he uses crude petroleum for the scab in sheep; what kind he uses and how much it takes to treat 100 sheep?

ANS.—The light green oil, like the Pennsylvania oil, should be got, and not the heavy West Va. lubricating oil, and the quantity

will depend much on how badly the sheep are infested. It needs no preparation at all, and can be applied from a can like an old-fashioned lamp filler, or by a swab made of soft cloth tied on to the end of a stick, or with a soft stiff brush, like a stencil brush, or a well worn paint brush. It makes but little difference how it is applied provided that plenty is put on, and that by some means the scabs, with which the sores are usually covered, are well broken up, so that the petroleum can reach and penetrate into every part of the sore. This it is sure to do, and to kill every scab insect if it only has a chance. It is also far superior to spirits of turpentine as an application to any sore on any animal, that through neglect has been attacked by the flies and become filled with maggots. Plenty can be put on, as it does no harm, and should not cost more than from 10 to 20 cents per gallon anywhere, as it is not worth more than $1.60 per barrel at the works, including the barrel, which contains 45 gallons.

ALSIKE.

P. R., Stroudsburg, Pa.—1. Would you recommend Alsike Clover as a hay-producing plant for meadows? 2. If so, how much seed per acre, and how should it be sown?

ANS.—1. Alsike Clover, when grown alone, makes, even on heavy, rich, moist soils (the soils best suited for its growth), only a moderate quantity (say a ton or less per acre) of only fair hay. It "looks big" when growing; but it is found to be very light when cut and cured, and we cannot, after much experience, recommend it for sowing alone, except when desired to produce seeds. It is very valuable for mixing with other seeds when seeding down the lands. Used in this way it fills in the bottom very nicely and stands wet and cold much better than other clovers; it fills up any spots from which they may be killed out, and in these ways it adds several tons to an ordinary meadow in the yield of hay. It should be sown in Spring, and if designed for growing a crop of seed, it should be sown alone, or with Timothy, using six or eight pounds per acre; but for other purposes it should be mixed with the other "grass seeds." Prepare as for ordinary seeding and then add two pounds of Alsike seed for each acre.

WHITE CLOVER AND BLUE GRASS PASTURE.

C. H. C., Chicago, Ill.—On a high rolling prairie pasture White Clover came in this Spring nearly as thickly as Blue Grass: 1. will the Blue Grass kill the clover—or *vice versa?* 2. Is the feeding capacity of the pasture lessened by the presence of the clover instead of Blue Grass? 3. Would it be worth the outlay to get rid of the White Clover—there's only a patch on a quarter section?

ANS.—The pasture is all the better for having the mixture of White Clover and Blue Grass. It should be let alone to remain as long as possible, so as to afford a greater variety of nutriment. Each is among the best. In time the Blue Grass will crowd out the White Clover. All Blue Grass might make a little more food as it grows early and late; but the clover will fill the ground until the Blue Grass has time to spread all over, and come to its full root, just as Eastern farmers sow clover with Orchard Grass and Timothy to fill up till the others mature.

GETTING RID OF OX-EYE DAISY.

A. L. S., Princetown, Ind.—How can I get rid of the Ox-eye Daisy, seeds of which were sent me mixed with Orchard Grass by an Eastern seedsman?

ANS.—It is a perennial hardy plant. In this case it seems to us that it would pay to carefully pull the plants up as well as to destroy the seeds. If the seeds have not matured, it will be very easy to destroy the plants, if the field be put in corn or other crop that can be cultivated. Ox-eye Daisy is to be avoided beyond question. Yet when cut early it makes a good hay.

Miscellaneous.

S. A., Mansfield, Ohio.—The specimens of the plant sent for name had no good leaves, and the flowers were abortive or rudimentary. The plant is some species of medicago—either M. maculata (Spotted Medick) or M. lupulina (Black Medick or Nonesuch). This genus includes Alfalfa and many others. The flowers of this are very small, and probably would never have grown larger. The development had been arrested from some cause. In cauliflower the branches are changed and the flowers abortive. The medicago is a case very similar to that of cauliflower, only in the former the flower stems are still slender. The whole matter of monstrosities has been admirably written up in "Vegetable Teratology," by Maxwell T. Masters, and published by the Royal Society, 1869.

"*W.," Greeley, Colo.*—How long will Alfalfa seed keep good? 2. What is the best kind of squash for stock? 3. What is the proper time to castrate a colt—age and season? 4. Which is the better to use for crossing for quantity of butter—a Jersey or Holstein-Friesian?

ANS.—1. Alfalfa seed will undoubtedly grow when several years old, if it has been kept dry. When allowed to get damp, to heat and become moldy, it will not grow—the same as other seeds. We once sowed ten-year-old turnip seed, and it grew well. 2. Hubbard Squashes will produce the most food elements, but they are too hard for stock. The large Yellow or Boston Marrow will give most bulk in a form stock can eat. 3. There is no general rule. If colts are lightly made forward, they are left till two or three years old. If well formed and precocious, it is best to castrate in cool weather when about one year old. They will do better and are less troublesome. Castration should not take place when there is danger of maggots; otherwise, any time, avoiding exposure to storms and extreme cold. 4. Jersey cows are almost always good cows for butter, while the H.-F. are noted for the quantity of milk they give. There are Holstein cows which have made excellent records as butter-makers, but the Jerseys are generally considered the best for a butter-dairy, and hence the best to cross with for obtaining quantity of butter.

W. G. B., Menominee, Mich.—I have quite a number of hardy apple trees of the Russian varieties, which appear to be dying. Many of the limbs of last year's growth which are loaded with fruit, are dead, and a good deal of this year's growth seems entirely dead. I have removed a good deal of fruit from those most heavily loaded. My soil is a light sandy sort. When I set them out I dug a large hole and put muck in the hole and have used muck instead of manure around them. They have grown very rapidly and have borne well as a general thing.

ANS. It seems to us the trees have been injured by the Winter, having made a late and rapid growth.

H. T. D., Dansville, N. Y.—1. Can I get roots of the Early Harvest? 2. Is the variety a good yielder? 3. What is the best red raspberry for market?

ANS.—1. Yes; of J. T. Lovett, Little Silver, N. J. 2. It is a good yielder of small berries of a peculiarly regular shape, with small seeds. It is the earliest blackberry we have tried, but not quite hardy. 3. The best late red raspberry for market is the Cuthbert. Hansell is as good as any for the earliest. Try the Marlboro, ripening between the two. It thrives well in many localities. The Rancocas is early and firm. The Fall catalogues will give the price of the Lucretia.

J. G. C., Millers, W. Va.—My two-year-old heifer continues to suck her mother, whenever she gets a chance. What can I do?

ANS.—Keep the cows apart as much as possible. If this is not possible, make a leather strap large enough to go around the heifer's nose, and fill it with sharp-pointed nails an inch and a half long. Fasten this strap to a halter, and put it on the heifer. The object is to make the cow refuse to stand. Heifers that have acquired this bad habit will frequently bother the other cattle exceedingly by chasing them about. If they are too troublesome, and cannot be kept by themselves, they had better be disposed of, as it is not probable that they can be permanently cured of the habit.

W. H. H. L., Harrisonburg, Va.—The disease affecting the grapes you send is the common rot. We should say that shade aggravated it in your case. We can suggest no remedy. Is the soil of the vineyard rich or poor? If the former, no further application of manure should be made; if the latter, we should try the effect of fertilizers in a small way. We should not destroy the vineyard until a further trial, unless it becomes apparent that too much shade was the cause.

A. D. S., Rockwood, Tenn.—The grass you sent for name is Panicum clandestinum, or Hidden Panic. We have often thought it would pay to raise it on low grounds which it prefers. It is perennial and highly relished by cattle and horses. One objection to its cultivation is that it is recumbent in its growth. If upright we should certainly have attempted its cultivation at the Rural Farm, where it grows luxuriantly on the lower lands.

H. H. L., Bainbridge, N. Y.—White Wyandottes are good hardy fowls, and belong to a general-purpose breed, such as the Plymouth Rock and the colored Wyandotte. They are not as hard to breed to feather as the latter, being solid white. They are not yet admitted into the "American Standard of Excellence" as a breed, but probably they will be soon.

W. H. S., Mitchell, Dak.—The grass sent for name is Panicum virgatum—Tall Panic Grass—Switch Grass. It is common on the sea coast, and also in the interior to the Rocky Mountains. It forms a constituent of the native grasses of the prairie, particularly in moist places. It is a good grass if cut when young, but harsh when ripe.

J. E. N., Minneapolis, Minn.—The package contains two grasses, Poa Serotina (Meadow Red-top or Fowl Meadow Grass) and Agrostis alba (White Bent, English Bent).

S. E. B., Amesbury, Mass.—The Marlboro is now offered by all nurserymen.

R. A., Thre Springs, Pa.—The plant sent is Cirsium arvense, or the Canada Thistle.

DISCUSSION.

S. E. PETTIMAN, DETROIT LINSEED OIL WORKS, DETROIT, MICH.—In the Farmers' Club, page 410, RURAL of June 20, J. T. asks, "Which is the better, all things considered, prices being equal, cotton seed meal or New Process linseed meal?" and the RURAL answers "Cotton Seed Meal." Now we claim that, "all things considered," new-process linseed meal is far superior in results, and in order to have the matter tested and accurately settled, we will supply for test feeding by some fair-minded, disinterested party, any required quantity without charge, the RURAL or any manufacturer of cotton-seed meal to furnish a like quantity of that also without charge: the report to be full, and the decision to be based on actual results, "all things considered."

R. N.-Y.—Our answer quoted above, and to which Mr. P. takes exception, was based almost wholly on the composition of the two feeds as shown by the average analyses, which are as follows:

	Cotton seed meal.	New Pocess linseed meal.
Water	8.33	10.12
Ash	7.25	5.93
Protein	42.06	32.94
Fiber	5.69	9.09
Carbo hydrates	23.43	38.35
Fat	13.24	3.57

It will be seen that cotton-seed meal contains 9. 12 per cent. more protein or flesh-forming elements, and 9.67 per cent. more fat, but 14.92 per cent. less carbohydrates; but the latter is much more than balanced by the greater value of the fat per cent, so that looking at the two feeds from a chemical stand-point only, our answer was correct. We must say, however, that in our own experience we greatly prefer the new-process linseed meal of which we feed from 25 to 30 tons each year. We regard either as a very cheap food at the prices for which they are sold, and we desire to feed them largely, but so far, we have been able to feed the cotton-seed meal in only very moderate quantities without producing ill effects upon the animals to which it is fed. We think this is greatly owing to the very large quantity of fat or free oil which it contains. In this respect it is much like the old-process linseed meal which with us has produced similar results, where fed in large quantities, viz. an injurious looseness of the bowels, and when fed to milch cows it has given a disagreeable, oily taste to the milk and also to the butter made therefrom. We think the offer made by Mr. Pettiman extremely fair, and we hope the manufacturers of cotton-seed meal will meet it, and that the two will be carefully and fully tested. We suggest that two or three of the Experiment Stations be selected, say Kansas, Missouri and New York, and that similar experiments be made at each, and that the results of each be published with all the data incident to the test. The trouble with us, or with any others of limited facilities, is that we have not the time or the appliances to give accurate results. We vote most emphatically for the trials.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING July 31, 1886.

Miscellaneous Advertising.

Sent on Trial.—A Double Gang "ACME" Pulverizing Harrow, Clod Crusher and Leveler will be sent to any responsible farmer in the United States, and if it does not suit he may send it back at the expense of the manufacturers. No pay is asked until tried on the farm. Farmers should not, therefore, let dealers palm off on them a base imitation or some inferior tool under the assurance that it is better. See advertisement on page 524.

SALT. ONONDAGA F. F. SALT. SOLE MANUFACTURERS. American Dairy Salt Co. (Limited.)
Chemically purified and WARRANTED pure as any in the market. Used by a great majority of the Dairymen of the country. Unexcelled for Butter, Cheese, the Table, and all Culinary purposes. Took Medal at Centennial "for purity and high degree of excellence." Dairy goods salted with it took first premiums at New Orlean's World's Fair, N. Y. International Fair; Milwaukee Exposition, and always wins when there is fair competition. It is American, and *cheaper and better* than any foreign salt. Try it. Address
J. W BARKER, *Secretary*, Syracuse, N. Y.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

100 Doses One Dollar

HAND PICKED SEED. **DIEHL-MEDITERRANEAN.**
The hardiest, best yielding and milling Wheat grown. Seed hand-picked and strictly pure. For sample heads and prices, address, with stamp,

No. 34 Park Row, New York.

SATURDAY, AUGUST 7, 1886.

The most vigorous watermelon vines about the Rural Grounds are those of the Mountain Sweet. The seeds planted were six years old.

This year we have seen quite a number of little gardens of flowers raised from the Rural's Garden Treasures. There seems to be no end to the varieties which are coming into bloom daily, affording a deal of pleasure and, to those so inclined, instruction

We have this year raised the Early Ohio among 70 different varieties of potatoes, some of which are claimed to be the earliest known. The vines of the Ohio died at least 10 days before any other. This is a grand potato where it succeeds, as the R. N.-Y. has often said, and it is a pity that it does not thrive everywhere.

All who desire advertising space in the Supplement to our next Special are asked to send in their copy before August 15th. The issue will be distributed by mail and otherwise from the coming September until May of 1887. The price per agate line will be 50 cents. The Supplement will be complete in itself, and be provided with a cover printed in colors.

The objection has often been raised to the level cultivation of potatoes that some of the tubers grow above ground and become greened and worthless. This objection is not well founded, according to our experience. Perhaps it is because we plant the seed in trenches deeper than others. A few days ago the writer went through a greater part of the potato field and failed to find a single exposed tuber.

It has been stated again and again that bagging grapes prevents rot; that the bagged grapes ripen earlier and ship better to distant markets, etc. Inexperienced writers do a lot of harm in making such statements. The R. N.-Y. was the first American paper to advocate the bagging of grapes; to illustrate how it was done and the best way to do it. We wrote from experience and tried to impress upon our readers that while the objects of bagging grapes were (1) to preserve the bloom, and (2) to protect them from birds and insects, the bags afforded little protection against rot or mildew; that the bagged grapes ripened later and would not endure long shipments so well as the unbagged.

A friend writes: "We are (righteously, of course) bucking against oleo in our legislatures, without even thinking how unready we and our farms are to supply the place of the bogus with the genuine article, while every pasture within 10 miles of a factory is growing up to brush. Our oleo-bills are worthless—like a dam of white beans in the Hudson—unless we back them with a determination to make honest butter plenty at any price at all. That would mean more grass and a far greater knowledge of it and all its differing habits, for the common people of the land. A collection of grass-recipes which would give seedsmen a sure profit, while the sowers would never know whether they are right or wrong, wouldn't amount to a huckleberry. That track—that blind leading of the blind—has led us too far out of the way already."

Many portions of Chinese soil are very poor indeed, and yet the country is one of the best-farmed in the world. For thousands of years it has supported a vast population. Two points of Chinese agriculture are worthy of note; no weeds are grown, and every available substance is turned into manure. It will be seen that in our "high farming" of the present day both of these points are considered fundamental. The best crops are grown on soil that is kept free from weeds by clean culture, and kept strong and hearty by liberal manuring. The good farmer will as soon think of leaving dirt on his face as to let his fields grow up to weeds, and the sight of a crop trying to grow without sufficient plant food, gives him a feeling akin to that he would experience in depriving his own family of proper food. The successful farmer falls in love with his farm and treats it reasonably. The well used soil is grateful.

In 1861, Congress passed an act granting a vast aggregate area of land to be sold to aid the cause of agricultural education. Land to the value of $10,000,000 has been sold from this tract, and buildings and apparatus valued at $7,000,000 have also been given. The people have the right to expect vast results from this outlay. There are some 40 agricultural institutions in this country reaping the benefit of the original land grant. About 85 per cent. of the students in agriculture are found in five of these 40 schools. The majority of the remaining 35 schools are so completely under the wing of a "State University" that they are likely to die in darkness. These schools should either be killed off or filled up with students. This sum of money is too large to be thrown away. A certain class of farmers have tried for years to kill the schools without much success. It is time they tried a better plan, and sent their boys to make these schools what they ought to be.

What do you propose doing towards securing a good teacher for your school this Winter? Make an effort this year to improve the school. Find out what teachers can be secured before you go to the school meeting. Talk things over with your neighbors, and see what they want. Put some good business man on the school board, and support him heartily in all needed reforms. Make the grounds attractive and the house comfortable, even if it does cost a little to do it. Visit the school as often as you can. Tell your children to mind the teacher, and never encourage them in rebellion. If you think the school is unfit for them to attend, take them out of it, and do not send them there to carry on an authorized insubordination. Watch the teacher, and still be reasonable with him. If your boy does not learn as rapidly as he should, see if some of the fault is not in the boy. If you neglect the school, you neglect your duty as a citizen.

Statistics show that consumption, which has in years past made such frightful ravages in this city, is now on a decline. Between 1881 and 1885, though the population increased nearly 200,000, the deaths from consumption decreased 116. It is doubtless true that many consumptives who contract the disease here, go elsewhere to die, yet it seems probable that something has occurred to stay in part the ravages of the disease. Doctors attribute this decline to the fact that people know more about the disease than formerly. They are being educated up to the idea that in prevention alone lies the cure. It seems to be generally admitted that people, as a rule, have more regard for the laws of health. They are dressing more warmly and strive more successfully to avoid exposure and impure air. Women are wearing heavier shoes and shaping their dresses so as to allow more space for their lungs. Millions of dollars are spent each year for nostrums warranted to cure the disease. The consumptive is always hopeful, always imagining he is better. This hope lures him on from one treatment to another. The only "cure" for consumption lies in taking care of one's self, and thus resisting all inroads of the disease. Good food, good and warm clothing, shelter from severe exposure, plenty of sleep and a happy, restful mind, are the conditions needed to stay the disease.

TWO FARMERS.

Two farmers we know, own two farms which join. One farm contains 50 acres, the other 110. The farms are in New England. Farmer A, with his 50 acres has time to go to church, to the picnic and Grange. Time and again, while out riding with his family, he passes by farmer B, toiling in the field with never a thought for anything but labor. Farmer A's wife has a horse of her own, which she can drive as she likes. The boys and girls have books and magazines and the time to read them. Mrs. B. has to beg for days for a horse, and then must take the old mare that can only be induced to hasten out of her slow walk by a thorough application of the stick.

Every rod of the smaller farm does its work. Manure is a respected friend. The crops raised are those that sell for cash. The soil does not run out because the farmer makes a business of keeping it up. On the larger farm there are weedy pastures. The manure is put into small strips of the best land. The grass is never fertilized. The soil is expected to make up in area what it lacks in quality. Farmer B. makes money, for he never spends any. He looks across at his neighbor and sneers. Do these extra horses, these books and papers pay? Not a cent in cash. Farmer A. puts it like this: "Neighbor B's idea of true profit is different from mine—that's all. He wants his in hard cash; I'm ready to spend a part of mine in comfort. I can't spend my money to a better advantage than in making my family contented. I could save this money and buy more land, but I like my little farm. I feed it and it keeps its strength. Why should I spend the best part of my life in continually grubbing for money that will never benefit me?" Now friends, which plan do you like best? Which are you following? What is your idea of true profit? Is your money in the bank, or is it invested in happiness? Think it over.

PROPOSED CURTAILMENT OF INDIAN RESERVATIONS.

Under the late Indian Appropriation Act, the Secretary of the Interior has just appointed a Commission, consisting of the Hon. J. V. Wright, of Tenn., Bishop Whipple, of Minn., and Charles F. Larabee, of the Indian Office, to negotiate with certain tribes of Indians in Minnesota, Montana, Dakota and Idaho for the purchase of such surplus land as they may be induced to sell. The Commissioners are charged to make no arrangement without the full consent of the tribes concerned—that is, of course, the consent of the majority of each tribe—and no agreements will be binding until they have been approved of by Congress. They will first try to satisfy the Indians of Leach Lake, Fond du Lac, Grand Portage and a few other small reservations about the head-waters of the Mississippi, for damage done to their lands by the overflow from the reservoirs constructed by the Government half-a-dozen years ago. About 1,600 Indians have been ruined by these overflows, and an effort is to be made to remove them to the White Earth Reservation in Western Minnesota, together with a few other half-starved bands in the same section, indemnity being assured to them.

The Commissioners will next move west to the Fort Berthold Reservation on the Missouri, in Dakota. This has an area of 2,900,000 acres and a population of only 1,900—Blackfeet, Piegeans and Gros Ventres. These are about the most backward of all the Indians, and are supported almost entirely by the Government. They can do nothing with such a vast allotment of land, and would do better on a more limited range, aided by Government instruction and support in agriculture and stock-keeping.

Westward, in Montana, the Blackfeet Reservation contains 21,500,000 acres and a population of less than 7,000 Indians. Allowing 320 acres to each Indian family, the surplus land would equal the State of Maine, and if bought by the Government at $1.25 per acre, and paid for in bonds bearing four per cent interest, it would return an income of $1,000,000 a year. Under the same conditions the surplus land of the Crow Reservation, extending 200 miles along the Northern Pacific Railroad and thence south to the Wyoming, would produce annually $223,000. Now every buck, squaw and pappoose has an average of two square miles of land very well adapted to agriculture, especially with irrigation.

According to a report made by Gen. Sheridan, there are in the Indian reservations in Dakota and Montana an aggregate area of over 54,600,000 acres, and a population of less than 45,000! "The surplus area of 81,000 square miles would produce an annual interest of $2,500,000"—and be just the size of Kansas.

The Commissioners will then go further West into Idaho and Washington Territories and try to induce the Spokanes and Pen d' Oreillas to go on the Flathead Reservation in Montana, where they will have a magnificent country of noble mountains, frequent streams and rich lands, and be among the most advanced Indian farmers of the Northwest; for the Flatheads cultivate fine farms and live in comfortable log houses.

It is against the best interests of the Indians that they should be allowed such vast areas of land, of which they can make no use. They are not advanced enough in civilization, and are too poor and shiftless, to engage in agriculture or stock-raising successfully. The buffaloes, on which they mainly depended for support, have been nearly exterminated, and at present they would starve on the results of hunting over these large areas. Railroads and settlements are pushing westward, and the country all around the reservations is being rapidly taken up, and it will be better for the Indians and white men if the former get an allotment of a liberal area of land for each family, and are honestly indemnified for the surplus of their reservations surrendered to the Government, which can, in turn, sell it to *bona-fide* settlers. Railroad companies and cattle kings and syndicates are the most persistent advocates of the opening up of the Indian reservations at present. Hundreds of reckless adventurers, like the Oklahoma boomers, are either paid or encouraged by these to keep the subject constantly before the people. In whatever measures the Government may take, however, the interests of honest settlers—pre-emptors or homesteaders—must be always held paramount to those of all others. Nor should the interests of the Indians be for a moment neglected. The names of the Commissioners give universal satisfaction, and it is to be hoped that the results of their labors will also meet with the approval of all fair-minded men.

BREVITIES.

We repeat the suggestion already presented in these columns, that the very best way we know of to break a hen of the sitting propensity is to confine her in a yard with a harmless dog.

Don't you see how our pious political partizans are collecting all the benevolent Indian sentiment they can, so as to divide the reservations among themselves and add more fuel to the fires of railway greed that are consuming us?

The white blackberry Crystal White is now in fruit at the Rural Grounds. It is delicious in quality—the berries of medium size and as white as a White Mulberry. There are two pities as to this: one that it is not hardy; the other, that it is not prolific.

Four or five years ago the Black Champion Currant was advertised in England as in size of berry and raceme far ahead of any other black currant. We imported a plant which is now ripening its fruit. Beside it is the Prince of Wales, and they seem to be the same.

"Give us good mothers; they make us what we are," says Mr. Stahl in his article on next page.—"Did you ever see a baby that would not crawl towards a blossom?" Read Mr. Stahl's excellent paper, good mothers and fathers. The careful reading of it may do you a world of good by influencing your "policy" in the management of your children. It will interest you at any rate.

Mr. Stewart, writing us from his home in Highlands, N. C., speaks of the bright, sunny, brisk, invigorating Winters they enjoy there, "with cold enough to make the warm sunshine pleasant, and sunshine enough to make the cold bearable without thick clothing. And the water—the purest and softest; and the air the clearest and brightest, making the stars seem like lantern-lights floating midway in the atmosphere."

The fault of many journals now-a-days is that they consume so much space in giving human names to plants and personal authorities for facts when they should be quoting more direct from the ground, and let plants and animals have *their* say. The other way ministers to our absurd American egotism, which is really of no more account in science than the identity of the particles of water in the rising and falling tide.

The Rural, as has been stated, is now trying the Langshan breed of poultry. We secured three settings and have but nine chicks, seven of which are roosters. Oh! the perversity of eggs! We are prepossessed in favor of Langshans. The Black Cochin is itself a fine breed, though never a good glossy black. The Langshan comes from a country colder than the climate of some of our Northern States, and the breed is no doubt a very hardy one.

A well-known agriculturist and farm writer says, in a private note to the Rural, that we should try to teach our Government authorities something about grass. The education of our Government is the most fearful tax we have to pay in a republic. If our officials would only draw their pay and go to sleep comfortably when we get them into a snug office, we should be all right; but they won't. They are bound to do something, and ten to one it will be mischief.

The Oleomargarine gang are said to be determined to oppose the re-election to Congress of every Representative who voted in favor of the Oleo. Bill, wherever there is a chance of defeating him in the nominating conventions or at the polls. A large "corruption fund" has been collected for this purpose, and the first attempt is being directed against Representative Allen, of the Lowell District, Mass. It ought to be an advantage to candidates to be opposed by this unscrupulous, fraudulent monopoly.

At the recent Connecticut Prohibition Convention, our esteemed friend and contributor, P. M. Auger, was nominated for Lieut.-Governor. This is an admirable selection. We are glad to commend it. Mr. Auger is a sound, sensible man, with honest convictions and the courage to stand up and enforce them. He is a practical farmer—a man of the people. The farmers of the country are prone to complain that their rights are not respected as they should be. Here is a chance for Connecticut farmers to stand up and be counted, by voting for one of their own fellows. We shall see how much of their complaining is all "talk," and how sincerely they want a representative from their own ranks.

Educational.

HOW SHALL WE EDUCATE OUR CHILDREN AGRICULTURALLY?

J. M. STAHL.

Some new ideas; home instruction the prime necessity; to begin in the cradle; not to be taught in schools or colleges; nor from text books; the mother as a teacher; kindergarten with farm things as object essons; home influenees; fruits and flowers; the child must own something; a change needed in school books; papers as teachers; pictures; agricultural story books.

THAT our children "may appreciate the benefits of farm life and turn them to the best advantage," they must be educated in a love for the farm, and in the science of farming. They must be taught more, but these two things lie at the foundation: for the benefits of farm life lie in the ability to till the farm successfully (not to make money solely, as we shall presently see) and an appreciation of those benefits lie in the love of the farm.

This cannot be taught as a separate branch of instruction in our country commou schools. The art of farmiug cannot be taught there; there is no time for its science. School days are already too short for the farmer boy and girl to accomplish the legitimate work of the public schools. Nor can a love of farm life be instilled there. It cannot be taught in our agricultural colleges. The masses cannot attend them. Tho' every young man and woman could, the work must be begun long before they are young men and women. Colleges are not for children: this teaching must be. Neither could it be taught in primary agricultural schools, though we had them and there was room for them. The idea of school must be eliminated from this course of instruction. The teachiug must be unconscious to the child.

Neither can the lesson be learnt from strictly agricultural text books. We have these already. They do not teach this lesson. True, they are not for children: but make them so, and you will destroy the second part of this education. Children do not like that which must be learned, though you make a story book of it. You must conceal the study of theories and facts if you would at the same time awaken an appreciation of them, a love for the farm, its work and its benefits. I have condemned text books and schools—study. In justification I say that nearly all my life has been spent upon a farm; I love children, and I have kept school. I know the farm, the children, the school, and I kuow I am right in my coudemnation.

This must be taught first and above all else in the home. There will be several teachers in the home, but the most important is the mother. Who can teach as the mother? Ah, heaven! Give us good mothers, they make us what we are! I can uot tell of all the ways a mother can educate her children agriculturally, for it would be a recital as boundless as a mother's love. But let her siug agricultural baby songs like

"Little Bo-Peep has lost her *sheep*," etc.,

above the cradle. When the very little child comes to mother to tell it a story, very likely to go to sleep with, let her tell fairy tales or fables of the farm—what the birds, aud bees, aud flowers, and grass, and leaves, and wheat say and do, how they sleep, and grow, aud work; what the sunshine, and rain, and wind say to them—a thousand fanciful stories can be made of these. And what a wealth of material for little childrens' stories do the ducks, chicks, piggies, lambs, colts, calves, etc., afford! The child will learn to love the farm and all about it almost as it learns to love its mother, Its mind will dwell upon the farm, its thoughts be about it, and it will grow alert and ready for *instruction*. When this time comes, let the mother take a flower, a tuft of grass, a bird's nest, something of this sort, and tell the children all about it. Let her tell how the root eats and drinks; how the flower supports bees and moths, and finally perfects the seed; how the birds build their nests, rear their young and migrate. Let the subject be pleasant and the lesson will be pleasant, for the instruction will be pleasant, never fear. No one can talk and teach like "mother," you know; at least to the little child. And the child will continue to grow in the love and knowledge of these things—the birds, flowers, pigs, lambs, colts, calves, grass and grain. The children will tell each other what the birds say, inventing all sorts of fanciful tales; how the grass and the flowers grow. They will come and tell "mother" the very things she has told them, only embellished with all sorts of fancies, And they will wonder and want to know more. They will want to know all about these things. Oh, they will ask a thousand questions. And how can they help loving these things when they are so interesting? How can they help loving Nature's great picture-book and toy-house, more wonderful and pleasing than any work of man? How can they help loving the farm when it contains all these interesting and beautiful things? Why, the farm, I care not how small it may be, contains materials for interesting, loving iuvestigations for a life-time. Awaken the mind of the child to an investigation and understanding of these things, and you, while teaching the advantages of farm life, will also awaken an appreciation of them so strong that it will ripen into a love of the farm that will keep the children always there.

"But," you say, "that is all fanciful, no mother will do that." You do not know what a woman's ingenuity and a mother's love are. The mother amuses and instructs her child with and about other objects. Will she not take up for this purpose the things pertaining to the farm when she sees she can do so much for her child?

Co-existent with the influence of the mother is that influence of the home so well understood but impossible to analyze. Little things are responsible for it—sunshiny rooms, clean, white beds, flowers, pictures, rugs, birds, for examples. There must be an air of pleasantness and intelligence about the home. The child must learn to love it because it is pleasant, because it is a lovely epitome of all the advantages and benefits of farm life. How can the child learn and love these benefits if its home is devoid of them?

I can not go into details but let me mention two things—fruits and flowers. These belong distinctively to the farm. Children love them. I have yet to see a child that does not love fruit. The little stomach is grateful for it. Fruit to eat in abundance is one of the greatest advantages of farm life. It means pleasurable health. Fruit to cultivate is as great a benefit of farm life. It has a marked moral effect often noticed. Bring these benefits to the practical notice and consequent enjoyment of the child, aud of course it will appreciate them.

Flowers are as important as fruit. One pleases the palate, the other the eye. Both alike have a refining tendency. Flowers make the home, the farm beautiful. Children love flowers. Did you ever see a baby that would not crawl toward a blossom? Take advantage of this love for flowers. Make the farm home,—the house, the yard, the garden, full of flowers. Rest assured that the child will see and appreciate this advantage of farm life.

Here let me anticipate somewhat. Give the child a plat of ground all its own.—for flowers first, because it can cultivate them first. Take a seed—a bean and a grain of corn are best—and show it how it is formed—of plumule, radicle, cotyledons and food—and tell the child how it grows. The child will listen with wide eyes and mouth. It will ask questions. It will never plant one of its flower seeds afterwards without thinking of what has been told it. Then when the plant appears explain the use of the different parts—which eat and which breathe. It will soou learn the easier phenomena of the growth of its flower bed. Make this plat all its own. It will tend and love it, for it is its own, and it will blossom by and by. Later give it a plat in the vegetable garden, then some berries or fruit trees, and then a field of grain and some farm stock aud chickens, all for its own. Tell it all about these. It will listen and be interested, for these things are its.

But as it grows older there must be more aids. It goes to school. Its readers should be about the farm. Starting with the lowest the whole story of plant life could be taught without the child being conscious of it, and the book would be interesting. The child takes up arithmetic. Instead of the problems being about buying and selling bonds, exchange, custom-house duties, etc., as they are, let them be about something that will concern the farm. Such problems would answer every purpose better. His readers will have told him of the soil he is to cultivate, of the plants he is to grow, and the stock he is to feed, or the tools he is to use. Let the problems be such as he must solve to be a successful farmer. The readers will prepare him for this work. I cannot particularize; but suppose the problem be, How many pounds of pork will so many pounds of corn make? If corn contains so much of this element and that, milk, peas aud cotton-seed meal ditto, what proportions of each should be used for a ration for a pig, the elements to be so and so? Questions like these would be of incalculable benefit. And when the child comes to study geography, it should not learn the names and locations of all the towns and creeks on the globe, but rather the productions of each place. And it should not learn this by memorizing, but by *reasoning*, from a knowledge of the heat, rainfall, winds, latitude, seasons, and situatiou of the locality. And so with the other studies of the school. The pupil can learn the science of farming while learning to read and to spell, while learning arithmetic, grammar, geography, composition, etc. Let me say right here that composition may be made a powerful auxiliary. The subjects should be about the science, the art and the charms of farm life.

But the education of the child is not yet done. Papers have become the almighty school-masters. They go into every home to instruct and amuse. They will awaken a love for the farm life because they will make it pleasant and interesting. Children read and like papers. Put facts into a book and the child will despise them; put them into a paper and the child is delighted. Why? Because the book is associated with school, study, work; the paper with home, enjoyment, play. We must have agricultural papers for children. Make a story of the facts to be taught. Put pictures into it. Children like pictures. Pictures teach. One picture in a dictionary will teach more than a column of words. Hide the facts in humor, even. We all like fun—children best of all. The mind will absorb the fact, the fancy be pleased with the humor. It will be a mental sugar-coated pill. Make the first lessons easy: grade up to something higher. We must have children's, youths', young men's and women's papers—all agricultural. These will teach the facts of agriculture, and not create a dislike for farm life. Boys buy revolvers and run away from home from reading blood-and-thunder stories. Girls meet their ruin through the agency of trashy novels. These facts show the influence interesting stories have upon the youthful mind. Agriculture may be made an interesting story. Have not geology, zoology and chemistry? And when you make an interesting story of them, you will not only teach the child the benefits of farm life, but will awaken an appreciation of them.

Just a little in the rear of the story papers, after the child is interested, should come agricultural story books. And when the child is child no longer, it will ever read the papers and books we now have. It will be noticed that I have omitted to state how the moral benefits of farm life may be taught, and an appreciation of them be iustilled This work cannot be done by direct means. Don't preach. Get the child interested in the farm and loving it in the ways I have pointed out, and all else will come. Good books and a good home on the interesting, loved farm will never be forsaken for the sin and excitement of the city.

I have beeu compelled to omit many things; and what I have given are merely hints. Read and think, and you can supply what space forbade me to write.

Adams Co., Ill.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

DEHORNING CATTLE.—For some years past, Mr. H. H. Haaff, of Henry Co., Ill., has practiced "dehorning"—that is, the sawing off of the horn close up to the skull. This practice has been quite common for years in parts of Ireland and some other countries, but has always been looked upon with horror by the great majority of the people. Mr. Haaff has advocated his system publicly, and attracted considerable attention. Last Winter, in order to test the matter thoroughly, he was arrested for cruelty to animals. After a trial of four days he was discharged, as it became apparent that no case could be made against him. The evidence was peculiar. That for the prosecution was based on theory almost entirely. The operation was said to be cruel, because the witnesses could not see how it could be otherwise. On the other hand, witnesses who had seen the operation performed, were positive that there was no great pain, that the animals were at once ready to eat and drink, and that in milch cows the milk secretion was not in the least diminished. With such testimony, no other verdict could be possible. This little book has been published by Mr. Haaff in order to satisfy the questioners who have been attracted by the published account of the trial. It is asserted that dehorning tends to "gentle" cattle beyond all question. It is claimed that a "man-killer" bull was so cowed by the loss of his horns that a boy could lead him. It is claimed that the destruction of all the horns in this country would save 200 human beings and 100,000 cattle every year, that being the estimated number of lives sacrificed. Nearly all loss of calves by abortion, one-fourth of the winter feed, one half of the shed-room, all the manure now wasted about sheds and stables and all loss in shipping cattle would be saved by dehorning, if we may believe Mr. Haaff. Of course, these statements refer more particularly to Western stock raising, where larger herds are kept and where, consequently, less care can be given to individual animals. Speaking of polled cattle, Mr. H. believes that by a careful polling of calves, we may, in a very short time, have any breed of cattle polled. He thinks any organ not provided with full and direct arterial circulation is liable at any time to be not produced. He thinks that polled Holsteins or Short-horns could be obtained in six crosses, but that it would take 16 crosses to produce polled Herefords. He appears to think that dehorning should be done with the same spirit that causes us to trim trees, pare our nails, cut corns, castrate animals or ring pigs' noses. He thinks that "hollow-horn" is caused by the freezing or chilling of the horn. Dr. Law is quoted as saying; "I wish dehorning might become as common as castration is now." The great argument of the book is that sawing off the horn close to the head does not cause a fraction of the pain that comes when the horn is knocked off. The suture that divides the skull of the ox runs up and down the face. A heavy blow on the horn tends to open this suture and congests the brain. The pain is not so much at the place where the blow is struck as it is at the brain itself. Persons who have watched the agony of an animal that has received a blow upon the horn, have been quick to say that dehorning must be horribly painful, when really this would not necessarily follow. Interesting arguments to show that the horn is not particularly sensitive to pain, are introduced at such length that they cannot be repeated here. It is stated that the circulation of blood in the horn is extremely small, and that changes are very slow. The nerves that are sensitive to pain are distributed with increased supply to parts that undergo rapid waste and repair, and are diminished in a marked degree where the processes take place more slowly. The outside shell of the horn is as absolutely incapable of pain as the hair, or the free border of the nails. The central portion of the horn, in young life, consists entirely of cartilage, separate and independent of the frontal bone. As age increases, it is converted into true bone by the deposition in it of mineral matters. Cartilage and bone are not sensitive tissues, and cutting can be done in them with comparatively little pain. The only sensitive portion of the horn occurs at its base where the true skin unites with the periostal covering of the bone. The sensitive portion exposed in sawing off a horn three inches in diameter will not exceed 1⅛ square inch, so that the operation could hardly be so painful as where a red-hot iron is used upon a calf's head. Mr. Haaff states that as he performs the operation there is little bleeding, and comparatively little pain. He thinks old animals experience less pain than younger ones, as in growing animals the membrane at the base of the horn must be tender and more sensitive. Mr. Haaff disclaims any great interest in the present polled breeds of cattle. We can never afford to do away with Short-horns, Herefords, or Holsteins, but these same breeds, minus the horns, would be more valuable than they now are. Breeders are already at work upon the Holstein breed, as there is a demand for a polled dairy animal. Mr. Haaff, in giving directions for performing the operation, is not so clear as he is in proving that the pain is not very great. We do not believe we could follow his directions and not torture the animal. We should not care to try the operation until we had seen it performed and had studied the structure of the horn more carefully. It is easy for a surgeon to cut off a limb, but an amateur would make a horrible job of it, and we are of the opinion that farmers who follow Mr. Haaff's directions, without practice or study of the animal's head, will cause untold suffering. That dehorning can be done, by a practical hand, with comparatively little pain seems evident; that an amateur can take a saw and cut off horns with any pleasure or profit to himself or the cattle, we do not believe. The book is interesting, and will give any stock owner much to think about.

FANCIERS' HAND-BOOK.—Pamphlet from the Associated Fanciers, 237 S. 8th St., Philadelphia, Pa.—This book is given up to a description of the different breeds of dogs, with hints on handling and managing them. All breeds of dogs are represented and well illustrated. A short chapter on the disease of dogs contains many excellent hints for properly describing the symptoms of common diseases. This association possesses unsurpassed facilities for supplying good dogs at all times. Instead of being reared in close kennels, as many show dogs are reared, the breeding dogs are sent into the country where farmers take a contract for raising the puppies. In this way the dogs are stronger, healthier and much better than they otherwise would be. There are many interesting points in this pamphlet which should be studied by those who wish to procure a good dog. Having had business relations with the company, we can commend them to our readers as honorable business men.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

ONLY A WOMAN.

ONLY a woman! A delicate woman!
Who starts at the sight of a mouse;
Whose weight is four-score
(Not many pounds more),
And yet what a power in the house.

Calmly, serenely, she orders her household
With almost a soldierly drill;
From chaos she's bringing,
Yet all the while singing,
Sweet order, her part to fulfil.

Only a woman! a soft-hearted woman,
Whose bright tears are ready to flow;
And yet, whose small hand
Is made to command
In her womanly sphere here below.

Small things may try her and ruffle her temper,
And yet with great trials she'll rise,
And shame even man,
With some well devised plan
That must have dropped down from the skies.

Only a woman! a far-sighted woman,
Who strives to make *men* of her boys,
Who reads their young hearts,
The while she imparts
True principle in with their joys.

Training her daughters—their constant companion—
Softly leading them each by the hand,
Teaching them truth
In their innocent youth,
That their names may be *gold* in the land.

Only a woman! A beautiful woman,
Now gliding through chamber and hall,
Her laughter and song,
That to home life belong,
Robs many a heart of its thrall.

Joy of her children; queen of her husband;
Who else may claim such a throne,
Strong and enduring,
Sweet peace ensuring,
Who but fair woman alone?

[*Credit lost.*

OF INTEREST TO WOMEN.

PHILOSOPHERS from all time have had their fling at women's dress, but few are so unkind in their strictures as one who says: "By her habit, you may give a neere guesse at her Heart If (like a Coffin) shee be crowned with Garlands, and stuck with gay and gaudy flowers, it is certaine there is somewhat dead within."—GRIFFITHS ("Bethel, or a Forme for Families," 1634.)

Polydore Vergil says of mouruing garments: "Plutarch writeth that the Women in their Mournyng laied aparte all purple, golde, and sumptuous Apparell, and were clothed, both they and their Kinsfolk, in white Apparell, like as then the ded Body was wrapped in white clothes. The white coloure was thought fittest for the ded, because it is clere, pure and Sincer, and leaste defiled. Of this Ceremonie, as I take it, the French Quenes toke occasion, after the death of their housebondes the Kynges, to weare ouely white Clothyng, and if there bee any such widdowe, she is commonly called the White Quene. Mourning Garments for the moste parte be altogether of blacke coloure, and they use to weare them a whole year continually, onlesse it bee because of a generall triumphe or rejoysyng, or newe Magistrate chosyng, or else when thei bee toward Marriage."

Addison thus describes his woman of ideal dress; a description as applicable now as when written 170-odd years ago: "Flavia is ever well-dressed and always the genteelest woman you meet; but the make of her mind very much contributes to the ornament of her body. She has the greatest simplicity of manners of any of her sex. This makes everything look native about her, and her clothes are so exactly fitted that they appear, as it were part of her person. Everyone that sees her knows her to be of quality; but her distinction is owing to her manner, and not her habit. Her beauty is full of attraction, but not of allurement. There is such a composure in her looks, and propriety in her dress, that you would think it impossible she should change the garb you one day see her in for anything so becoming, until you next day see her in another. There is no mystery in this, but that, however she is apparelled, she is herself the same; for there is so immediate a relation between our thoughts and gestures that a woman must think well to look well."

Though Flavia existed long before Mrs. Merrifield wrote "Dress as a Fine Art" she expressed perfectly the ideas given in that work. Says the authoress: "The immediate objects of dress are twofold—namely, decency and warmth; but so many minor considerations are suffered to influence us in choosing our habiliments that these primary objects are too frequently kept out of sight. Dress should be not only adapted to the climate; it should also be light in weight, should yield to the movements of the body, and should be easily put on or removed. It should also be adapted to the station in society and to the age of the individual. These are the essential conditions; yet in practice how frequently are they overlooked; in fact, how seldom are they observed! Next in importance are general elegance of form, harmony in the arrangement and selection of the colors and special adaptation in form and color to the person of the individual."

Good St. Francis de Sales would have regarded the work quoted as a foolish vanity, if not worse, for he says: "The married woman may and ought to adorn herself when she is with her husband, and he desires it; but if she should do so when she is at a distance from him, it will be asked whose eyes she desires to please with that particular care? A greater liberty is allowed to maidens, because they may lawfully desire to be agreeable to many, although with no other outcut than to gain one by holy marriage. Neither is it esteemed amiss that widows who purpose to marry should adorn themselves in some measure, provided they betray no levity; for, having already been mistresses of families and passed through the griefs of widowhood, they are considered to be of a more mature and settled mind." However his protest against undue regard for dress in married women is more than counterbalanced by his opinion that maidens may be allowed more scope in the matter, though the pious monk is a little bit mean in suggesting that our only purpose should be the capture of a husband. This recalls one of the New Jersey blue laws, still extant, though we believe not enforced rigidly. This statute declares that any maid or widow who shall decoy into matrimony any of His majesty's subjects, by the use of paint, powder, false hair, high heels, or any attire calculated to deceive, shall be judged guilty of witchcraft, and punished for the same.

FITNESS.

"THEY'RE all farmers!"

The speaker, a ragged, dirty little fellow, was right; and I glanced instinctively around at our crowd, to see how he had found us out so quickly, and why he seemed so disgusted. In face, form, or expression, I saw no perceptible difference between this and a city crowd; a trifle more sunburn and rosiness, maybe, and not much either, for pink and white complexions are not the fashion at this season even in the city. So to my, perhaps, partial eyes, we looked quite as intelligent and bright as other people, and so I came to the conclusion that the difference must be in our clothing, for I was obliged to confess, that here was a difference, and not in our favor either. Not that the women were dressed in "caliker" or the men in "home-spun," as some writers are fond of picturing country folk. No, we had gone to the other extreme.

A city girl, would not think of going on a railroad excursion to a lake shore pic-nic, wearing a lace trimmed violet satin dress, and Gainsborough hat with snowy plumes: but a farmer's daughter at my elbow was thus attired; white dresses of swiss and cross-bar, elaborately trimmed with lace and embroidery were met at every turn, and on the elders, brocade and satin were more common than gray, brown and black cloth, which would have been so much more appropriate to the occasion.

Feeling as disgusted as the small boy looked, at the lack of fitness thus displayed, it made me think that it would be well to pay more attention to this subject—Fitness. Not alone in dress do we err, but in many other things, which not only make us almost ridiculous to thoughtful people, but also causes much outlay of time, money and strength, which we can ill afford.

It is no uncommon thing to see a low roomed cottage in the country furnished in imitation of its statelier sister of the city, with heavy curtains and stuffy upholstery, when light, tasteful chairs and tables and airy draperies would be so much prettier and agree with its surroundings.

If houses were studied and fitting articles selected without regard to prevailing fashions, more satisfaction for our money would be obtained and fewer changes desired. But some one will say:

"Yes if you have plenty of money you can do this but we cannot exercise our taste."

This may be true in some cases, but generally those who make this plea are the ones who scrimp and save in order to get some costly articles because their richer neighbor has them, without thinking whether they will fit or not such articles generally proving "apples of Sodom" to their possessor. If we would be satisfied at all, we must choose with discrimination everything from the food we eat to the sermon we listen to. If I am in the country I expect fresh fruit and vegetables—ices and costly confectionaries are not fitting. If I am tired, sad, discouraged, I want to listen to the minister, who will tell me of a Savior's love and care, not caring whether his sentences are well rounded and delivered with the gestures of an orator or not. If I go simply to be entertained, then I shall choose the orator. Farmers are not the only ones who blunder into unfitness, either of clothes, manners or furniture, but there is much room for improvement with us. Circumstances *do* alter cases, and we would be better, happier, and more useful if we studied them more and fitted into them better. Life is made up of small things, and nothing is too trivial to be thought over and made the best of. MARY MANN.

THE NECESSITY OF DESULTORY READING.

WE expect that all the wise people who believe strictly in the Gradgrind view of reading will look upon our title with cold scorn, to say the least. But we don't use the term *desultory* as meaning hasty, capricious, or vacillating; but returning to the Latin derivative we find that the name Desultor was applied to a warrior who leaped from charger to charger in battle, thus gaining increasing energy and activity. This is the true idea in desultory reading—not cramming a quantity of undigested knowledge, but obtaining a variety of information, while increasing the range of intellect by the same means.

An old proverb says: "Beware of the man of one book," and truth to tell, the person who only reads one book, or one author, has too often the capacity of becoming an unmitigated bore both to himself and to others. On the contrary, one acquainted, even slightly, with a wide range of subjects is usually able to converse pleasantly and intelligently with many people of diverse acquirements. Very few women having many household cares can give much time to reading, and we most strongly recommend so-called desultory reading for their stray half hours. If they confine themselves to one subject in solid reading, they are much in the position of a person only possessing a $50 bill when there is occasion for small change. We all ought to have a background of solid information, but we must also possess lighter weapons for conversational sharp-shooting. Heavy knowledge only is apt to give a formal pedantry very disagreeable in general society.

So, to a person of many occupations, newspapers and magazines are really the best literary food. True, you get a good deal of froth, but it is both sparkling and palatable, and there is always a sub-stratum of information, and that of the best. We hear many complaints of "newspaper English," but we think some of our "solid" writers are quite as apt to be slip-shod in their diction as these busy scribes who picture daily history as it flies. As a general rule, women do not read the newspapers sufficiently, and this is one branch of desultory reading they may find very advantageous; it gives a much broader outlook, removing prejudice and provincialism. As for the magaziues, they are always brimming over with good things, both informational and amusing, from the latest discovery of science to the most recent folly of fashion.

We should always give place in our desultory reading for a fair supply of good fiction. The proper study of mankind is man, and where can we find bright delineation of all our follies, frailities and virtues as in a clever novel? If we happen to be shut up in a box, as far as society is concerned, our faithful friend, the novelist, takes us by the hand and introduces us to a host of book friends, whom we soon regard with positive affection.

We end our little homily with the words of one who believed himself in desultory reading—and desultory writing, too—the great master who added Colonel Newcome to our list of book friends: "Might I give counsel to any young man, I would say to him, try to frequent the company of your betters. In books and in life that is the most wholesome society. Learn to admire rightly; the great pleasure of life is that. Note what great men admired; they admired great things; narrow spirits admire basely and worship meanly."

IN WOODLAND SHADES.

WHAT can be better for mind and body, these midsummer days than an impromptu picnic? Not the set, artificial affair that usually goes by that name, where a church or school or society takes a journey to some "grove," so-called, where lemonade venders and that ilk turn the face of nature into a Cockney imitation. No, we mean an occasion where a dozen or more congenial spirits, representing one or two families, take to the wood, accompanied by their hammocks and lunch baskets, there to spend a happy, gypsy day. We have assisted, to our sorrow, at one or two festive occasions of the first mentioned type, at which all the girls wore gay muslin and lace frocks, that made any attempt at gypsy abandon an impossibility, and where the artificial surroundings made the assumption of one's best society manner appear a necessity. But these were not real simon-pure picnics.

There was another joyous occasion, at which we assisted in the French sense of the word—where plain cotton frocks and spontaneous gayety were the rule. The scene was a picturesque grove, natural as Arden itself, with its leafy trees and sparkling spring. The picnickers came out for a day's relapse into primitive condition, consequently there were no society manners, no heart-burnings, no social fiction. Some botanized, some sketched, some read or wrote, according to their several fancies. The only material drawback was the presence of several objectionably tame cows, who possessed amiable and inquiring minds. One of them ate a doiley and a package of ham sandwiches early in the day, while another, an ingenuous beast with a terra cotta complexion and a fluffy bang, much embarrassed the student of the party, who was trying to read, by hovering around with a beseeching air that seemed to demand more sandwiches. Finally the student responded to her pleading with biscuits and ginger-bread, but as the result of this the entire herd hung round begging for biscuits, until the picnic party was obliged to request the removal of these too-confiding animals. A picnic of this type—barring the cows—is one of the best things to strengthen tired nerves and over-worked bodies; the pure air, novelty, and placidity will do much to rest nervous, worried people in city or country. Try it.

GOLDEN GRAINS.

IT is no virtue, but only luxury, to take away the crown of thorns from a lacerated brow, the prickly girdle from sore nerves.—*Jean Paul Richter*.....

Is thy friend angry with thee? Then provide him an opportunity of showing thee a great favor. Over that his heart must needs melt, and he will love thee again.—*Richter*...

I CHOSE my wife, as she did her wedding gown, for qualities that would wear well.—*Goldsmith*.....

BE loving, and you will never want for love; be humble, and you will never want for guiding.—*Dinah Mulock Craik*.....

AS a rule it will be found that it is not the poor who practice small economies. If they had the will and the skill to make the most of what they have they would soon rise from their low estate.—*Good Housekeeping*.....

No book is worth anything which is not worth much; nor is it serviceable until it has been read and re-read, and loved and loved again, so that you can refer to the passages you want in it, as a soldier can seize the weapon he needs in an armory, or a housewife bring the spice she needs from her store. —*Ruskin*.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

GOOD BYE.

AND must I leave the dear old home,
Afar on foreign shores to roam?
And are the moments drawing nigh
When I must give the sad good bye?
Each little tree, and bush, and vine,
Doth round my very heart entwine;
Each nook and corner seemeth dear,
Each bit of landscape far, or near,
Hath its own tale of love for me.
And, more than sad my heart shall be
To leave the dear familiar scene
Where much of life's best joy hath been.
Ah me! the world is large, and wide
And holdeth much of sin beside—
And here, within these sheltering walls
So much of peace, and comfort falls,
So much of beauty always nigh,
'Tis hard, old home, to say good bye.
Long years may pass ere we again
May gaze on thee—and yet not vain
Are all life's changing scenes, we know
Each hath his part and work below,
And not in vain the cross we bear—
It pointeth to a land more fair—
When we, with all our conflicts o'er,
Shall rest in peace, forevermore.

MRS. S. B. EATON.

HOUSE-KEEPING IN CALIFORNIA.—XII.

MARY-WARER FISHER.

ONE day a fair, young matron came in announcing herself as a next-door neighbor. "I have long wanted to come in and see you," she began, but I have been so very busy. You see I have four little children; my mother is an invalid and I have no servant. My husband won't let me have a Chinaman in the house on account of the children. We give out our washing, and I am supposed to have a colored woman come in every week for a day—only half the time she doesn't come; and as for a white woman in the kitchen, I can assure you it is impossible to get along with one. They are unwilling to do washing, they want very high wages, and are out every afternoon and can never be depended upon in the evenings; while their impertinence is intolerable. What the housekeepers on this coast will do if all the Chinese are driven out I don't know.

We shall all have to board, I fancy. I was born and reared in England and my mother never taught her daughters how to work, and she knew nothing herself practically of housework. After my father's failure in business, and his death, she opened a school for young ladies, was stricken with paralysis and is now very much of an invalid. She thinks it is wonderful how I turn off housework as I do. At first my hands—which I was so proud of—were in a terrible condition; for you see I can't bother to look out for my hands when I have work to do. And mother says that my husband—he is an American, you know—is the most extraordinary man she ever knew about helping; no Englishman would think he could do for his wife what mine does—wash and dress the children; and as for sweeping, he won't let me touch a broom. Once a week he is up at five o'clock and sweeps the whole house. He is a chemist and engineer, and the firm that employs him is not doing full work now, so that he has plenty of unoccupied time. A man can do so much if he only thinks so, and sets about it." And in such wise she rattled on, and I thought much of her cleverness after she went away. She had been college-bred in England; reared in luxury, and now, after a married life of eight years, had four children, was largely doing her own work and always looking in her person the real lady that she evidently was. Her children always seemed to be very carefully looked after and she was one of that large class of intelligent, tenderly-reared women who are forever equal to emergencies.

Anent Chinese servants, some of the women on this coast have had unusual experiences. Housekeeping friends of mine in a town on Puget Sound where the "Knights of Labor"—who are Knights of Sedition as well—endeavored to drive out the Chinese by violence, wrote me as follows: "I still have my Chinaman and shall keep him as long as I can. On Sunday while at breakfast, a Chinese rushed in saying that a policeman and a lot of men came into his wash-house, broke the dishes, knocked down the stove, gathered up blankets and everything they could hustle together and piled them into an express wagon, shouting that the Chinese must go, while going from place to place and gutting all the Chinese cabins. The papers stated that the Chinese wanted to go—with pistols pointed at their heads. For two days and nights we hardly slept or ate. In the afternoon of that same day, my servant went out to see if the mob had left anything in his house, and upon his return several of the rioters saw him and ran after him. He leaped the fence and got into the house, as white as a sheet. When he explained matters I sent him up-stairs, and then fastened up the house. My husband who, you know, is Mayor of the town, was out in the street and I was alone. Presently these seven men came to the kitchen door and banged away. I went to a window and asked what they wanted. 'We want your cook! your Chinaman.' I said no, you can't have him. My husband is Mayor of Seattle, and bound to uphold the law, and I as his wife must do the same. 'Mayor or no Mayor,' they shouted, 'we want your Chinaman and will have him. If we don't get him to-day, we will to-morrow.' I replied, 'this is my house, and I will 'defend it.' 'If you don't give up your China man, we will blow up your house,' repeating the threat many times. Well, you can imagine I was frightened. I had no weapons—and no one to whom I could call for aid. I dared not leave the window, for fear they would break it in, and so I stood there trying to think how to act, when unexpectedly some men came to my rescue. Of course we had the ring-leader of the mob arrested and he is in prison, but we can't feel safe for a moment. I don't dare to leave the house for fear my cook will be assassinated." And this lady's head is white with years—her servant a long-time trusted one, who relieved her of household care which she was quite unable to carry herself.

Another friend wrote: "We have had terribly exciting times since you left. I think you may congratulate yourself on not being here, for your husband would certainly have been on the law and order side, and you would have felt all the uneasiness that we did. My sons stood in the hollow square that protected the Chinese from the mob. I have told my Chinese cook that it is best for him to go, though, dear knows, we are sorry to part with him. I think they will all have to leave this part of the country, and the apology for servants that will be left us, will, I suppose, strike too, along with the miners. The eviction of the Chinese will not satisfy these miserable wretches of rioters, of course. The Home Guards had to shoot, or be overborne. It certainly would seem that if there was any place in the world that was the paradise of the working classes, this ought to be the one—high wages, land almost for nothing, fuel for the gathering, a fine climate and productive soil. If those pestilential Irish and German Socialists would let the people alone, I do not think there would be any trouble."

Still another friend wrote: "Poor Wong went to San Francisco. He was nearly frightened to death! I still send my washing to our Chinese laundryman, but each time I never know whether I shall see it again; I am now without help—the boys help me all they can out of school, but in a family like ours, you know there is no end to the work. How we are to get on without the help of the faithful Chinese, the mercy only knows, for the work they did, white men will not do, and women, as house servants amount to so little on this coast."

WOMAN'S UNNECESSARY WORK.

A SENSIBLE writer in an exchange says: "I am convinced that at least one-quarter of the work performed by women is unnecessary, and that the world would get along quite as well without it." I am inclined to go further still, and put it at one-half. "I never find time to read," said a lady, at whose house I was calling, and at the same time she sadly threaded a needle with chenille, and remarking that some people had so much leisure, she continued her work of embroidering impossible yellow peaches on a red plush mantle scarf. It had not even the merit of economy, for the materials were as expensive as they were hideous. Any work that serves to make home a charming and lovable place is a sacred duty to a wife and mother; but that which contributes to no comfort or enjoyment, frightful fancy work that has not even any artistic merit, is, indeed, a waste of time and energy—"busy idleness."

Husbands undoubtedly like to feel that their wives are good housekeepers, but husbands are very human, and once let a woman sink the wife in the housekeeper, and her husband will very likely fall into the same error. The "over-clean" woman is a nuisance to her family and friends. I once overheard a conversation between two gentlemen in a car, whose wives belonged to the above class, and, though estimable women, were about as close to godliness as cleanliness could take them. It was during the season of that annual horror—"house-cleaning," and they were condoling with each other upon its miseries. They both voted it an entirely unnecessary evil, and one of them said that during its progress at his house every-thigh was so wet that he always felt as if there was an incipient flood, while his friend said he could endure the water, it was the smell of yellow soap that he objected to.

A woman should never allow herself to become a mere household drudge, and when she finds that she has no time to read an occasional good book, to write a letter to a friend, to read a story to the children, or to walk or talk with her husband, she may conclude that there is something wrong somewhere in her domestic economy, and the more quickly she recognizes and remedies the evil, the better it will be for herself and family. If she is obliged to do her own family sewing, every tuck or ruffle that she puts on her children's clothes is a crime. The hour or hours spent in making an elaborate dress that baby will look "lovely" in, is a waste of energy that a mother who does her own work cannot afford. Baby will look quite as lovely in her eyes in a plain slip, and if he has only his elaborate dress to recommend him to the eyes of others, he might rather pass unnoticed. Give the matter serious thought, oh tired housekeeper; and see if you do not daily take many unnecessary steps, and do much that you might, without injury to any one, leave undone. Rest your body and improve your mind keeping your face and heart as fresh as possible, as you value the love of your husband and children.

Since this is a chapter of quotations, I will end it with the remark made by a sarcastic gentleman "Women seem to me to be divided into two classes, the over industrious, and the over indolent, and of the two evils, I would choose the latter as being the least."

"ONE WHO HAS TRIED IT."

A PRETTY LAMP SHADE.

A BEAUTIFUL lamp shade that almost rivals a porcelain one, is made out of fine thin Bristol board. Cut the sheets the shape of the wire frame, and make a scalloped edge both top and bottom by placing a spool on the edge and drawing around it. Take a number of pressed and beautifully colored Autumn leaves, either natural or the embossed, draw and paint a vine all around the shade, and join the leaves to it in natural order, sticking them on with gum tragacanth, or mucilage. When you have completed the wreath, let it lie under pressure for 24 hours, and give it a coat of colorless varnish. When thoroughly dry, join the shade together with gum, press it dry with a hot iron, and fasten it to the wire frame. It will give a soft mellow light, and if neatly done will repay the trouble.

WESTERN GIRL.

Beatrix in the Household says that if you would train your sons and daughters in the way they should go, you must travel the same road yourself.

DOMESTIC RECIPES.

CORN BREAD WITHOUT EGGS.

Two cups of corn meal, one cup of flour, two and one-half cups of fresh buttermilk, two and one-half teaspoonfuls of soda (just even full), one tablespoonful of salt. Beat thoroughly, add three tablespoonfuls of melted butter and bake.

LEMON HONEY.

One grated lemon, rind and all, one and one-half cup of sugar, one-half cup of butter, one cup of water, two tablespoonfuls of corn-starch. Cook till thick, stirring while cooking. Nice as a sauce or to put between layer cake.

CHEAP FLY SCREENS.

As I could not afford wire screens to my doors and windows, I cast about for a cheap substitute. A carpenter made me some door frames for 25 cents apiece. The window frames I made myself of lath. Measure across the window and saw two sticks for each window. Measure from the sill to as high as the window can be raised and cut off sticks one inch shorter, so that the screen can be put in place easily. Where the ends join, sink one piece into the other that you may have an even surface. Fasten together with eight ounce tacks, which will just go through and clinch. I covered my frames with mosquito netting at five cents a yard. My screens cost but a trifle and answer every purpose that more costly ones would. Of course they will not last as long as wire nets, but with care I expect to use them three seasons.

BED-BUG POISON.

Quick-silver mixed with the white of an egg will cause the bed-bugs to entirely disappear, if put in all the crevices and mattresses. A nickle's worth of quick-silver and the whites of two eggs will be sufficient for two or three beds.

IDA WILLIAMS.

CHOCOLATE CAKE.

One cup of sugar, one-half cup of butter, one-fourth cup of milk, whites of four eggs, one teaspoonful of baking powder, two cups of flour.

FROSTING FOR THE SAME.

Whites of three eggs, one-half cup of chocolate, one cup of sugar, and flavor when cold.

COFFEE CAKE.

Two cups of brown sugar, one of butter, one of molasses, one of strong coffee, four eggs, one teaspoonful of saleratus, two of cinnamon, one grated nutmeg, one pound of raisins, one of currants, four cups of flour.

CREAM CUSTARD CAKES.

One cup of sugar, one of flour, two teaspoonfuls of baking powder, three tablespoonfuls of cold water.

FOR THE CREAM.

One egg well beaten, one tablespoon of sugar, one of corn starch, one cup of sweet milk. Flavor with lemon.

AUNT RACHEL.

TO CAN CORN.

SELECT only tender ears, cut and scrape from the cob and pack as tightly as possible into glass cans. I use the handle of my potato masher. Fill the cans within one-half inch of the top, put on the covers and screw down, but not tightly. Put into a boiler of cold water, first placing something on the bottom. I have had a perforated board made for the bottom of mine. Heat gradually to boiling and boil three hours without stopping. Keep the water within an inch-and-a-half of the top. Fill up with hot water from a kettle kept for the purpose. When done, dip out a part of the water so that you can take out the cans and screw down the covers as tightly as possible. As the cans cool try to screw down the tops. Corn treated in this way *will* keep and be almost as good when opened as if freshly cut from the cob.

MRS. ECONOMY.

PUFF PUDDING.

Four eggs; yelks and whites beaten separately. To the yelks add three cups of sweet milk, a teaspoonful of melted butter and three cups of sifted flour. Stir in the whites the last thing. Bake in butter cups. Eat with hot sauce.

When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

Miscellaneous Advertising.

Catarrh

Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

"One Word in regard to the Profit resulting from a proper preparation of the soil. And as one example will go further than a great many precepts, the case of a farmer of Shawnee County, Kansas, may be mentioned. He took especial pains to make the soil compact for his wheat sown in October. At the harvest in July, he thrashed out 56 bushels and 30 pounds per acre of wheat, weighing 61 pounds per bushel. And no doubt the majority of farms in the United States are fertile enough to produce as much as this, if the crops were not damaged through the poor mechanical preparations of the ground, against which manure or natural fertility cannot prevail. The average yield of wheat is 15 bushels to the acre. No doubt with perfectly prepared soil this yield would be double. What then is the actual value to the farmer of an implement that is perfectly adapted to this requisite preparation of the soil, such as the 'ACME' Pulverizing Harrow, Clod Crusher and Leveler has proved itself to be beyond all question of doubt?" See advertisement on page 524.

News of the Week.

HOME NEWS.

SATURDAY, July 31, 1886.

DURING the fiscal year ending June 30, the appointments in the 53,614 Post-offices in the country amounted to 22,747, as follows: On resignations and commissions expired, 9,112—increase, 3,908 over the preceding year; on removals and suspensions, 9,566—increase, 8,756; on deaths of postmasters, 587—increase during the year 175; on establishment of new post offices, 3,482—increase, 1,361. Total number of appointments made during the year, 22,747—increase, 13,200.....Most disastrous storm for years in Western Pennsylvania Monday morning; floods, crops ruined or injured, fences, trees and buildings blown down or swept away—loss over $350,000.....Col. Bolton, superintendent of second-class matter in the Chicago Post Office, and Chief Weigher Stewart, were arrested Monday for embezzling about $100,000 of Government money. Receiving, say, 25,000 pounds of newspapers, they charged the publishers full price ($1.00 a pound), and reported to Washington only 15,000 pounds, pocketing in such a case $100. This swindling has been going on for years, and was discovered by inspectors from Washington, whose suspicions were first aroused by Bolton's violent opposition to an examination of his books..... ....The Supreme Court of Rhode Island sustains the constitutionality of the Prohibition laws. .....The Pennsylvania Democratic convention is likely to favor high-license..... .....It wasn't Admiral Worden, of Monitor fame, who died, as telegraphed the other day; but Admiral Warden—a different hero altogether.....There is no prospect of the passage of the Inter-State Commerce bill at this session of Congress.....The Court of Appeals of New York, has adjourned till October without deciding the appeal of ex-alderman Jaehne—three judges were for conviction and three against; while one was absent. ... .Connecticut nominated a straight Prohibition ticket, Wednesday.....Wisconsin, Michigan and Ohio Prohibitionists have done likewise.....West Virginia Republicans favor the submission of a prohibitory constitutional amendment to the people ... ...The House has appropriated $75,000 to pay the Land Office special agents who have been investigating land frauds. A strong movement was made to vote no pay; and an amendment to increase the amount granted to $125,000, was defeated. The bitterest opponents of the measure, and of all exposures of land frauds, have all along been the Congressmen from Kansas, Nebraska, Colorado and Minnesota, and it has been repeatedly very forcibly charged that some of them are interested in the land secured by fraudulent means..... The House appropriated $620,000 for national defences; the Senate has raised the amount to $6,630,000. The increase meets with widespread favor, as a third-rate foreign power could now safely bombard all our sea-coast cities, and exact heavy ransoms from them... .....There's little chance that the Senate will act on the new extradition treaty at this session—no time. A good deal of opposition to the "dynamiter extradition" clause has been developed among the Irish and Irish-Americans. The Dominion Government approved the draft of the treaty before it was finally formulated, and suggested the clause relating to the surrender of escaped convicts. .....Gen. John B. Gordon was nominated for Governor of Georgia, Wednesday, by 322 out of 322, votes on the first ballot. The vote was made unanimous, except two objecters. Gordon's rival, Maj. Bacon, was excessively bitter and begged his followers not to make the vote unanimous.....The Republican Legislature of California, at its extra session which began July 20, has resolved to elect a successor to United States Senator Miller, shelving "Old George" Sheard..... .... Prince Dom Augusto, eldest son and heir of the genial old Emperor Dom Pedro II. of Brazil, is on a visit to this country now, and last Monday made a trip from this city to Coney Island, a watering-place about 10 miles off, on Long Island. On his way back what some think was a burning bomb was found on the boat and thrown overboard; it is generally thought some one was playing a practical joke. District Attorney Martine, however, who convicted the boycotters, and against whom they have made violent threats, was on board, and some think it was intended to blow the vessel to pieces and drown most of the passengers for his special "benefit."..... The trial of the Chicago Anarchists is still "booming," and exposures of their nefarious plans, designs and plotting are being constantly made by "traitorous" confederates and detectives who, in some cases, had been for two or three years trusted members of the Anarchist organization. It is thought the "political pull" of the party (reckoned at nearly 15,000 votes in Chicago) will prevent hanging any; but the imprisonment of several seems certain. .....Senator Blair, of New Hampshire, great on appropriations for pensions and public education, now wants an amendment to the Constitution of the United States prohibiting, after A. D. 1900, the "manufacture, sale, and importation of distilled alcoholic intoxicating liquors."....Oregon pays a bounty of two cents for every squirrel killed, and one man was recently paid for 125,000 squirrel tails which he had collected..... ....The Maine Knights of Labor have elected delegates to support Powderly at the great convention at Richmond, Va., in October.... ... So many outrages on white women and girls have been committed of late by negroes in Comanche Co., Western Texas, that all colored people have been notified to leave the county at once. A few bad men are causing much suffering and loss to innocent darkies... ....Ned Buntline's estate amounts to about $20,000 in farm and personal property. Two wives claim it. He made as much as $64,000 a year by his pen at one time..... ..... Chicago physicians have presented bills amounting to $9,528 for attending victims of the Anarchist slaughter at Haymarket Square at the county hospital..... .. ....Hon. J. A. Chapleau, Dominion Secretary of State, in seeking re-election by the French-Canadians at Chambly, the other day, denounced Riel as a rebel, miscreant and renegade, and met with the fiercest opposition and personal threats of violence. He says he was offered high office and big money bribes to forsake his party and lead the opposition, but that he patriotically refused to be "corrupted." Intense bitterness marks the election—the first since Riel's execution..... Nova Scotia is still insisting on "home rule" and trying to form a confederation of the Maratime Provinces. Some advocate annexation to this country, but the vast body of the people take no stock in the notion .....All along the Northern coast of Newfoundland there is desperate want. The inhabitants, chiefly Esquimaux, depend mainly on fish for a livelihood. For two years the supply has been insufficient; and this year the coast has been blockaded with ice from 20 to 25 feet deep, and fishing has been impossible.....So far as heard from in July the temperature was below freezing point; no crops were put in, no fish caught, supplies always barely enough for winter use, were some time ago exhausted. The number of deaths from starvation—sheer starvation—is variously estimated from 1,500 to 3,500. Some of the settlements have been exterminated; hundreds of bodies will not be found for months, if ever. Winter opens in September; what's to become of any survivers? The coast is not included in the Canadian Confederation; but private Canadians are sending tardy relief, as there are no public funds for the purpose. The distress was known months ago, but not the terrible mortality caused by it. Why doesn't the Dominion settle the starvliugs on its millions of unoccupied acres in the Northwest..... ....What a tremendous amount of attention all the political papers are now giving to the Prohibition movement. Little county and town prohibition meetings are respectfully reported at length by big Dailies that a short time ago had only a few words of ridicule or contempt even for State conventions..... After all the Morrison surplus resolution is likely to be forced through the Senate by outside pressure, perhaps as it passed the House, making $100,000,000 the limit of the cash to be kept in Treasury. The Senate may, however, increase the reserve by $10,000,000 to $20,000,000, on the ground that the $100,000,000 are held as security for the greenbacks in circulation; and that there should be some more reserve to be drawn on in case of emergency .....Judge George A, Jenks, of Pa., has been nominated Solicitor General instead of Goode, of Va., whom the Senate refused to confirm. Jenks was confirmed Friday..... ....With regard to the fishery difficulty with Canada, Secretary Bayard has investigated every case of alleged seizure, and whenever the facts justified such action, demands for redress have been made. The President has appointed counsel for citizens in the Canadian Courts, and has entered into negotiations with the British Government, which, he believes, must terminate in an amicable settlement equally just and honorable to both countries.. .....With regard to the Mexican trouble, Editor Cutting has not been surrendered yet by the Mexican authorities at El Paso del Norte, Mexico. Some doubts are cast on that peremptory demand of Sec. Bayard for his surrender. It is said the Mexican Federal authorities have ordered his surrender; but the State authorities of Chihuahua refuse to obey—just as if Gov. Hill of New York refused to surrender to Canada a prisoner on he order of President Cleveland. Texans are clamoring for war, and Mexicans along the Rio Grande are bitterly hostile; but no sensible man expects anything but a peaceful and friendly settlement of the difficulty. Other outrages by Mexicans in their present feverish state may, however, lead to more serious complications ....

FOREIGN NEWS.

SATURDAY, July 31, 1886.

LORD SALISBURY has formed a strictly Conservative Cabinet, as the leaders of the Liberal-Unionists have all declined to take office, though Lord Hartington was offered the position of Prime Minister, Salisbury being willing to serve under him as Minister of Foreign Affairs. It is thought a strong Cabinet by its friends, and, of course, a weak one by its enemies. Impartial critics say it is quite strong in parts and weak in others; but fairly strong as a whole. Here it is: Secretary of Foreign Affairs, the Earl of Iddesleigh (better known as Gathorne-Hardy); Chief Secretary for Ireland, Sir Michael Hicks-Beach) Chancellor of the Exchequer, Lord Randolph Churchill, who, by virtue of his appointment, becomes the recognized leader of the Conservative party in the House of Commons; Secretary for War, Rt. Hon. W. H. Smith; First Lord of the Admiralty, Lord George Hamilton; Lord High Chancellor, Baron Halsbury; Secretary for India, Rt. Hon. Frederick Arthur Stanley; Prime Minister and First Lord of the Treasury, the Marquis of Salisbury; Lord Lieutenant of Ireland, the Marquis of Londonderry..

AGRICULTURAL NEWS.

SATURDAY, July 31, 1886.

PRESIDENT CLEVELAND referred the Oleo Bill to Attorney-General Garland for his opinion as to its constitutionality. Garland has returned it, but his "opinion" is not definitely known. He is believed to have said that it is not unconstitutional, but that he is strongly opposed to it as a matter of policy and justice. So are nearly all the Southern Senators and Representatives, among others the two Senators from his State. Some say the President will sign it, as he is disinclined to antagonize the demands of the 8,000,000 farmers of the country. Others say he will veto it; as his party as a whole, is opposed to it, and vast corporate interests are pressing him in that direction. Others say he will neither sign nor veto it. In that case it will become law at the end of 10 days after its passage by Congress, unless Congress adjourns before the end of that time. If he does not sign it, its friends in the Senate and House will prevent the adjournment of Congress before next Tuesday, when it will become law without his signature. Farmers are pouring in upon the President petitions in favor of it by thousands. We shall have something to say about the Bill, editorially, when final action shall be taken on it..... ....A special dispatch from Fort Worth, Tex., says many exaggerated reports have been sent out from North and West Texas in regard to the suffering of cattle from drought in Western Texas. Unusual droughts have existed in the different sections of West Texas, but these have all been broken by good rains within the last two weeks. Moreover, it is said stockmen, to avoid enormous losses from excessive drought, drove their cattle to better sections. This whole report seems to us to be written for a purpose, and meant to deceive. It is against all previous reports from widely separated parts of the State, and also against the burthen of other reports received within the last two days. There's a "nigger in the fence" here somewhere..... Abundant rains have put an end to the drought in Colorado and to no end of wrangling among farmers and stockman, irrigation companies and riparian land-owners. Probably the next legislature will have to pass laws or provide for a constitutional amendment regulating, once for all, the subject of irrigation—a paramount one in that State where agriculture, owing to the light rainfall, is dependent nearly altogether for success upon irrigation .....The crofters (small tenant farmers) of Tiree Island (one of the inner Hebrides), Scotland, have driven away a newly-settled, large farmer, whose land they wished to divide among themselves, and frightened away a squad of police sent to back him up. A man-of-war with a force of marines is on its way to the Island to "make short work of all opposition."..... ..... It is reported that thousands of cattle and sheep will be brought from Montana into Dakota this Winter, as the grass on the ranges has been entirely burned out. Arrangements have already been made to winter 150,000 head of cattle, and stockmen are going into Dakota every day in search of feed for their stock.....Sixteen head of cattle infected with contagious pleuro-pneumonia were killed, the other day, near Lancaster, Pa. ... .The Audubon Society is growing and new branches are rapidly being formed. The members pledge themselves not to kill or capture any wild bird not used for food, not to disturb or destroy the nest or eggs of any wild bird, and not to make use of the feathers of any wild bird as ornaments of dress or furniture..... .... Watermelons have been shipped to Chicago in such quantities that commission dealers cannot realize enough on consignments from Florida to pay freight charges ... ... The Secretary of the Illinois Board of Agriculture has received the medals forwarded by the Clydesdale Horse Society of Great Britain to be awarded at the Chicago Horse Show in September.....A dispatch from Little Rock announces that a refreshing rain has fallen in all sections of Arkansas, after a drought of six weeks, insuring good crops of corn and cotton..... ....

The Fountain of Youth.

IN all the searches for the fabled fountain of youth there has been disappointment in the final result. This has been more or less keen, according to the state of health of the seeker. But *modern scientific research has found a real "fountain of youth."* In Compound Oxygen the old ideal so long sought for has been found to be attainable. One who has tested its value writes from Waukan, Wis.: "I sleep better; *dyspepsia* is less troublesome, and I think I can say my heart is better. I am stronger, and I am losing that worn and haggard look; perhaps I may say *I am growing young again. It must be that Compound Oxygen is the fountain of youth.*" Another writes from Clinton, Mass.: "It has given me so much strength that *I feel like a new person.*" A clergyman at Queen City, Mo., writes: "My wife has used your Compound Oxygen with the best of results. Her cough is not entirely removed yet, but with that exception she has become *the strongest and healthiest woman of her age in this community.*" The editor of *The New South*, W. H. Worthington, of Columbus, Miss., says:

"You will doubtless remember my getting your Compound Oxygen for my mother (who is *very aged*) in February or March of last year, and its happy effect upon her. When I wrote you my mother was very low. When she commenced taking the Treatment she began at once to improve and this improvement was steady. She is now in good health. Last week she made several visits to her friends, walking several squares. Her restoration to health from the use of Compound Oxygen has attracted considerable attention in this section."

Curiousity as to this remedy may be fully gratified by any one who will take the trouble to write to Drs. STARKEY & PALEN, No. 1529 Arch Street., Philadelphia. They publish a brochure of nearly two hundred pages, entitled *Compound Oxygen—Its Mode of Action and Results.* This will be sent, post-paid, to any address on application.—*Adv.*

Crops & Markets.

SATURDAY, July 31, 1886.

THERE is a great deal of complaint at Chicago about the inspection of the new winter wheat. It is claimed that considerable wheat which ought to pass as No. 2 Red is inspected as No. 2 Turkish, and a loss of two to three cents caused thereby. Receivers say that the harvest having been completed during the clear hot weather, the kernel is exceptionally hard and dry, even the soft varieties being almost as hard as California samples. Exporters and millers agree that this is not detrimental to its value, but the inspectors place it in the same grade as Turkish wheat, which was intended to include the flinty varieties. Conferences between the parties interested and the Chief Inspector have not so far tended to remedy the trouble, which is drawing considerable of the trade from that city.

A telegram last Tuesday from Canajoharie, N. Y., in the center of the hop-growing region, said: "The last ray of hope entertained by the hop growers throughout New York State vanished this morning. During the night a heavy rain occurred. The growers thought that this would have a good effect, but, instead, yards which yesterday appeared green and healthy are now black and utterly ruined. Many growers destroyed their yards a week ago, and their example will now be followed generally."

A telegram from Cedar Rapids, Iowa, Tuesday, says that most of the small grains had been harvested with better results than had been anticipated. Wheat is better in quality than it has been before for 10 years, and the yield is equal to last year's crop. Hay in many places is burned, but in others is of superior quality, but only about 80 per cent. of last year's yield. Oats yield well, and none is poorer than best grade No. 3. Barley and rye also

good, but flax is not more than three-quarters of a crop. No rain had fallen in many places for 11 weeks, but a light rain fell Monday night west and north, doing the corn much good. Corn had stood the drought remarkably well.

Reports of the damage done to spring wheat in the Northwest by the protracted drought, still vary so much that it is very evident many of them are made up for speculative purposes. It looks now, however, as if the injury since July 1, the date at which the RURAL report was made, would amount to about 15,000,000 bushels, so that the aggregate spring wheat crop is likely to be about 125,000,000 bushels, instead of 140,000,000 as indicated by the condition on July 1, according to our reports. The crop is very uneven, being in fair condition in some places, and nearly utterly ruined in others. Corn, too, is reported very uneven in Michigan, Illinois, Wisconsin, Iowa and Nebraska, and the probability of injury to it has helped to stiffen prices. Wednesday there was a corn panic in Chicago, and prices jumped up 4c. a bushel. Reports of very serious damage to the crop, especially in the great-corn-growing States, are multiplying. Some say the crop is "ruined;" all say the injury is great. Potatoes appear to be in bad condition nearly everywhere in the West, except in Minnesota. In parts of Wisconsin cattle have been given feed for over a week past, owing to the poverty of the pastures. Fruit crops of Illinois, Michigan and Wisconsin very promising.

It is estimated that the grain ruined by Friday's hail-storm about Portland, Dak., will aggregate 750,000 bushels, which at the present price means a loss of $450,000.

The July cotton report to Bradstreet's shows that the late heavy rains in the Atlantic States, Alabama and Mississippi, have left the plant in a condition well towards bad, as against good at a like period last year. The crop is equal to last year's in other States except Louisiana, where it is fair only. The weather is hot and dry throughout the cotton belt, a condition which must operate unfavorably if long continued.

Delaware and Maryland Peninsula peach growers will begin marketing their crop in less than a week. Reliable authorities put the crop at about 3,000,000 baskets—somewhat less than an average crop, but enough to meet the demand. Some early kinds are now being sold, but the quality is poor. Some ripened prematurely through unhealthy condition of the trees, are bringing better prices than prime fruit later on. Beatrice, Louise, Early Rivers, Amsden's June, Alexander and Waterloo are expected in a day or two. Nearly the entire yield of these varieties has been sold for $1.50 a bushel, which is considered a high figure for these sorts. The peach season here is usually inaugurated when Throth's Early is ripe. This and Crawford's Early are highly prized for eating, and Crawford's Late for canning and preserving. Oldmixon and Smock are also favorites. The system of "exchanges," now established through nearly all the fruit-growing section, greatly facilitates shipment and prevents the overstocking of the markets. Representatives of the big houses in the large cities are already on the ground, constantly watching the ripening fruit. Generally the dealers buy outright instead of securing goods on commission. The Pennsylvania R. R., by its system of fast freight deliveries has extended the market throughout all the Eastern and Northern cities and as far west as Chicago. The market is further kept up by innumerable evaporators and canneries in the peach belt, and these will use so many that peaches, it is thought, will not go below 30 cents per basket. It is thought that with all these means of selling the fruit, the days of low prices and glutted markets are at an end. This has so encouraged growers that many more young trees have been set out in the Peninsula than ever before, and some expect the area will be doubled next year. The dismal failure of profit from small fruits of late, owing to over-production, will cause nearly all the land to be set to peaches. Peach pluckers expect to earn $3 to $4 a day, and are flocking to the peach section.

The very latest:—Earlier reports as to damage to the spring wheat crop are believed to have been exaggerated, and Dakota and Minnesota are now thought likely to yield over 45,000,000 bushels. The Wisconsin yield is better than expected. Heavy receipts of winter wheat and moderate export demand, hold quotations in check. The drought West and Northwest has damaged the Indian corn crop to some extent, and in such localities general trade is checked. Recent local rains have improved the prospect some. Special telegrams to Bradstreet's place the total California hop yield at 40,000 bales. The Louisiana rice crop is expected to be of fine quality, and to reach 800,000 sacks, and the Louisville tobacco market is firm inasmuch as the crop needs rain and stocks are smaller. The tobacco crop in Chemung Co., N. Y., (a heavy tobacco-growing section) was greatly injured by storms, Thursday.

MARKETS BY TELEGRAPH.

SATURDAY, July 31, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is ⅞c. lower; No. 2 Spring, 1⅜c. lower. Corn, 4¼c. lower; Oats, 3c. lower. Rye, ⅛c. lower. Barley, 6c. lower. Flaxseed, 5½c. lower. Pork, 30c. higher. Cattle, from 10c. to 25c. lower. Hogs, from steady to 25c. higher, according to grade. Sheep, a slight rise, except in Texans which, have dropped from 50c. to $1 a head. Lambs from 25c. to 50c. higher.

WHEAT active; Sales ranged: July, 73¾@76c; August, 74½@75¾c; Sept., 76¼@77½c; No. 2 Spring, 74c. CORN.—Active; cash, 41½c; July, 42¾@41¾; August, 43¾@45¾c; September, 45¾@47½c. OATS.—Weak; Sales ranged: Cash, 28c; July, 28c; August, 28@29c; September, 29¾@30¾c. RYE.—Quiet; No. 2, 53½c. BARLEY.—September, 61@61¾c. FLAXSEED.—No. 1, $1 12. MESS PORK.—Active, Sales ranged: Cash, $9 80@9 85; August, $9 77½@9 91½; September, $9 85@10 10. LARD.—Firm; sales ranged: Cash, $6 65@6 67½; August $6 65@6 70; September, $6 70@6 77½. Short Ribs.—Cash, $6 17½. Boxed Meats.—Dry Salted Shoulders, $6 10@6 15; Short Clear sides, $6 60@6 65. CATTLE.—Market dull; Shipping steers, $3 50@5; stockers and feeders, $2 40@3 70; cows, bulls and mixed $1 50@3 60; bulk, $2 50@2 90; through Texas steers, $2 50@3 85. HOGS.—Market weak, rough and mixed, $4 20@4 90; packing and shipping, $4 75@5 20; light weights $4 20@5 05; skips, $2 75@4 00. SHEEP.—Market slow; Natives, $2@4 50, Western, $2@3 40; Texans, $1 75@2 90; Lambs, per head, $1@5.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 1¼c. lower. Corn, 4c. higher. Oats, 1c. lower. Rye, 2c. lower. Barley, steady. Butter, unchanged. Pork, 15c. higher. Cattle, from 15c. to 45c. lower. Hogs, all classes from 15c. to 30c. lower, except "heavy," which are from 10c. to 20c. higher. Sheep, steady.

WHEAT.—Dull; No. 2 Red, Cash, 75@75⅛c; August, 75⅛c; September, 77¼c. CORN.—Active; No. 2 mixed Cash, 38⅝@41¼c; August, 41c; September, 43¾c. OATS. Weak; No. 2 mixed, Cash, 27¾@28c.; August, 27¼c; September, 28¾c. RYE, 51c. BARLEY.—No. 3 Spring, 45c. BUTTER.—Creamery, 16@20c; dairy, 10@15c. EGGS, 8c. FLAXSEED.—$1 05. HAY.—Timothy, $12 00; Prairie, $5 00. PORK—$10 40. BULKMEATS.—Long clear, $6 20; short ribs, $6 30; short clear, $6 45. LARD.—$6 25. Receipts.—Flour, 3,000 bbl; Rye, 2,000 bush; Barley, 1,000 bush. CATTLE.—Market active; Good to Choice Native Shipping Steers, $4 50@4 75; Common to Fair, $3 50@4 40; Butchers' Steers, $3 25@4 25; Cows and Heifers, $2 25@3 50; Stockers, and Feeders, $3 25@4 25; grass Texans, $2 25@3 85. HOGS.—Market firm; Lights, $4 50@4 85; Packing, $4 30@4 85; heavy, $4 90@5 15. SHEEP.—Market firm at $2 25@3 75.

BOSTON.—GRAIN.—Corn.—Steamer mixed at 50½@51c; steamer yellow is scarce and quoted 52c. per bushel. OATS.—Are in fair demand and firm, fancy clipped are particularly firm at 48@49c; sales of No. 2 white at 42@42½c. as to location, and No. 3 white, 40¾@41c. per bushel. Rye is quiet at 58c. per bushel. Bran, $14@15 00 for Spring, and $15 50@15 75 for Winter; Fine Feed and Middlings at $15@18, and Cotton Seed Meal at $23 on the spot, and $21 75 per ton to arrive. HAY AND STRAW.—Market for hay has been firm at $17@18 per ton for choice and fancy, $14@17 for fair to good, $13@16 for fine, and $9@13 for poor and damaged. Western choice, $16@17, do fair to good $14@15. Straw.—Rye straw is held $19@19 50 for choice, and $14@18 for common to good. Swale hay at $10@11 per ton. Oat straw at 10@11 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra, 20c; do. extra firsts, 18@19c; firsts, 16@17c; Western creamery, $17@19c, for extra firsts to extra; firsts, 15@16c; Northern dairy, 15@17c. for Vermont extra firsts to extra; firsts, 14@15½c; seconds, 12@13c; Western dairy, 12@13c for firsts; seconds, 9@11c; imitation creamery, 11@15c for extra firsts to extra; ladle-packed, 9@12c, for extra firsts to extra; firsts, 8@9c; seconds 7@8c; grease, 3@4c. NEW CHEESE.—New York and Vermont extra, 8@8½c; do. do. firsts, 7@7¾c; do do. seconds, 4@6c; Western extra, 7¾@8c; do. firsts, 6¼@7c. EGGS.—Cape and near-by, per doz. 19c.; Eastern extras 17c; do. firsts, 16c; Northern firsts, 16@15c; Western firsts, 15c; Provincial, 15¼@16c. BEANS.—Choice Northern hand-picked pea, $1 75@1 85 per bushel; do. do. New York, small $1 60@1 70; do. do. screened, $1 15@1 30; medium choice, hand picked, $1 50@1 55; do. do. screened, $1 15@1 25; Yellow Eyes, improved $1 50; do. choice flats, $1 25@1 40; Red Kidneys, $1 60@1 70; Canada pea, 65@95c. per bushel for common to choice; green peas, Northern, 90c@$1; do. Western, $1 15@1 20. POTATOES range at $1 75@2 25 per barrel for new.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 31, 1886.

STATE OF THE MARKET.—As compared with cash prices last week, flour is 15c. higher; No. 2 Chicago wheat, ¼c. lower; ungraded red, 3c. lower; corn, 4c. higher; oats, steady; pork, 12½c. higher; butter, 2@2½c. higher; cheese, ½c. higher on best grades; poultry steady; fruits and vegetables steady.

For the Young.

I NOTICED a deformed leaf the other day. It was all out of shape, all twisted and crowded. It seemed ashamed of itself, hanging down and not standing up with the others. When it was young and growing, a spider had thrown a web over it and drawn it together. It had been drawn in and cramped so that it never got a fair start. The result was that it never had a chance to grow properly, and here it is now, all out of shape. Some men I know grow up in about the same way. They let laziness or some other fault put a web over them, and before they know it they are tied up for life. There are plenty of spiders all around you that would be glad to tie you up. They are all the time looking out for smart boys and girls that they can put their webs upon. Look out for them; keep out of their way by doing what you know is right. Whenever you do something that you know is wrong, one of these spiders gets a good bite at you.

How many of our boys and girls have to be told to "sit up straight?" Some people never sit in a chair at all. They just rest on the shoulders and on the end of the spine. That throws the back all out of shape. We have lots of things about us that will fail if we do not attend to them. The teeth and the eyes are most important and they can be saved or destroyed, just as we see fit. Boys and girls who do not want to have broken or false teeth some day, must remember to keep their teeth clean. Good tooth-brushes are cheap and they should be used every day. It doesn't take much time to brush the teeth, but the time so spent saves many an hour of the toothache and much trouble at eating. Many a good pair of eyes have been weakened by reading in the dark or in a bad light, or reading while the eyes felt tired. I don't think any of us will look well in spectacles, so we had better take care of our eyes now.

WHEN I was a boy I never liked to have my hair cut. The cutting was not as pleasant as it might have been. The old man who cut hair in our village could not see very well, and sometimes he would get so interested in his talk that he would forget what he was doing, and the first you knew the shears would come up against your ear. His shears were dull too, and they would pull pretty hard. Sometimes when he was in a great hurry he would take a big tin basin he had, clap it over my head and just trim off the hair that came below it. You can imagine what a looking head I had then. It never seemed to matter, however, for nobody cared much how the "boy" looked. Whenever I wanted to let my hair grow, they would tell me a story about an old farmer who lived a good many years ago. He was mowing one day, and after using his whet-stone he put it back of his ear and forgot where he put it. He blamed everybody for losing it. His hair grew long and covered his neck and ears, but he never would have it cut, until one day he was taken sick, and the doctor came and cut his hair. There behind his ear they found that whet-stone It is a foolish story isn't it?—and yet did you ever know people to do foolish things, blame others for doing them, and at last have the proof of their own mistake come right back to them? I have. It is a good plan to see what we are doing.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(*Continued.*)

"HOG! oh hog! you hog!"

Mr. Ezra Greening, the school inspector of Clay Valley township, still continued his conversation with the occupant of the pen. My ideal school system had been badly shaken during the journey from town, but it did not stand completely paralyzed till I walked up to the great black patch that appeared to stand guard while its owner bent over the pen.

Just as I came near, the great sow within the pen rose lazily and came forward to eat her dinner. This desirable object accomplished, Mr. Greening appeared free to devote his mind to educational purposes. He slowly straightened himself and the patch cautiously turned about until it was hidden from view.

Mr. Greening looked like a horse in the face. He had the large nose, bulging eyes, wide mouth and comparatively narrow forehead of that animal. Still there are horses and horses. Some have more intelligence than others. What they lack in intelligence they make up in obstinacy, and the ability to render their companions uncomfortable.

A shock of red hair stood up about the head, nearly lifting the hopeless hat in its efforts to deceive the observer by pretending to add to the size of the head. A blue flannel shirt, a red vest, brown overalls, and great boots appeared to be the costume in which education was clad in Clay Valley. The inspector held a large wooden paddle in his hand which he waved vigorously as he caught sight of me.

"Go 'way!" His voice was thin and high. "Go 'way! I don't wanter buy no book. I'll lay a hog you can't sell me none. I aint gut no money, crops is bad, sickness in the family, eyes is givin' out an' I ain't gut no time fer ter read noway."

I made haste to assure him that I was no book agent, but had come for an examination. It seemed hard to convince him that I was not armed with a "sample copy." He examined me critically, holding the paddle before his face to shade his eyes from the sun.

"You look jest like a book peddler, I declare ye do. We've jest shifted school books. I've gut me a Receipt book, a Lives of the Presidents an' a History o' Bible Times, an' aint read none of 'em. They aint no market here at all."

It was a long time before I could convince him. I do not think he was fully satisfied during the entire conversation. I think he fully expected to see me produce a "sample copy" and proceed to tell my "story." No doubt that fact tended to make my examination shorter.

"Gonter teach school to Bear Crick be ye?" He asked after I had made my errand known to him. "Sorter rough place over yonder. Plow them big boys is whales. Licked the last teacher an' drug him out an' jumped on him. A feller to teach in that deestrict orter be jedged by his muscle. Folks over there seems ter sorter get the bit betwixt their teeth and all pull sorter cornerways. They fite by sorter doggin' the boys onter the teacher. When one side quits, 'tother picks it up. Where ye frum?"

"I came down from the agricultural college," I answered a trifle doubtfully. This man seemed the perfect picture of the examining ogre we had come to dread.

"Oh, ye did? Wall, then, I 'spose ye must be putty well posted. Jest step up here an' I'll ask ye yer fust question in 'rithmetic. What do ye figger thet hog'll weigh? I'll lay they ain't another such in this county."

I saw my opportunity at once. There are various ways by which the heart of man can be reached. The avenue in some instances lies through a hog. I walked up to the pen and examined the lazy animal, and made a few figures on my note book before rendering a report.

"Well, sir, that is as fine a hog as I have ever seen. She can't weigh an ounce less than 400 pounds."

A smile of pleasure spread over the examiner's face at this answer.

"Sho—you ain't bad on figgers, be ye? Like enough she dooes weigh that much, but I wouldn't a put her down fer more than 375. Walk in! walk in!" and he put down his paddle and led the way into the house. From the expression on his face I was well satisfied that I had made a "10" on the first question. Once inside the house Mr. Greening proceeded to don a rusty black coat and to place a pair of spectacles on his nose. The coat was too tight for him and the spectacles sadly pinched his nose, yet he seemed to feel that the examination would never be a success without them.

"Gonter teach to Bear Crick, be ye? Now you've got quite a chore afore ye. I expect ye'll go back ter college with quite an appytite fer stayin' there."

"Why, what is the matter with it?"

"Oh, deestricts all right 'nuff I 'low, if a feller sorter watches an' keeps things sorter evened up. The gineral run o' teachers don't seem ter fit worth a cent. Putty strainin' place, 'cause everybody gets a holt on teacher an' yerks him all ways. A feller can't get no chance fer ter pull back, an' thar he is."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I am a little boy 10 years old. I live in Florida. I came from Tennessee nearly two years ago. We have a nice place here, on the bay, in sight of the Gulf of Mexico. We can stand in our yard and see the white caps of the Gulf. If you ever come to Florida you must visit us. We have nice fruit here; we have ripe peaches now. The Peento peach does well here. I shipped some tomatoes this year. I want to ship some egg-plants this Fall to your City; can you send me a reliable house to ship to. I have a nice garden coming on. I help my Mamma. I have two sisters and a little brother. If you come to see us I will give you all the tropical fruit that you can eat. Your nephew, MANSON T. DYE.

Clear Water, Fla.

[You may be sure that I will see you when I come your way. I will write about the commission house.—U. M.]

DEAR UNCLE MARK: I thought you all would forget me if I did not write before long. There are many raspberries this year here. Uncle Mark, I would like to have you see our flowers. Do you love flowers? We have eight canary birds and four small ones just hatched. We have eight horses, six little guineas and seven ducks. We have a large pond in our woods with carp fish in it. I don't think I would like to live in the city these warm days. Here in the country we can go in the woods and lie on the green carpets and hear the birds singing in the trees over our heads. We live a mile from town. I don't believe Uncle Mark is very old. I read the Y. H. C., every week. Your niece

Alexandria, Ohio. ADAH.

[I love flowers. I am older than you think. U. M.]

DEAR UNCLE MARK: I would like to join the Y. H. C. Father takes the RURAL. He says he could not get along without it. I have four brothers besides myself; four of us go to school Father raises lots of celery to sell. We have lots of strawberries. Father has a large Seedling strawberry that looks like the picture of the Jewell strawberry we see in the catalogue. Father gave me a little piece of ground, and I raised some watermelons and muskmelons. I sold my largest watermelons for 25 cents each. My muskmelons were nice. We are all busy in the Summer. Father has been to Florida, to a place called Palmasola, on the Gulf coast. He was there three years ago. He stayed there a year. He says it is a nice place to spend the Winter. Insects are bad in the Summer. Oranges and vegetables won't grow everywhere there. Brother Harry is going to write and tell you how father bleaches his early celery for market, and the kind's he uses. I am 10 years old.

Dover, N. J. WILLIE BYRAM.

[We want to know all about the celery, and shall expect that letter.—U. M.]

DEAR UNCLE MARK: I planted the Garden Treasures and they are growing nicely, some of them are in bloom. We have a very nice garden this year. We have a splendid pink. It is dark red and very double—had 49 flowers on at one time. I think the seed came with the Garden Treasures. Will some of the Cousins tell me how to keep rose bushes from freezing down in the Winter? I have one that I cover with straw, but it always dies above the ground. I think Uncle Mark is right about raspberries being the best of all small fruits. We have bushels of them here, and our cellar is always lined. We have about 800 cauliflowers set out. We would like to have you come and help eat them. Mamma thinks Ella Turner's Mamma and herself would agree, for Mamma is a temperance woman too. I have to stop for I have to help get dinner ready. EMILY COCKERAM.

Menomiuee, Wis.

[Let us hear from our rose friends.—U. M.]

DEAR UNCLE MARK: I would like to join the Y. H. C. I am a little girl eight years old. I have a little flower garden. My mother gave me a few of the Rural Garden Treasures, but I did not have luck with them, and one Bird Cantelope seed, but it did not come up. I have six brothers and three sisters. We have three cats and two dogs. We have eight milch cows. I have 10 little chickens. My Papa has five working horses and four colts, and nine yearling calves.

Dubuque Co., Ia. EFFIE A. BORN.

DEAR UNCLE MARK: As we all want to crowd that advertising column off of our page, I will add my mite. I received the package of sweet peas that you so kindly sent me. I planted them April 23, and they came up real well and are now in bloom. The Garden Treasures I planted April 21. I spaded the dirt all up, and then I went to the wood-pile and got dirt from under the wood; then I sifted it through an old coal sieve and planted my seed. They came up slowly, but now they are in bloom. We have pink and white candytufts, ragged sailors, poppies, zinnias, marigolds, phlox, and many others of which I do not know the name. The blackberries are ripe now, but we have to look sharp for them, or the city folks will come up very early in the morning and get them. My sister-in-law and I started out before six o'clock the other morning, but we did not get many, because it began to rain and we had to scamper home.

Your niece, BESSIE HOPE.

Perth Amboy.

[April 21 is my birthday. The city folks like berries.—U. M.]

DEAR UNCLE MARK: I have been reading the letters from the Cousins and enjoy them very much. I am 11 years old. I live about a mile from Topeka. My Father and Mother are dead, but I live with some nice Christian folks. I have one pet, a cat; his name is Daniel. He is maltese and white; and I have two dolls. I have a garden of flowers. Your affectionate niece, LUCY G. PIERSON.

[I am glad you have a good home.—U. M.]

DEAR UNCLE MARK: I have sent the picture of the trap that I think is the best to have on the farm. It catches rats, mice, gophers, squirrels, etc. Our cat (for that is the name of the trap) is well trained. She comes in the morning for some new milk, and as soon as she has as much as she wants she goes off until noon; then she comes for her dinner. At evening she wants milk again. We have a very nice vegetable garden this year. We live where we can see the steamers go over to Monterey Point, and the cars go by. The grain is ready to thrash now. One thrashing machine has started to work and there are two more that have not commenced yet. I would like to join the Y. H. C. My brother and I have a watermel on patch; the vines are very young yet. I will write again and tell you how they get along.

From your niece, LIZZIE SMITH.

Santa Cruz Co., Cal.

[The picture is very well drawn. She is a fine trap certainly. How she must make the rats and mice run.—U. M.]

DEAR UNCLE MARK: I am a girl 11 years old. I have been taking music lessons five months. I am improving very fast. Grandpa has sent me the RURAL for two years. I received the seeds and planted them; they all came up but the flower seeds. I have no brothers or sisters. All the pets I have are two canary birds. We are living in Kansas near Walnut. The timber surrounds us on the north and west. We live one mile from the school house. I went to school the last term seven months and did not miss a day. I studied reading, history, grammar, arithmetic, writing, geography and spelling. I got the prize for attendance, a large book, Swiss Family Robinson. HATTIE M. CULBERTSON.

Crawford Co., Kas.

[That is a good book. I hope none of us will ever be cast away as that family were.—U. M.]

DEAR UNCLE MARK: I wish to write to you about my rabbit. He was black. My uncle gave him to me four years ago. I had a small park for him, where I kept him for three years. When he wanted to come out, he would burrow in the ground till he got outside of his park, then he would dig out. I let him live in the yard almost a year, but he got so destructive in our flower garden that, as the last hope to keep him, I chained him with a long, very light chain, and put him where he had good shade, grass, and water, and watched and fed him often. He seemed very well contented and lively, but Sunday afternoon when I went to see him he was dead. He was to all appearances quite well that morning. Now, do you think he grieved himself to death? I think he was quite old, as he was getting some gray.

Pentz, Cal. ALICE SNYDER.

[It may be that he did die of grief. The chain must have seemed harsh enough to him. I am glad you wrote about him. We must have more to say about rabbits. They make good pets.—U. M.]

PERSONALS.

SENATOR BLAIR is a total abstainer from intoxicating drinks, but is a good smoker of 25-cent cigars.

PUBLIC PRINTER ROUNDS has bought the Omaha (Neb.) Republican for $100,000, and will soon resign his position at Washington.

MRS. CLEVELAND says the White House is "an awfully nice place to keep house in," and every woman in America agrees with her.

MRS. FOLSOM, the President's mother-in-law, is a guest at the White House. She arrived Wednesday morning and will remain several days.

REPRESENTATIVE RANDALL smokes a cigar now and then to "keep company" with his friends, but the process seems very distasteful to him.

JOHN M. BRUNSWICK, the head of the greatest billiard-table factory in the world, expired Sunday, at Cincinnati, of heart disease, in his 67th year.

EX-GOVERNOR WARMOTH, of Louisiana, is visiting his boyhood's home at Salem, Ill. It is said that he now has more than $1,000,000 invested in sugar interests.

MRS. GRANT is about to send Thomas Murphy, once Collector of the port of New York, but now sadly reduced in circumstances, the amount of his contribution toward the purchase of the Elberon cottage.

JOHN RUSKIN has persistently overworked himself, in spite of the warnings of his physicians and the entreaties of his friends, during the late years of his life. He is afflicted with a form of disease which runs into temporary insanity.

PRINCE FUSHIMI, the heir-apparent to the throne of Japan, is on a visit to this country, after spending a year in Europe—on a tour of sight-seeing, pleasure and instruction. The future Mikado of Japan is dividing public notice with the future Emperor of Brazil.

GEN. CLINTON B. FISK, the Prohibition candidate for Governor of New Jersey, says he is for organizing a Prohibition party that will fight a consistent battle for Prohibition this year and every coming year until the battle is won, if such a battle can be won.

"I NEVER," Senator Ingalls is quoted as saying, "did a lick of work until I had received a thorough education. My father and mother supported me until I was quite able to support myself. I belonged to the Brahmin class of New-England and am a sample of genuine Yankee training."

THE Prince of Wales, as future head of the Established Church, is sharply scored by the English Churchman for a recent Sunday dinner he gave to 40 guests, followed by a variety show, at which Japanese jugglers exhibited and a string band played, "carefully avoiding sacred music."

A SON of Senator Beck, of Kentucky, is one of the prominent candidates for Governor of Wyoming Territory. He has started for Washington to press his claims, as against Capt. Baxter, of Cheyenne, Mr. Holiday, of Laramie, and ex-Delegate Post, of Cheyenne—all seeking the place.

DR. GIONANNI SUCCI, the African explorer, claims to have made a most remarkable discovery. He has turned up in Africa a liquor which renders the human body independent of food and drink. It is said that Dr. Succi, after drinking a few glasses of this wonderful beverage, fasted for 10 days.

THE Prohibitionists of Michigan are making much ado over the fact that in the new private car of Gov. Alger wine lockers have been built. They aver that this is a slap in the face of the temperance people of the State, without regard to party, and that it will lose the Republican party thousands of votes.

THE unlucky number figured conspicuously in the career of Richard Wagner. Born in 1813, he died after 13 years of married life on Feb. 13. On March 13, 1861, his opera "Tannhäuser" was hissed in Paris. The number of letters forming his full name is 13, and his royal protector, Ludwig II. of Bavaria, was drowned on the 13th of June last.

MR. BEECHER is lecturing industriously in England. His first appearance at Bristol attracted a rather small audience to the hall; but one of the principal London journals did justice to the lecturer: "Mr. Beecher's magnificent presence, the mobility of his face, the modulation of his voice, his splendid diction and original thought, combined to make the man greater than the occasion."

W. M. EVARTS, lawyer, was bitterly opposed to the New York oleomargarine law, and argued against its constitutionality before the courts; W. M. Evarts, U. S. Senator and aspirant for the Presidency, strongly favored the National oleomargarine bill, and argued for its constitutionality before his fellow Senators. The points involving the constitutionality of both bills are substantially the same.

THE GREATEST OFFER EVER MADE TO SPORTSMEN. A FINE IMPORTED DOUBLE-BARREL BREECH-LOADER with Outfit only $12.00.

WARRANTED HANDMADE, WILL KILL AT 100 YARDS.
We have just purchased AT A GREAT SACRIFICE from a LEADING NEW YORK GUN IMPORTING FIRM (who have recently failed) their entire stock of the well-known and standard "BELDEN" DOUBLE BARREL BREECH-LOADING SHOT GUNS, AS ABOVE DESCRIBED. It is equal in every respect to a COLT, PARKER or REMINGTON for brilliant execution AND OTHERWISE. As we bought a large number, we have decided to offer a LIMITED NUMBER at only $12.00, each, UP TO DEC. 15, 1886 (for the purpose of introducing them more thoroughly in the United States). AFTER DEC. 15, we shall charge the REGULAR RETAIL PRICE of $26.00. SPORTSMEN AND OTHERS can now lay aside their muzzle loaders and secure this most SUPERIOR BREECH-LOADER at the UNPARALLELED LOW PRICE of $12. The Barrels of the "BELDEN" AS OFFERED BY US are made of the finest Sheffield Steel, and each Gun is so BRANDED, besides we will send a GUARANTEE with each one. NO OTHER FIRM WILL DO THIS. Upon receipt of part of the amount, to show good faith in ordering and to cover us on Express charges, we will ship C.O.D. by Express, with privilege to examine before you accept it, or if the full amount of $12.00 is sent with order, we will send A CARTRIDGE BELT FREE and 25 Shells with each gun. ORDER NOW. CUT THIS ADVERTISEMENT OUT, to save confusion, AND RETURN WITH YOUR ORDER. This advertisement will not appear again, and it will be a very long time before we will ever again be able to make such another great and most ADVANTAGEOUS OFFER. Nothing gained by correspondence, as the Gun is fully described above. No Catalogue. Money returned, less Express charges, if it is not as represented and satisfactory. AT $12.00 IT IS THE BARGAIN OF ALL BARGAINS. Complete Set of Reloading Tools only $2.00.
Call on or address, THE BELDEN AGENCY, 9 West Broadway, NEW YORK.

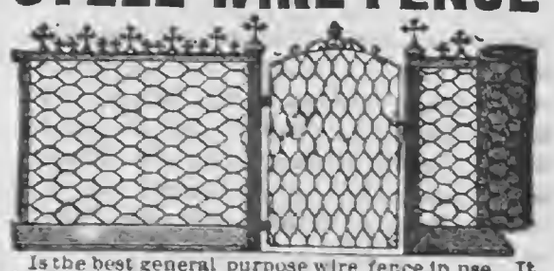
SEDGWICK STEEL WIRE FENCE



Is the best general purpose wire fence in use. It is a strong net-work without barbs. Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. The Sedgwick Gates made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working all-iron automatic or self-opening gate, and the neatest cheap iron fences now made. The best Wire Stretchers, Cutting Pliers and Post Augers. For prices and particulars ask Hardware Dealers, or address, mentioning paper,

Humorous.

A WOMAN never will be "the oldest inhabitant." She wouldn't admit it.

"WHAT would a woman do without a looking-glass?" is asked. Use another's. You can't stick a woman as easy as that.—*Chicago Ledger.*

MARRYING a woman for her money, says a philosopher, is very much like setting a rat-trap and baiting it with your own finger.—*Church Press.*

LITTLE NECK clams were invented by a Rhode Island man who didn't want the darned things stretching themselves into other States.—*Fall River Advocate.*

A POROUS-PLASTER has been boycotted. We defy the best organized boycott in Americe to discourage a porous-plaster after five minutes start.—*Burlington Free Press.*

"MAMMA, did you say the angels soar?" asked little Jennie Caution. "Yes, dear." "Well, what makes 'em sore—is it because they fly so much?"—*Pittsburg Chronicle Telegraph.*

AN original way of answering two questions at a time: "Here, Biddy, my darlint, what's the time o' night, and where's the pertaty pudding?" "It's eight, sir."—*Exeter Gazette.*

A BACHELOR advertised for a "helpmate; one who would prove a companion for his heart, his hand, and his lot." A fair one replying, asked very earnestly, "How big is your lot?"—*Church Press.*

DINNER TABLE.—Little Millie to her father, who has given her the smallest piece of pie on the plate: "Papa, why is my piece of pie like Europe?" Papa, thoughtfully: "I don't know; why is it?" Millie: "Because it is the smallest of the grand divisions."—*N. Y. Telegram.*

"WHY did General Washington cross the Delaware on the ice during the storm of an awful night?" asked a teacher of her young class in history. "I reckon," piped a small voice in answer, "it was because he wanted to get on the other side."—*Church Press.*

DISCOVERY IN NATURAL HISTORY.—A little girl from the city was on her first visit to the country. While riding near Clifton Springs she saw a lot of cat tails near the road. "Oh, auntie," she exclaimed, "I never knew before that sausages grew on sticks!"—*Harper's Bazar.*

THERE'S a new baby on Deer-Hill Avenue. It arrived the other day. It is a small one. Its little five-year-old sister watched it carefully for a few minutes yesterday, and then turned to the maternal head of the family and said: "Mamma, couldn't papa have paid another dollar and got a larger one?"—*Danbury Democrat.*

"ARE we all here?" inquired Mr. Brutal Jones of his landlady the other morning at the breakfast table. "I think so; one—two—three—four—yes, you are all here, I believe," and she smiled sweetly; "why?" "Nothing much, only I see by the morning paper that a human skeleton was picked up just outside the city limits." The smile vanished.—*Merchant Traveler.*

A THIN old man, with a rag-bag in his hand, was picking up a large number of pieces of whalebone which lay on the street. The deposit was of such a singular nature that we asked the quaint-looking gatherer how he supposed they came there. "Don't know," he replied, in a squeaking voice; "I 'spect some unfortunate female was wrecked hereabout."—*Exeter Gazette.*

ST. GEORGE'S HALL for BOYS and YOUNG MEN, ST. GEORGE'S, MD. Unsurpassed; $230 to $300. PROF. J. KINEAR, A.M., Prin.

UNION COLLEGE OF LAW
The Fall Term will begin Sept. 22d. For circular address H. BOOTH, CHICAGO, ILL.

NOTRE DAME OF MARYLAND,
Collegiate Institute for Young Ladies and Preparatory School for Little Girls, EMBLA P. O., Three Miles from Baltimore, Md. Conducted by the Sisters of Notre Dame. Send for Catalogue.

RUTGERS COLLEGE,
NEW BRUNSWICK, N. J., 1 hour from N.Y. on Pa. R.R.
Year begins (examinations for admission) Sept. 22, 1886.
SLOAN PRIZES FOR BEST (CLASSICAL) ENTRANCE EXAMINATIONS: 1st, $400 ($100 CASH); 2d, $350 ($50 CASH).
Sixteen Professors; no Tutors. Classical course full and thorough. Additions to Scientific Apparatus. Ample provision for elective work in History, Physics and Chemistry during Junior and Senior Years.
French and German Text-Books used in History and Natural Science.
SCIENTIFIC DEPARTMENT.
The New Jersey State College to Promote Agriculture and the Mechanic Arts.
40 Scholarships Free
Given by the State to deserving young men. Apply to the County Superintendent of Education, or to the President of the College.
A practical Scientific School of high grade. Two courses of four years each. "Engineering and Mechanics" and "Agriculture and Chemistry."
Thorough work with constant field-practice in Engineering and Surveying. Careful laboratory work in Chemistry, with full apparatus for each student. A well-equipped Astronomical Observatory for students' use. Full course in Draughting.
FRENCH AND GERMAN TAUGHT WITH A VIEW TO THEIR PRACTICAL USE.
Special students in Chemistry and its applications, if properly qualified, are received in the laboratory.
In every part of the State, graduates are filling useful and profitable positions. For catalogues, or any information, address LIBRARIAN, RUTGERS COLLEGE.
MERRILL EDWARDS GATES, Ph.D., LL.D., President.

SHORTHAND Writing thoroughly taught by mail or personally. Situations procured all pupils when competent. Send for circular. W. G. CHAFFEE, Oswego, N. Y.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1907. NEW YORK, AUGUST 14, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

THE HORN QUESTION.

THE story told by the pictures shown at Figs. 318 and 319 needs but little explanation. It can be understood at a glance. It may be claimed that both pictures are exaggerated, and yet we believe that there is much food for thought in this drama so graphically placed before us by our artist. Whenever we stop to consider the matter, the utter uselessness of horns upon domestic cattle becomes more and more apparent. Why should cattle carry these deadly weapons about with them? No man has yet been able to give any satisfactory answer, and it is probable that there is hardly a prominent cattleman or breeder in the country who would not gladly let the horns go, if by their loss his cattle would not, for a time, lose value from being different from other specimens of the breed. We fully believe that the public could in time be brought to look upon polled cattle of every breed with satisfaction. One mistake is made by the advocates of polled cattle in ascribing too much gentleness to their favorites. The picture of the little girl leading the great bull by the ear is purely an ideal one. Polled cattle are, as a rule, more gentle than than their horned companions, but they are by no means lambs. They can strike a terrible blow with the head, and in many instances have beaten horned animals. Still they are quicker and more easily handled, and far less dangerous, as a rule.

COW FAIRNESS AND COW SENSE.

COL. F. D. CURTIS.

THERE is a great reaching out for a family cow, or as some writers put it, "a general-purpose cow." "A jack-of-all-trades" never succeeded yet in the human family, and I doubt if such a nondescript in the cow kind would be the thing. The idea, to my mind, seems ridiculous. We don't want any such cow with divided interests; but, on the contrary, what we want is a cow all the intensity of whose blood is applied to one thing or another. We have it, if folks would only be satisfied; and we have it in a thoroughbred form, and this ought to satisfy every practical mind, but the unpractical want two sets of machinery and two results from the same in one body—butter and beef. The admirers of some breeds of cattle are too greedy. They want everything. I am satisfied to call the Jersey simply a *butter* cow, and rest there. Let other breeds produce the beef, and others again give us the cheese. I am willing to be liberal and to accord to some breeds, such as the Devon and Red Polls, the ability to give a fair mess of milk and to make good beef, in which respect, however, I believe the Red Polls excel. The Devons are superior for oxen, and this is a very excellent quality.

The most touchy and determined cattlemen, who are bound to put all of the virtues of the cow kind into their cattle, are the Short-horn breeders. They won't be satisfied with the title of "nphead" on beef, but want to squeeze out the distinct butter and family breeds and occupy their ground. I begin to suspect that the Stort-horn breeders are seeing a handwriting on the wall, like that of old, and they are troubled in spirit. The ghost of the popular Herefords, the coming Angus, Galloway and Norfolks worry them, and they want to enlarge the scope of the Short-horns and put them in the milking-yard as well as the shambles.

There are such things as principles of breeding, and I supposed the Short-horns were an illustration of breeding for a purpose, and that for beef; but it seems when we would breed for milk and butter—for a family cow—we must breed for beef—for carcass. I always found that when I made a good veal of a calf or a good beef of a heifer, it made a beefy cow. And I supposed that breeding on this line for generations would fix beef types and characteristics for taking on flesh, not filling milk pails and butter tubs. There used to be old-fashioned "Durhams," which were good milch cows, but this was before the beef idea had taken hold of breeders with such intensity that they began to breed the milk-producing capacity out of the cows, and the result is that the modern "Durham"—the Short-horn of to-day as a general rule does not give milk enough to raise her own calf well. There is no disgrace in this. And why not own it, and concede the butter kingdom to others. It is really the result of science, and something to be proud of, as the counterbalance is to be found in thickened loins, broader hips, and fuller muscles, with a nature for growth, and to fill out just in the right places.

A Jersey or any genuine milking breed doesn't do this. When fed for fattening, they fill up inside, and never fill out and expand as do the beef breeds. To do so is not in their nature. They are not adapted to it, and have not been bred for this sort of development and growth. A modern Short-horn in milk has the capacity to increase her milk flow but little more, however well fed, and her food goes where her nature and breeding design it should—to fat and flesh. The Jerseys make nice beef, and fatten in their way with little food; but attempts to convert them into beef cattle would be just as absurd as to make out the Short-horns to be good family cows.

HORNS. Fig. 318.

NO HORNS. Fig. 319.

The Vineyard.

CALIFORNIA NOTES FROM PROF. W. A. HENRY.

California rains; El Cajon Valley; superiority of grapes grown without irrigation; growing raisin grapes; winter preparations for summer drought; picking raisin grapes; making raisins; rapid increase of vineyard; planting the vines; profits from raisins; grape yield per acre.

I SEND the RURAL by to-day's mail a small package of raisins, which I hope will reach you safely. They were grown in the vineyard of Mr. Geo. A. Cowles, of El Cajon, this county, and are a sample of several thousand boxes made by him last season. [They are of fine quality, meaty, sweet, tender. The stems are notably small.—EDS] Through the kindness of Mr. J. M. Merrill, Secretary of the El Cajon Valley Land Company, I was shown the wonders of this mountain-locked valley, and will try to give your readers some idea of what it is and is to be.

El Cajon means a box, I believe, and was applied to the valley because it is shut in by high, rocky walls. Originally a stock ranch, it was changed to a grain farm, and soon is to be a great raisin factory owing to its peculiar adaptability for making that article. In the valley are some 40,000 acres of land, fully one-half of which grows the grape without irrigation, and so makes the cost of production very small. Besides this, a grape grown without artificial water is higher-flavored and less watery than one grown by irrigation, as might naturally be supposed. In El Cajon water can be had by wells dug from six to twenty feet deep, showing that water is near the surface of the ground.

I visited the raisin vineyard of Mr. Cowles, and was greatly interested in his methods of growing the grape and making raisins. He has 150 acres of grapes in bearing, and every vine was an example of thrift and productiveness. The vines are set 12 feet apart and the stem, or trunk, is cut off close to the ground, and all arms are kept very short, so that the new wood sprawls over the ground like a melon vine. Mr. Cowles gives his reasons for this by saying that the heavy clusters of the Muscat of Alexandria, which he grows for

raisins, would be injured if they grew up in the air, by the swaying of the vine in the wind, and when nearly ripe, the vines would bend so as to let in the sun, which might scald the fruit; so the rich clusters lie on the ground just as a melon or squash would. Not a weed can be seen in the vineyard, and the reddish soil is very mellow and in fine tilth. The vines are planted by setting cuttings 12 feet apart. In three years these bear fruit and by six or eight years are in full bearing. As before noted, the vines when trimmed are but short stumps, about four inches high, and have a few buds left for producing fruit wood. In consequence of such trimming, cultivation is very easy in the Winter when the rains come and the ground is thoroughly prepared for the long drought of Summer.

Though no rain had fallen for some ten weeks before my visit, the vines were wonderously green and growing rapidly. No rain is expected until after the raisins are cured. This explains why weeds do not trouble at this season. There is no moisture in the top soil for the weeds to start. This dry top soil acts as a mulch and prevents evaporation: at six inhces I found it as damp as one could ask.

At picking time the great clusters of Muscats are laid on hurdles made of boards, two by three feet "square," resting on the ground between the rows of vines. These hurdles are inclined slightly to the south so as to get the full force of the sun. In this valley the air is dry and the temperature high at the curing season. Mr. Cowles claims for it better conditions than those of any locality in the State for making a fine sun-dried raisin. After lying a week or ten days, the grapes are turned by placing an empty hurdle on top of that holding the grapes, and quickly inverting them. At the end of three weeks the grapes are cured, and are gathered into boxes holding a couple of hundred pounds each. In these sweat boxes the brittle stems gather enough moisture from the fruit to become flexible and pliant so as to handle without breaking.

The raisins are sorted and pressed into five-pound layers, which are put four in a box ready for market. These grapes grown without irrigation are so firm in flesh that only four two and a half to three pounds are required for one of our raisins.

El Cajon seems to me a paradise for raisin making, for there is a wonderful combination of soil and climate for that purpose. Some 600 acres of vines were planted last Winter, and from two to three thousand more will be set the coming season. Planting is a simple process here. After the ground has been thoroughly prepared, it is marked in checks 12 feet square. A hole is made with a crow-bar, and a cutting, about 15 inches long, is inserted. Great care is necessary to get the soil firmly pressed about the cutting. The vines are tended much as corn is in the West, and when they are properly started, no difficulties seem in the way.

There are already some beautiful homes in this valley, and it will have many more ere long. I predict it will be given up to raisin making entirely. Mr. Cowles came to it in search of health, which he regained, and is working faithfully to advance the good name of the valley and fill it with settlers. Lands cost from $75 to $100 per acre. Mr. Cowles sets the net profits from raisins at from $50 to $150 per acre per annum. With such results the lands are not dear yet, though rising in value. So far, the raisins put in the market have sold readily at high prices. As to the yield, Mr. Cowles is ready to prove that he has grown from a single acre 15 tons of grapes. The usual yield is from three to six tons.

St. Diego Co., Cal. W. A. HENRY.

Farm Topics.

THE DARK SIDE OF FARMING.—V.

HENRY STEWART.

ONE of the greatest drawbacks to prosperity and pleasure in the business of farming is the want of stability and persistence in any chosen pursuit. Some men cannot even make up their minds as to how they should go about any necessary business, and consequently perform it in a most inefficient manner. They change their minds with every fancied reverse of fortune, and break up plans that have become settled by lapse of time, so that the breaking up is productive of loss and perhaps disaster. "Unstable as water thou shall not excel" might be said of many farmers who blame their chosen pursuit for their partial failures, instead of blaming their own mistakes. There is the man who begins business as a dairyman, let us say; he goes into it with a rush; perhaps he succeeds moderately well, but he finds it hard work, needing the closest application. While it is novel he is interested, but as the novelty wears off and he finds he is only making a bare living and is not laying up money, or able to indulge in luxuries, he becomes dispirited and wants a change. He declares that the dairy is an unprofitable business; that bogus butter ruins it, and that something else pays a great deal better. There comes a boom in hops; the price goes up to a dollar a pound, and he gets rid of his cows at any sacrifice and buys hop roots and poles, and reads up hop-growing. By the time he has any hops to sell, spared through painful effort from the lice and mildew and the various other troubles incident to their culture, the price is down to eight or 10 cents, and again he is discouraged and on the ragged edge which separates hope from despair. His hop yard is plowed up and he tries something else which is better, but always with the same result. He tires of it, or perhaps utterly fails, which is probably because of the unfortunate want of persistence, and losing at every change and turn, he is soon in distress and goes over to the dark side.

Perhaps there is no other cause of failure that is so prolific and common as this. If we examine into any special business in the grand industry of farming, we find the men enter-

it mostly of this class, and who have given up pursuits in which thousands of farmers live happily in sunny homes. We find the Florida orange groves *in futuro* chiefly hoped for but not seen—as yet) occupied by many such men. Fancy cattle men make money out of them. They are the chief purchasers of novelties in seeds, plants, implements, and all are restless, looking and hoping for some readier way of making money than persistent, effective work. The crowds of frauds, like parasites which live upon diseased matter, prey upon such misguided men and make victims of them, and every disappointment adds to their misery. Those persons who are in a position to know, the editors who receive so many urgent letters of inquiry about this new place, or that new pursuit, and which is best to be done under such circumstances as no stranger could possibly form an opinion of, know how many such unhappy, unstable, undetermined men there are existing, but not living, upon farms. A time comes to many of them at last when, like old Eneas, "tossed and driven by adverse fates," they are cast upon some shore, wrecked amid storms and clouds. Then a ray of light breaks through upon them; for they are where they cannot get away and must stick at least, and like men, go to work at whatever they are driven to, and persisting by force of adversity they finally find that they have been wasting a life in seeking. But it is thrust upon them in spite of themselves.

Many a man who has thus suffered, or who is now suffering, may look back to his childhood and see how his early training led to this instability and consequent failure. In his boyish pursuits many things were begun but none finished, and as he grew in years the habit grew, and became confirmed. This is a matter for parents to consider. They have the forming of the character of their children, and if any child has fallen into this habit they should correct it at once. To finish what has been begun, to adhere to a choice which has been made after mature and careful consideration, to persist and persevere, and never lose sight of the end in view or turn aside from its straight pursuit, are indispensable to success. Think of the men who have made a mark in the history of the time; of the leading farmers, stock breeders, horticulturists, dairymen, all of whom are sought as advisers, leaders, teachers, examples, and what is their history? An unbroken course in pursuit of aims which they have reached, and of ends which have brought prosperity and success and honor to them.

The business of farming has two sides; one lies full in the glow of the warm bright sunlight; the other is on the shady side, buried in gloom and darkness. Every man can choose which side he will live upon. The path to each diverges from a plain road plainly, so that it cannot be mistaken. The business of farming is one in which no man can fail who uses common prudence, who is industrious, persevering, careful, foresighted, economical. It has the world's wants to supply. The farmer feeds and clothes the world, and every product of the soil has its wating consumers.

CORRESPONDENTS' VIEWS.

I DON'T like the way pitchfork handles are made. The handles are too large round towards the fork. I had one such and the men all shunned it. I used it and my hand was cramped grasping so large a hold. I could get no others at the store, so I bought two of the usual size and shape. I took them into my shop and with plane and spoke-shave altered one-third of the lower part to an oval, the widest way up and down. These forks are now the favorites in the field, as the hand easily grasps the handle and it will not turn. Try one and you will like it. Some manufacturer might use this idea to his advantage.

Creedmore, L. I. H.

PEOPLE complain about our poor country roads. My opinion is that the principal cause for this is the laziness of the men when working out their taxes. They lean on a hoe handle and talk, as though they had plenty of time. They ought to work for the public as they work for themselves. F. R. L.

Prospect, Me.

I HAD a few vines of Agawam, Brighton, Catawba and Concord Grapes in bearing last year and this. Agawam has been suitable for table use four weeks now. Bags on the bunches prolonged their use about 10 days. All fine, large and well flavored. Having only a few vines of each, I disposed of the grapes here at 10 to 15 cents per pound. Another year I ought to have quite a crop. Do you think they would bear shipment from here to Northern cities during the time they ripen here, while the weather is so hot? [If packed in refrigerator cars they would doubtless go through all right.—EDS.] J. M. M.

Green Cove Spring, Fla.

MANY good farmers think they must leave their comfortable homes and move into the town or city, so that the children can have the advantage of city schools and city ways. At first they do not mean to leave the farm permanently, but almost before they know it, the city becomes the home. The farm is rented and runs down. When at last the children grow up to be a little ashamed of father and mother, and the old folks go back, they have to spend their old age in bringing up the neglected farm. This plan is all wrong. Why not improve the country schools so that there will be no need of running to the city for an education? The farmer's place of business is on the farm. E. D.

Fairfax Co., Va.

I KNOW men about me who think they must have their own reapers when they have not work enough to keep such machinery busy, and have to run in debt for it. It would pay them better to have their grain cut by a neighbor, but they have a pride in doing it themselves. They get into debt for the implement, and the note is sure to fall due just at the wrong time. They have no place to house such a machine, and the consequence is that it is about destroyed by the weather. They had better wait till they can buy the implement right out. M. J.

Lawrence Co., Kan.

ON page 465 the N. Y. Times is quoted as advising farmers to let law-making alone. We have heard this old story about farmers being the "salt of the earth" about long enough. It is getting stale. We have had our backs patted until they are sore. Such palaver does not make us forget that farmers have to carry the heaviest part of the burden of supporting these "law-makers" and paying their junketing bills. We also have to bear the heaviest part of unwise legislation. We can't hide our property from the tax collector as the holders of stocks and bonds can. The question of law-making is not merely a question of morals and principles, but a question of finance as well. The farmer should devote as much attention to such questions as he does to any proposed expenditure of his capital. We shall always have those among us who will swallow anything in the line of political bait. We want to increase the number of those who will not forget the action of many legislators on railroad matters, oleomargarine, and the various questions directly affecting farmers. Extortionate charges for transportation and monopoly oppression, are legalized and made possible by these legal legislators. It is the direct business of the lawyer to make money, and he cannot help being the sworn friend of monopoly. I say do not follow the advice of the Times. If we did there would be no use in our going to the polls at all, unless to vote upon some question that affects farming directly. Let us rather take more interest in politics and protect our own rights.

Norfolk Co., Va. E. E. B.

MANY farmers who complain of lame horses have themselves to blame. They start into town and forget to oil the wheels. Before they start home they oil themselves up with a little cider or something stronger, and home they come too fast for the horse. In the morning the horse shows a little stiffness in front. They hitch up the old mare in his place, and throw a foot of straw under him to induce him to lie down. Such treatment is all wrong. Better take him out and exercise him a little. His stiffness is likely to become permanent if he is left too long. I like a medium-sized horse. I don't want one so small that he has to strain every muscle to keep his end up, nor one so large that he never has to make an effort. W. R. T.

Franklin Co., Kans.

HOG cholera visits this section quite frequently, yet I have never had a case among my hogs. In the majority of cases that have come under my observation, the hogs were in small pens, which, as a general thing, were not kept clean, or in places through which ran weak, dried up streams of water. Stagnant water is always unfit for hogs. Many persons bed their hogs in stable manure or under the straw stack. This does not pay me. If they are too hot in their beds and come right out into the frosty air, they are sure to suffer. A hog is a good deal like a man in his make-up.

Montgomery Co., Va. J. M. E.

COAL ASHES AS A FERTILIZER.

COAL ASHES possess little real value as a fertilizer, but the mechanical effect which they have on some soils is truly surprising. For loosening up stiff clays, that have stubbornly refused to yield to all attempts to break them up, there is nothing that can be compared to coal ashes. I have seen clay soils which would resist everything else, become friable and as loose as an ash heap after receiving a liberal application of coal ashes.

When seeding such land down to meadow or pasture, a heavy application of coal ashes will be found invaluable. It renders the soil porous, so that the roots of the grasses readily permeate it in search of food, while it assists very materially in carrying off the superfluous water in the Spring of the year, which, if left to escape by the slow process of evaporation, will carry with it many valuable elements of fertility. If the readers of the RURAL who have stiff clay soils, and who have been trying in vain to break them up, will give coal ashes a trial, they will be agreeably surprised at the result. They are easily handled, and if they can be had without hauling too far, it does not cost much to apply them. Of course, the application must be heavier than that of lime or anything similar, three or four hundred bushels per acre being the proper amount. One such application will be sufficient. Experience has shown that where such application was made 10 years ago, the soil is as loose and as easily worked as when the ashes were first thoroughly incorporated in it. I have often thought, after observing the effect of coal ashes on clay soil which had been seeded down to grass, that the ashes contained some valuable fertilizing elements, notwithstanding the fact that a chemical analysis fails to show anything of value in them in that line. The effect which they have on the soil is much the same as that of lime. Those of the RURAL readers who can procure the ashes without too much difficulty should try them as an experiment J. C. P.

Blair Co., Pa.

Field Crops.

SPORTS OF THE DIEHL-MEDITERRANEAN WHEAT.

I SEND the RURAL some samples of the product of the Diehl-Mediterranean Wheat, received from it two years since. The ripe wheat came from one grain of the first year's planting, and from the only heads that were not bearded that year. The crop of it was ready to cut for four or five days before it was harvested, and but for the exceedingly cold Winter and Spring, would have been ripe May 1. The samples of the unripe heads show that this year there is not only a great variety of bearded heads, but that there are also many kinds that are not bearded. In looking over the patch, which was planted in 12-inch rows, 12 inches in the row, anybody would be forced to the conclusion that the cross is not permanent, and that if the change continues as rapidly as it has this year, it will only take a few seasons to render the bulk beardless, and on the remainder the beards will be diminished to a great extent. With the heads, I send you a few of the plants with roots attached, from which it appears to me that in some cases the same plant bore bearded and beardless heads. To one acquainted with wheat-growing and its characteristics, I think my patch would have been an interesting study, on account of the wide variations in the heads produced from one variety of seed. I have never grown any wheat except from the D.-M. sent me by the RURAL. The heads sent, which are no better than those in the rest of the patch, were raised on light, sandy soil, without fertilizers except what was put on it in September, 1884.

Americus, Ga. "GREYBEARD."

R. N.-Y.—We were enabled to separate the seemingly one plant bearing both bearded and beardless heads into two—the one bearded, the other beardless. We have raised five acres

of the Diehl-Mediterranean Wheat. The seed was somewhat mixed, as we believe. We fear this was the case with yours. Still, it may have sported in both cases.

HOEING SWEET POTATOES.

At this time of year, sweet potatoes should be taken great care of. They should be well weeded out, and the ground should be made very loose, without disturbing or interfering with the plants. For hoeing, use the back of the hoe, which should always be used simply to loosen the earth around each hill or plant to the depth of one inch—no deeper. Hold the vines in one hand, and hoe with the other. A great many use the sharp, or front side of the hoe. This is certainly a great mistake. I have raised sweet potatoes for the last 10 years, and find this will not do. While I who work with the back of the hoe have fine potatoes, my neighbors who use the edge have small and poor ones. This is easily explained. After the vines have become four to five feet long, they put forth small fibrous roots which, in a short time, form potatoes, and, of course, if these are cut or bruised, it would stop the growth or injure the plants, and at the same time ruin the prospect for large potatoes, and produce only a small quantity in each hill. I have tried both ways and have satisfied myself on this point. More sweet potatoes would be raised with the same quantity of manure if the back of the hoe were used.

Hightstown, N. J. J. S. B.

Farm Economy.

FODDER CLAMP.

Every farmer has realized the inconvenience of handling loose fodder. To obviate this trouble the clamp shown at Fig. 322, has

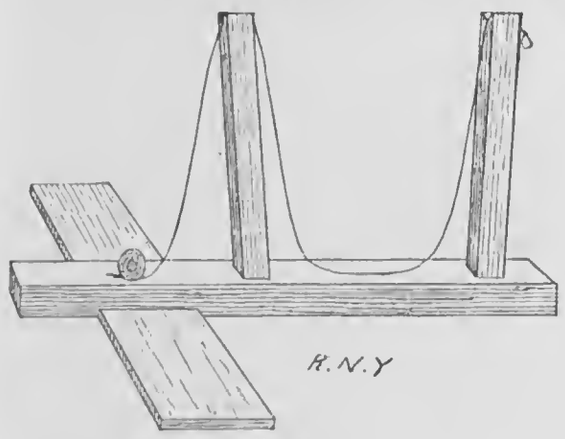

Fig. 322.

been used by me for a short time. By its use much is gained in time, when handling, and there need be very little waste, as all loose blades can be gathered and placed in the clamp, and bound with the longer fodder. The clamp is made from a piece of scantling 2x3 inches by three feet long, having two uprights and a board nailed crosswise to the bottom, to prevent the clamp from falling over. The uprights are 18 inches high and placed in mortices 14 inches apart, and nearer one end than the other. The uprights should stand two inches farther apart at the top than at the bottom. A saw kerf is made half an inch deep in the top of each to receive the twine. (I use reaper twine). The clamp is light and valuable in field or barn. To use it, make a loop at the end of the twine, and place it in the kerf at the top of one upright; leave the slack as shown, and pass the twine on through the other kerf. Husk an armful of fodder and lay it in the clamp, and so on until it is full. Place one knee on the bundle, and bring the twine together, and tie by passing through the loop and making a simple knot. Cut the twine; place one foot on the board and lift the bundle out, and replace the twine as before. The bundles can be easily bound as tight as the twine will bear. A clamp of this size will make about four bundles from a shock of 100 hills, and once used will always be wanted.

Oregonia, Ohio. W. C. S.

CARE OF TOOLS.

It is good advice to tell us to keep the tools sharp, but we must keep them clean as well. I am a great hand for keeping my tools bright. I hate the sight of rust, and, as a consequence, my workmen say that work at my place is very easy. I keep an iron kettle within a few feet of my tool house, and every workman is expected to wash his tools after using them. They are then dipped into a box of powdered slaked lime, and then hung up. Large tools, like plows, are washed and then have lime dusted over them. They keep bright and clean till wanted. I have had a shovel in use since 1831. It is now as bright as when it came from the maker. Farmers might save hundreds of dollars by taking care of their tools properly. One Spring I saw two strong men, with pick and crowbar, digging a plow out of ground where it had been frozen in during the Winter. In this township there are thousands of dollars' worth of machinery just eaten worthless by rust. It all might have been saved by proper care. There should be a good tool house on every farm. A. L. O.

Brockport, Ill.

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

A GOOD WORD FOR THE KIEFFER PEAR, AND A GOOD METHOD OF GRAFTING.

Near the Rural's Farm on Long Island is that of our good friend, Augustus T. Hewlett. He is one of those farmers who have never had occasion to complain that farming doesn't pay, and any one who knows something of his methods; of his intense interest in all that may have to do with an improved agriculture; of his trials of new grains, potatoes, roots, poultry and fruit, albeit they are made in a small way, is not long at guessing the reason why.

Seventy-five yards from his house stands a pear tree 100 years old. Three years ago, last April, this was grafted to the Kieffer. A 25-foot ladder was needed to reach and saw off the higher branches, many of which were six inches in diameter. The cut was made parallel with the land, or at right angles to the stock. Slits from four to a dozen (according to the size of the stems) were then made through the bark from the top downward (as in budding), and the cions, beveled only on one side, inserted, as shown at Fig. 324, and as often before described in the R. N.-Y. The cions are not bound with bast or anything whatever. They are merely covered with grafting-wax, and 90 per cent. so treated unite and grow. The Kieffer cions are now from five to six feet high. They bore the second year two peach baskets heaping full, though many pears were blown off. They were picked October 1st, and, placed in a cool, dark cellar, ripened in from two to three weeks as yellow as gold, with the bright red cheek characteristic of this variety at its best. They were juicy, and pronounced very good by all who ate them. This year the tree is laden, and Mr. Hewlett promises to send some of the fruit to the Rural.

Mr. Hewlett grafts old cherry trees in essentially the same way, with entire success. On account of the exfoliation of the bark of the cherry, however, it is necessary to cover the wax with something. He prefers tarred paper which is bound around the grafts and raised above the top of the stock, forming a rim an inch high. This is held in place by a

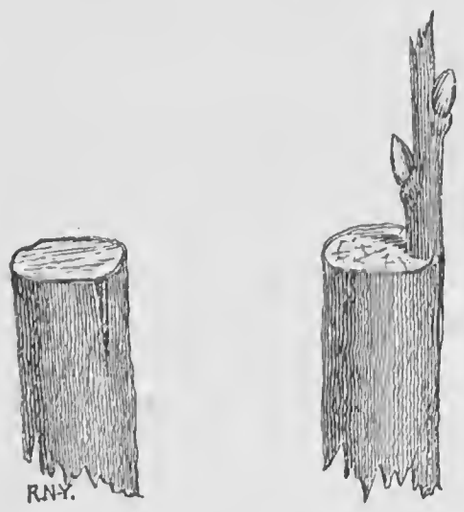

Fig. 324.

cord tied tightly about it, while the space between the top of the stock and the paper is puddled with mud even with the rim, forming a round layer of soil an inch deep The cord and paper in a year or so decay and fall off, leaving the clean stem with its thrifty cions.

THE RURAL'S SEEDLINGS.

Here in one box we have seeds of Rosa rugosa crossed with Jack and Harrison's Yellow. The Ramanas Rose has but one row of petals and forms lots of fruit when self-fertilized, and "takes" with foreign pollen readily. Something desirable ought to come out of crosses with this rose. Its foliage is peculiar, is rarely attacked by insects, and the plant is hardy and long-lived.

In another box we have seeds of the raspberry crossed with the blackberry; in another seeds of the blackberry crossed with the raspberry. In still another, seeds of a thornless blackberry are planted, and, finally, those of a large foreign gooseberry.

These boxes are six inches deep and of various sizes. They are filled with garden loam, placed in water until the whole mass is wet and then glasses are placed over them to retain the moisture. It is proposed to winter them in pits.

Horticultural.

A NEW STRAWBERRY OF PROMISE.

E. WILLIAMS.

The best-looking and most attractive seedling I have seen this season, was shown by Mr. Walton, of Moorestown, N. J. Owing to its bright scarlet color, conical form, slight neck, reflexed calyx and very uniform size, it comes nearer to my ideal of perfection than any berry I know of. Every berry seemed almost an exact copy of every other. I subsequently had an opportunity to sample and examine it freely at the table of the originator, and in his field, and it seemed to be deficient only in two features to constitute a perfect strawberry. The quality is fair to good, but not the highest, and the flower is pistillate. Growing in field culture, under very ordinary care, with Monarch (of the West) on one side, and, I think, Atlantic on the other as fertilizers, it proved a vigorous, strong grower, abundantly productive. Berries large and very uniform. I tried in vain to find one of abnormal growth. I gathered numerous samples with a view to illustrate it, but Mr. W. objected, fearing they would not fairly represent future possibilities under extra high culture, and thus do it an injustice. In deference to his wishes, I abandoned my intention, but not the idea that a fair average representation of what a berry will do under ordinary treatment, as compared with possible results under high culture, is much the fairest and most honest, no matter what the custom is. I do not know that Mr. W. has determined to send it out, or whether

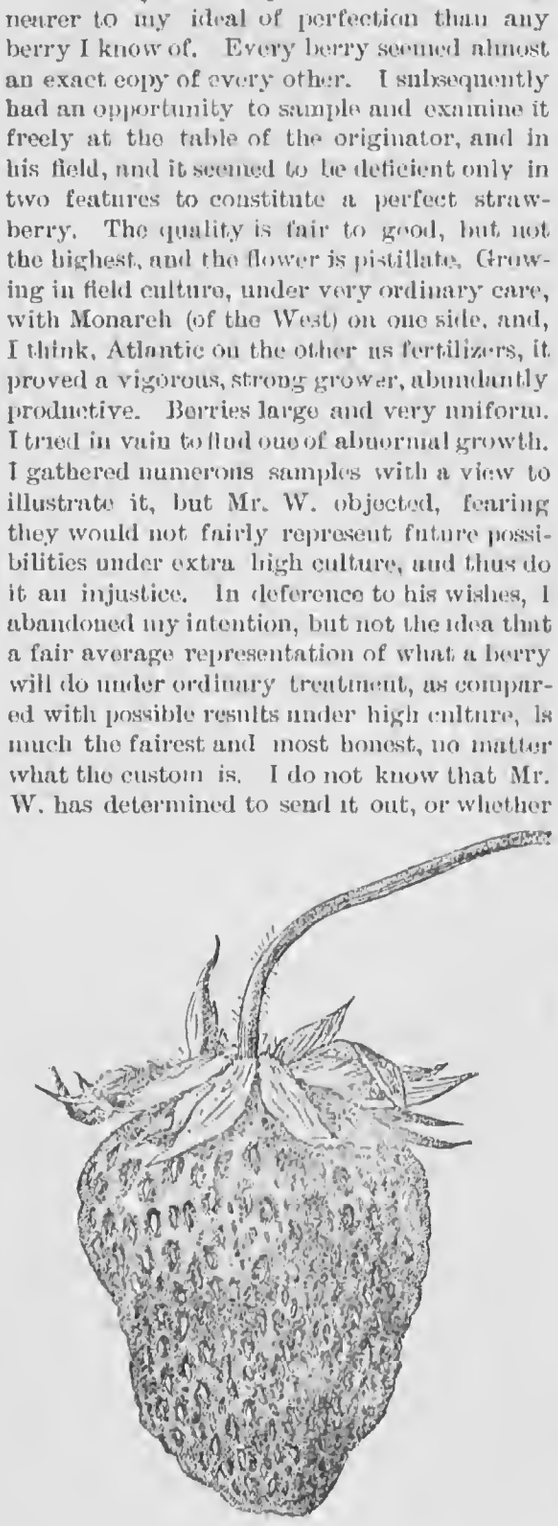

Fig. 320.

he has even named it yet; but he will himself try it on a much larger scale and more thoroughly as a market fruit, first. In this he is right. Meanwhile, if, in view of the prevailing condition of our market, any berry-grower is verdant enough to see a prospective fortune, large or small, in strawberry growing, this berry of Mr. W.'s may be worth looking after; but, as a large grower remarked to me, the present low prices do not justify much attention or expenditure for new varieties; the old ones are just as good to lose money on. My position is, that the certain and sure profits in small fruits are found in an abundant and free home consumption.

Montclair, N. J.

[A box of the berry above referred to by Mr. Williams, was sent to this office June 10. Fig. 320 is true to nature, and Fig. 321 shows

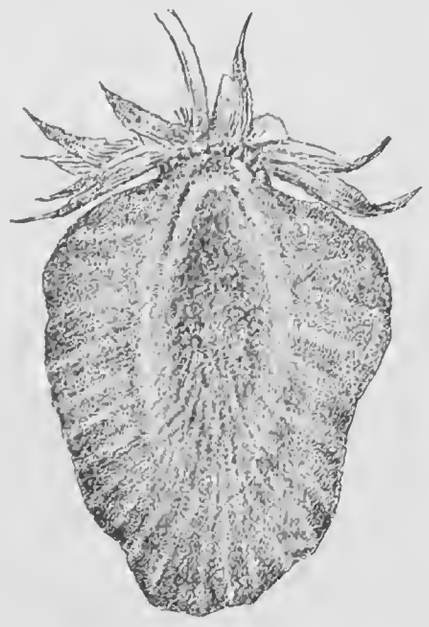

Fig. 321.

a half section. The following notes were made at the time: "Color, bright scarlet; shape, ovate-conical, rounding at the top; flesh solid and colored; seeds a little darker than the flesh, and imbedded somewhat deeply; calyx ample and slightly reflexed; quality fair—as good as the Jewell. The remarkable things about this berry seem to be, first, the size, which averages very large; second, uniformity of shape."—Eds.]

THE LUCRETIA DEWBERRY.

In your "Plain Talk on Blackberries," in the Rural of July 31st, the Editor says, "The Lucretia Dewberry, after what we consider to be a fair trial, is not judged to be worthy of introduction." Can it be possible that you have the true Lucretia? I am almost sure you cannot have it, but some of the spurious plants that have for years been mixed up with the genuine Lucretia. This, as I have seen it growing in several States, is to my mind the most valuable of all the blackberry family yet introduced. With us the plant is as hardy as the Kittatinny, very productive of berries as large as Lawtons (some berries picked here last week were 1¾ inch long, by one inch cross-diameter), ripening as early as the Gregg Raspberry, and far better in quality than any other blackberry I know of. I must confess to being charmed with it as a family berry; and being so large and productive and so extremely early, it must prove valuable for near markets. It is not firm enough to stand long shipment. Having often visited the Rural Grounds, and knowing how fair and impartial your tests are, I cannot think you have ever seen the real Lucretia, and shall take the liberty of sending you some of the plants at the proper time for planting, in October.

So. Glastonbury, Conn. J. H. HALE.

Remarks.—We are always very glad to be corrected, and thank Mr. Hale for the above important note. We fancy that we have the true Lucretia. The berries are large, ripen early, etc., as Mr. Hale states. The vines are great bearers. But the *space* they cover should be considered. Suppose that one Lucretia plant covers twice the space of a standard, and yields twice as much fruit; do we gain anything? It is certainly harder work to gather the berries of the Lucretia than those of standards. Its earliness and hardiness, however, are certainly points in its favor, which should be duly considered.—Eds.

THE INTRODUCTION OF THE SHARPLESS STRAWBERRY, ETC.

In the Rural of July 31 I notice that President Wilder gives Ellwanger & Barry credit for introducing the Sharpless. That is a mistake. I offered them the control of it, but as they did not accept my offer, I disseminated it myself, and sold to other nurserymen, who put it on the market at the same time. I mention this in justice to other parties.

The Alaska Pea with me seems to be identical with Early Kent. The Triumph Gooseberry does not mildew in our place, where it is said that it originated.

Catawissa, Pa. J. K. SHARPLESS.

"THE MUCH TALKED OF DEACON."

If Mr. Falconer's Deacon Lettuce is the same as the White Summer Cabbage, it is quite different from the one that I have grown. The most careless observer would hardly call them the same. Although the White Summer is an excellent heading lettuce, with me Deacon has surpassed it in the size and neatness of the head. The Deacon that I have grown, the seed of which I secured directly from the introducer, more resembles the old Imperial than any other that I have seen. Indeed, I think it has probably been developed from that variety by selection. Until this season, I have not seen a synonym, of the Deacon, but a lettuce called West Indian, received last Spring from a European seedsman, appears to be the same.

Geneva, N. Y. E. S. GOFF.

Floricultural.

FLOWERS AND SMALL FRUITS.

Almost every one that has any room, grows something to give flowers, and my customers, at least, like to read and talk about them; but they complain that they can not understand half the books and papers they buy. I don't wonder, for I get puzzled myself sometimes. So many things are recommended for amateurs to get, that require the care of an experienced gardener, that failure must be the sure result, and I am only surprised that more do not get disgusted. We have so many beautiful things that grow easily, that there seems no need of coaxing people to buy plants that one knows cannot succeed. I know of a case where a dozen fancy caladiums were bought, by advice of the gardener, for a rockery, and when I expressed my surprise, he laughed and said he did not expect they would grow; but the lady might as well spend her cash in that way as in any, if she liked them. I like to try novelties, and do every year, still I do not

think I am justified in pushing them on customers, until I find out something about them.

The RURAL small fruit notes have been a great help to a great many, and I know of one lady who reads the paper, who took a small strawberry bed into her own hand, did the entire work, and this year picked over 100 boxes of as fine Sharpless and Wilsons as I ever saw shown at any fair. Many of the Sharpless would measure four to five inches, and for a wonder were of good shape and color. They were kept from runners, and mulched with hay, and this last I think the cause of their extra fine shape, as it kept them off the cold soil, and so made both sides of the berry grow more uniformly, besides allowing them to ripen without a white spot or sign of decay on the under-side. It was the largest crop I ever saw for the space taken, and she was very proud of it, and reading the RURAL encouraged her to try it. Bulbs of all sorts seem to be doing extra well this year. Ever since the early tulips and jonquils showed themselves, I have had plenty of flowers from Dutch bulbs and lilies of different kinds. Just now I have quantities of L. Humboltii, and they ought to be grown more: for in masses they make a grand show. Soon the Japan Lilies will come in, and in spite of the hard Winter I never saw them better, Alba in particular. Melpomene is not as good, but that is inclined to be weak. With me it is as tender as Auratum. For the last four years there has been such a display at the public gardens of tulips, hyacinths and lilies that the people about Boston seem to have taken a new interest in them. Of all classes of flowers, I consider bulbs the easiest to grow, either for open air or to force, and they seem to be the least understood; for I have to answer more questions about them than anything else. A GARDENER.

E. Braintree, Mass.

The Poultry Yard.

MANAGEMENT OF YOUNG TURKEYS.

OF all classes of poultry young turkeys are the most difficult to raise; yet when fully matured, turkeys can endure greater extremes of cold and heat, and subsist with less assistance than any other class of poultry. Although it is often overlooked, yet much depends upon the parent stock. Young turkeys hatched from eggs laid by hens only one year old do not possess the vigor and hardiness of those produced from eggs laid by fully developed birds. It is better, therefore, to use gobblers and hens over two years old for breeding purposes.

If we can get at the root of the difficulty in the way of raising young turkeys, much of the loss may be avoided. To do this it must be considered that young turkeys feather very rapidly. It is this quick growth of feathers that often debilitates them, and causes them to drop off suddenly. They require a large quantity of food, which must be given often, and consist of that which contains a large proportion of those elements essential to growth. Hence corn meal is insufficient food for young turkeys, as every farmer's wife knows. Like chicks, hard-boiled eggs, finely chopped, and mixed with onion-tops, are excellent for the first two days. Wheat bread, soaked in milk, may then be given, varied with cooked oatmeal containing lettuce or onion-tops. As they require close attention, owing to the rapid development of feathers, the safest mode of feeding is to give them four meals daily. As soon as they begin to run about they should have not only a variety of cooked ground grain, with milk; but also meat three or four times a week, with all the chopped vegetables they can eat, as well as ground bone in the soft food. Turkeys thrive best on both animal and vegetable food, and cannot endure confinement. When very young, they may be given liberty; but the hen should be confined in a small yard to prevent wandering off. The little turks should not be allowed in the wet grass, and on the appearance of indications of a shower, they must be kept shut up until the danger is over.

Dampness is fatal to young turkeys, and causes greater loss than anything else. The essentials to success are, nitrogenous food, warmth, dryness and frequent feeding. If produced by the union of vigorous parents, and given careful attention until after the critical period, fewer losses will occur. When three months old, they will be able to take care of themselves without assistance. Many persons recommend keeping the young turkeys confined, but they cannot be easily raised unless given liberty, as the turkey is naturally addicted to foraging; but if there are a number of them, it will be profitable to watch them until they are well advanced. The milk and drinking water should always be so given that the birds cannot wet themselves. When the young ones are put with the general flock, and are made to forage for themselves, it will be found an advantage to give them a good meal of grain when they come up at night, especially of ground oats and midlings, moistened with milk and baked. This is not absolutely necessary, but if so treated they will grow faster and attain larger size, and be induced to come up regularly of evenings. If insect food is not abundant, a feeding of chopped meat twice a week will be very acceptable. If hatched under hens and raised with the chicks, they can be taught to roost in the poultry-house at night, but they prefer the open air, if well protected from winds and enemies. When being fattened they should not be confined longer than ten days, or they will worry and become discontented, thereby losing flesh. P. H. J.

HENS WITHOUT ROOSTERS.

SOME persons say hens will lay as well without cocks as with them. Some years ago, two neighbors, both keeping poultry, with only a picket fence between their places, were on pleasant terms till one killed off all his cocks and kept plenty of hens. These enticed the cocks from his neighbor, and with them many of his hens, who laid on the wrong side of the fence, to the great disgust of their owner.

MORAL: If you are within hearing distance of any neighbor's poultry, and wish to live in peace, keep cocks with your hens. H. H.

REMEDY FOR LICE ON HENS.—Crushed coal with carbolic acid on it will make lice scarce in hens' nests. I take a square, stout box, and crush the coal in it by pounding with a round-ended stick. For half a bushel of coal five tablespoonfuls of carbolic acid will do the work. A handful of this thrown into the bottom of the nest will make the lice run for their lives. J. S. B.

Hightstown, N. J.

Indust'l Societies.

THE ROYAL AGRICULTURAL SHOW.

(RURAL SPECIAL REPORT.)

GENERAL FEATURES.

EVER since its first show, in 1839, the Royal Agricultural Society of England has held its annual exhibitions each year in a different section so as to give an opportunity to the people of the various parts of the country to visit the show with the greatest convenience and at the least expense, and draw from it the many useful lessons taught by the great number of exhibits there brought together as object lessons. The present year the show opened at Norwich, the capital of Norfolkshire, on Monday, July 12, and closed the following Friday. In 1885 it was held up north at Preston; in 1884 it drew crowds to Shrewsbury, in the West; and in 1883 York was for once waked up to liveliness by its presence.

Norwich is a quiet town of about 87,000 population, the center of a rich agricultural country. It was hardly thought that the number of exhibits or visitors would come up to the average; but expectations were in both cases exceeded. The live stock exhibits compared as follows with those at other recent meetings:

	Norwich, 1886.	Preston, 1885.	Shrewsbury, 1884.	York, 1883.	Reading, 1882.	Derby, 1881.	Carlisle, 1880.
Horses.....	495	438	407	611	239	266	487
Cattle.....	692	539	579	462	598	392	434
Sheep.....	448	433	490	412	492	414	434
Pigs.....	205	203	211	200	188	167	146
Total....	1840	1613	1687	1685	1467	1229	1501

Last year the number of visitors at Preston was 94,192; this year there were 104,910 at Norwich. The daily attendance was: Monday, admission fee, 5*s.*, 625; Tuesday, 2*s.* 6*d.*, 8,077; Wednesday, 2*s.* 6*d.*, 11,043; Thursday, 1*s.*, 42,774; Friday, 1*s.*, 42,394. Although the show is held at the hight of midsummer, it is almost always greatly injured by wet weather; and on Monday, the opening day, and that on which live stock was judged, there was a regular downpour in the afternoon, and an extremely uncomfortable drizzle in the morning. Occasional showers also marred the pleasure and kept visitors away on Tuesday and Wednesday; but on the last two days of the exhibition the weather was all that could be desired. As the show is always held in the open air, the condition of the weather is of great importance, for the number of visitors is small during bad weather and they can derive but little benefit from the display with rain overhead, mud under foot, and discomfort all around.

The crown and half-crown days usually attract the "more select" class of visitors in sufficient numbers to compensate for the smaller attendance common when the admission fee is so high; but the wet weather kept this class, to a great extent, away this year, and, moreover, neither Norwich nor the surrounding country is blessed with a superabundance of wealthy people. On the brilliant shilling days, excursion trains brought crowds of visitors from a distance; but the financial exhibit, though fair, was not flattering. The receipts, exclusive of the proceeds of season tickets, amounted to £6,784 3*s.* The corresponding take at Preston was £8,474 9*s.* 6*d.*; at Shrewsbury, £7,088 1*s.*; at York, £9,774 9*s.* 6*d.*; at Reading, £6,017 7*s.* The grounds, lent by Mr. J. J. Colman, Member of Parliament, were admirably adapted for show-yard purposes. The classification of the entries was better than ever before, and the city and railroad authorities had made excellent provisions for enabling the crowds of visitors to enter and leave the exhibition without confusion. The Prince and Princess of Wales, from their neighboring estate at Sandringham, were present three days with a large number of distinguished visitors, and on Wednesday over 60 of the Colonial and Indian visitors to the great exhibition of Colonial and Indian products now held in London, went down on a special train by special invitation of the Society. On the whole, the show is considered a success, though not a brilliant one.

HORSES.

In this home of the Thoroughbred, horses take the first place among domestic animals, and at the Norwich show there were no less than 493 entries, against 438 at Preston and 607 at Shrewsbury. Of these, 78 were Shire horses, 56 Clydesdales, 93 Suffolks, 8 "agricultural horses," 8 Thoroughbreds, 84 hackneys, 35 ponies and 123 hunters. The Shire, or Cart horse of England is a massive, compact, round-bodied animal, with stout limbs, enormously broad chest, and short neck and back. For pulling heavy weights, he cannot be excelled; but his steps are short and his motions slow. It is only of late that any special attention has been paid to his pedigree, the first Shire Stud Book having been published in February, 1880, and the issue of five other volumes since then shows that those interested in this massive race are now fully alive to the importance of recorded pedigrees. Of late years, considerable shipments of this breed have been made to the United States, and breeders here expect to increase the trade as their favorites become better known on your side of the Atlantic.

A short time back a splendid show of the breed was made in London by the Shire Horse Society, and all agree that the display at Norwich was considerably inferior. Most of the prominent studs, however, were represented, though not in some cases by their best specimens.

Of Clydesdales the display was excellent both in number and quality, considering the distance from the home of the breed. Prince Avondale, an easy first prize winner, for whom 500 guineas ($2,550) had been paid, was generally considered the finest animal among all the heavy draft horses in the show.

The short-legged, compact, round-bodied Suffolk, smaller than the Shire or Clyde, and probably the best established of all the British breeds of heavy draft horses, was out in great force, as Suffolk is an adjoining county, and no other breed has ever been so popular there. Moreover, the County Society merged its own exhibition with the Royal, so that the exhibition was certainly the best ever witnessed of this chunky, spirited and resolute breed. Very few Suffolks have ever been taken to the United States, nor have they ever become very popular here beyond the county from which they take their name. The first Stud Book was published half a dozen years ago, and several other volumes have come out since then.

The "Agricultural Horses" class is composed of draft horses belonging to no particular breed, or whose breed is not known. Meg Moir, the first prize winner among "Agricultural Mares," was of the latter class; no one could tell whether she was a Shire or Clyde, which shows that in appearance there is not much difference between the two. Such an admirable animal would be an honor to either.

Among the Thoroughbreds were some remarkably fine animals, but they were exhibited as getters of hunters, rather than as winners of races.

The Hackneys were divided into three classes according to their size and age. The Hackney is a trotter, and Norfolk has long been famous for its trotters, so most of the prizes went to the horses owned there. A Hackney Stud Book was started a few years ago, and the third volume was issued last February by a Society of Hackney breeders now numbering 322. Ponies are very numerous in this country, as the children (male and female) of the "nobility and gentry" are nearly all expert on horse-back, and begin to learn on ponies. Hunters are a valuable class in a country where hunting is an indispensable pastime with a large class of gentlemen at a certain season every year, and a great deal of interest is always exhibited in the display. Some hunters are Thoroughbreds; but as few of these can carry weight, the bulk of the class are half-breds or have a still larger proportion of thoroughbred blood. Many have seven-eighths of pure blood.

CATTLE.

Of the 681 cattle on exhibition there were 187 Jerseys, 146 Red Polled, 82 Short-horns, 73 Herefords, 41 Sussex and the same number of Guernseys, 28 Devons, 25 Welsh and 58 "other breeds" for which there were no classes. These included Aberdeen-Angus, Galloways, Ayrshires, Kerries, etc. There were also 17 cows in the special class of "Dairy Cattle." In view of the fact that Norfolk and the surrounding country is not a "Jersey" section, the large number of Jerseys present was a matter of surprise. At the first Royal Show in '49 there was only a single specimen, and it was not until 1864 that the Channel Island cattle got separate classes at the Royal Shows, and not until 1871 that the Society first divided these cattle into separate classes for Jerseys and Guernseys. The animals on show at Norwich were excellent specimens, and the display will doubtless still further popularize this first-rate dairy breed. It was noticeable that less attention than usual was paid to "fancy points," and more to what you Americans would call "practical" features.

Never before was there seen such a display of Red Polled cattle. This was quite natural, as Norfolk and the adjoining county of Suffolk are the homes of this fine beef-and-milk breed, the reputation of which has been growing at home and abroad of late years. The last time the Royal Show was held at Norwich—in 1849—there were separate classes for Short-horns, Herefords and Devons only, all the other breeds competing together, and at that time this breed was still divided into Norfolk and Suffolk Red Polled, and of these local breeds, only 16 animals were exhibited. Of the eight prizes then given to the miscellaneous class, these breeds took one each, the Ayrshires two, and the Long-horns four. This year there were eight classes of the Red Polled breed alone, with an average of 18 animals in each class. It seems to me that there is still a noticeable difference between the cattle of the two counties. Those of Norfolk have shorter legs, thicker flesh, a deeper color and greater symmetry; while those of Suffolk are larger, a trifle coarser and more of a wedge or "milk" shape. Animals of the latter type were the favorites with the judges, as they took all the prizes. In the class for Aged Bulls, Mr. Garrett Taylor's 10-year-old bull, Falstaff, thick-fleshed, symmetrically shaped, fine in all points, and especially in the rib, took the first prize from 10 competitors, and also the champion prize as the best bull of the breed. This animal was generally considered the finest specimen of Red Polled bulls ever seen in a show-yard. [At Fig. 323, p. 529, an excellent likeness of this champion prize-winner is presented to our readers, re-engraved from the London Live Stock Journal.—EDS] Mr. Colman's Midsummer Rose also won first prize in her class and champion prize as the best cow of the breed, and was an equally fine specimen of female excellence.

The Short-horns, as usual, made a splendid show—nothing extraordinary to be sure, but still, what with any other breed would be so considered. In whatever part of the English-speaking world exhibitions of fine cattle are held, what other breed ever makes so fine a display, both with regard to number and quality, as this cosmopolitan race? It is the standard, the criterion by which all other breeds are judged. Its popularity and pre-eminence are not transitory "booms"; they have stood the test of a century or more. As at Preston last year, Royal Ingram was the champion bull of his breed and he won the same honor again this year, while Lady Pamela won the first prize in the class for cows in-milk or in-calf, and also the champion prize (£25) as the best female Short-horn in show. These names, and many others distinguished at this show, are household words among stock-owners, and especially Short-horn men, in England, but must, I suppose, be strange to ears beyond the water.

Herefords were finely represented, the pick of the best herds in the county being present. The contest for honors was one between prize-winners, for almost every show-yard animal in the Kingdom competed. Usually the White-faces are not seen in full force beyond their own home; but this occasion was an exception. At the Norwich show of 1849, the Hereford bull, Sir David, won the first prize, and his blood now flows in nearly all the winners at the present exhibition—thirty-seven years afterwards. To Hereford men Sir David has become what Favorite has long been to Short-horn men—the source to which the best strains trace their distinguishing merits.

The Devons made a small but select exhibition. This breed is probably the most prepotent in England, having been established

nobody knows how long. Among the winners was her Majesty the Queen, who took first prize with Fanciful in the class for yearling heifers.

The Sussex display was excellent, the average quality of the exhibits being high. As a beef breed, this has many supporters; but in view of the excellence of the Short-horns, Herefords and Devons in the same line, the Sussex is not making much headway outside the county in which it originated.

Guernseys have hardly been treated fairly at Royal Shows. Though specially a dairy breed, just as much as the Jersey, the only class for cows was that for "Cows or Heifers in-milk or in-Calf," calved in 1883. Thus adult cows are excluded from the show. This blunder gave rise to so much just complaint that it is hardly likely to be repeated in subsequent shows. Most of the animals exhibited, especially the bulls, were fine specimens of the breed.

In view of the fact that the show was held at the other side of the kingdom, the exhibition of black Welsh cattle was very praiseworthy. While matured stock of this breed look well, young animals are very ungainly. There are several local breeds of cattle in the different counties in Wales, and a good deal of pains has lately been bestowed on their improvement, with promising results.

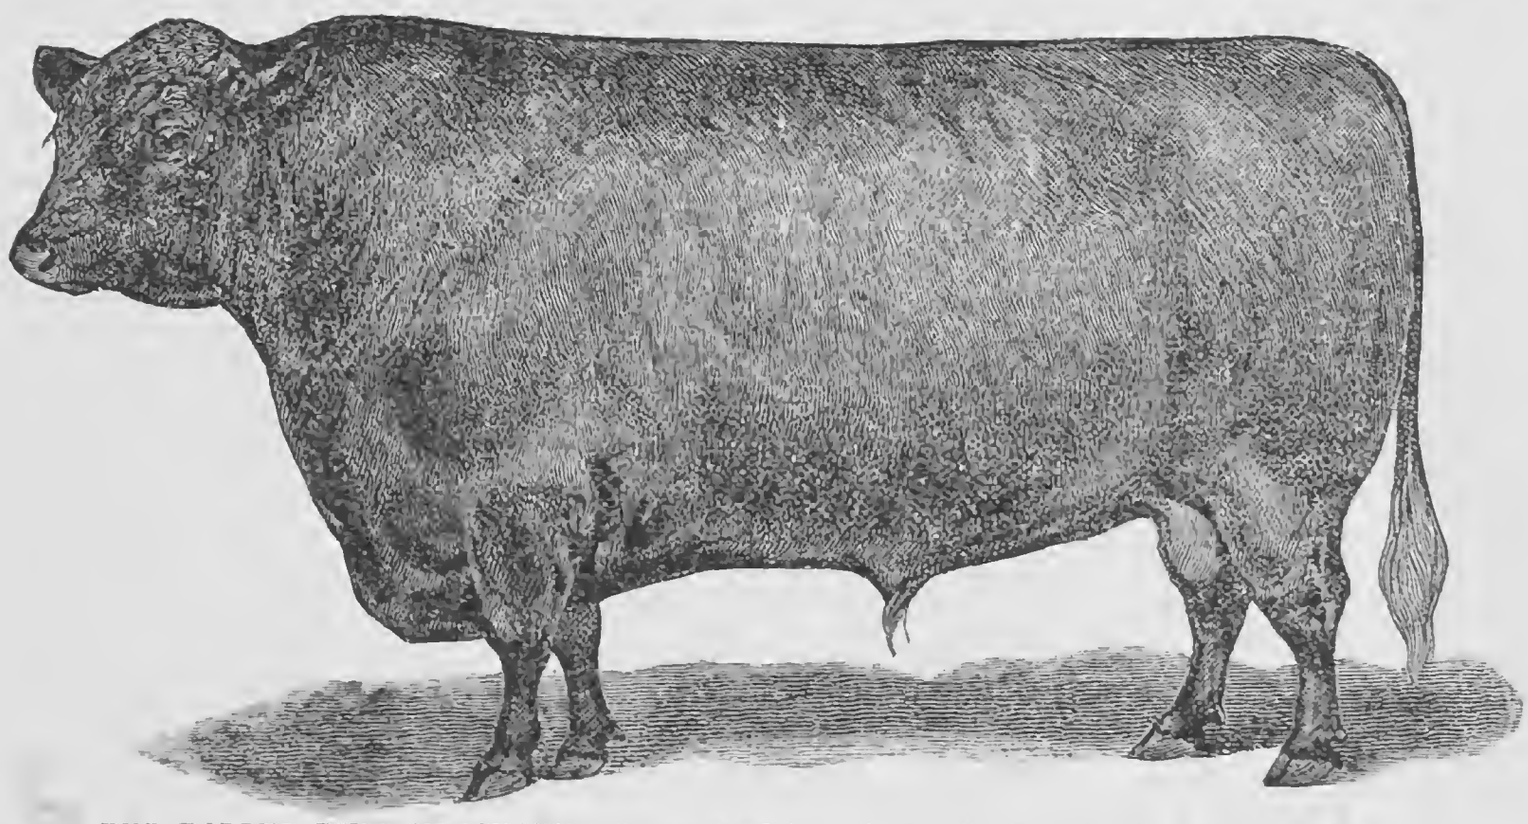
In the class for "Other Breeds," considerable trouble must have been found in awarding the prizes, as it included beef and dairy breeds, natives as well as foreigners. The English Aberdeen-Angus breeders contributed 10 of the 39 entries, and bore away all the first prizes. There were some splendid specimens of this breed, some of them frequent prize-winners at other shows both in England and Scotland. It is thought that the black polled cattle will have separate classes next year. Silver King, a splendid Ayrshire bull, considered by many the best living specimen of the breed, had to be content with a second prize.

In the "Dairy Classes," a preliminary proviso that all competitors, to be qualified, must give 18 quarts of milk, and that the milk must give a total of not less than 12 per cent. of solids, barred out most would-be competitors. The excessive demand for milk shut out some excellent Guernseys, and the high production of solids did the same for several Red Polls. A big Short-horn cow received the prize (£25) for the largest yield of milk—18 quarts one pint in a day, with a 12.11 percentage of solids. The second prize (£15) was awarded to a Red Polled heifer, which yielded 15 quarts and half a gill of milk, with 12.33 per cent. of solids. People in the United States greatly underrate the Short-horn as a dairy cow. Here, where her many merits have been developed, she is the dairy cow *par excellence*. English farmers are quite well acquainted with the Ayrshire, Jersey, Guernsey, Dutch and other dairy breeds; but they prefer the Short-horn. The others, of course, have been introduced to a considerable extent, but with the butter, cheese and milk farmer, the Short-horn and her crosses and grades are the favorites. They yield large messes of milk which is good for any purpose, and fatten readily when turned off for the butcher—always an important consideration with an English farmer. This preference is not a result of prejudice, but of practical experience. Times have lately been so hard for the agricultural classes that they have been forced to economize in many ways, and they would long since have discarded the Short-horn as a dairy cow, were it not that they have found her the most profitable. In America, you have been breeding Short-horns almost exclusively for beef, so that the cows have, to a great extent, lost their great capacity for milk production; but here they have been always bred for milk as well as beef, and have given equal satisfaction in both lines.

There were fine exhibits of sheep and swine, but this letter is already too long.

Just a word, however, as to the future. The next Royal Show will be held up north at Newcastle, and as that country is densely populated a large attendance is expected. The Prince of Wales' third term as president of the society ended with the show, and he has been succeeded by Lord Edgerton, of Tatton, a great territorial magnate who has been a member of the society's council since 1871, and a trustee since 1883. He was born in 1832, and was Member of Parliament from 1858 to 1883, when he succeeded his father to the barony, and took his seat in the House of Lords.

London, July 19. HERBERT LANGDALE.



RED POLLED BULL FALSTAFF. Re-engraved from the London Live Stock Journal. Fig. 323.

What Others Say

KINDS OF GRASS SUITABLE AND UNSUITABLE IN KANSAS.—In his late report Prof. E. M. Shelton, of the Kansas Agricultural College, says that in general, it may be said that no grass or clover can be permanently successful in Kansas that has not the ability to withstand high temperatures and droughts as well as severe freezing. Such peculiarly Southern sorts as Johnson Grass and Bermuda Grass are totally worthless in Kansas, because if not wholly destroyed by the severity of the Winters, they are so completely crippled as to be of no practical value. In the course of a long experience with tame grasses in Kansas, the idea has steadily grown with Prof. Shelton that Orchard Grass is generally the best and most useful grass, and that for mixed pasture and mowing ground Orchard Grass and Red Clover have a position in Kansas as permanent as that held by Timothy and clover further east. Alfalfa is also sure to be a favorite with Kansas cultivators, although a wider experience is needed to determine accurately its place. Of the many other sorts favorably known in different localities, and which have been the subjects of persistent trial upon the College Farm, not much needs to be said. Timothy, though uncertain, frequently gives a large yield of valuable hay, but it suffers from dry weather and insects (particularly chinch-bugs), and it gives no pasturage worth mentioning. Kentucky Blue Grass is a persistent grower in Kansas under almost every circumstance of climate and soil. It will in time drive almost every other sort from the soil in which it gets foothold. Despite these good qualities, it is, except for lawns, of little use to Kansas farmers. It yields no hay, of course, and the amount of pasturage yielded by it is inconsiderable. Perennial rye-grass (Lolium perenne), although repeatedly tried, often with good prospects of success, has never survived the second winter. Tall Meadow Oat-Grass (Avena elatior) is, on many accounts, a useful grass. It gives very early and excellent pasturage, and a stand with it is easily obtained, but the yield of hay is light and apparently not very palatable, and it suffers greatly from "dry spells." Common White Clover starts early in the Spring, and for a time makes abundant pasturage; but as the Summer advances, it fails rapidly, frequently perishing, but re-seeding and almost certainly reappearing the following Spring. A stand of Red-top has proved quite difficult to secure doubtless on account of the smallness of its seeds. Except in swales, or other like moist situations, this is not a promising sort. Many other sorts might be referred to, but the list given embraces nearly every kind that is likely to be the subject of trial in Kansas.

PRUSSIA.—Prof. Budd, of Iowa, says that the farmers of America are not educated to the point where they appreciate the value of agricultural education. The little kingdom of Prussia has 68 technical schools, and there are openings for all the graduates. The editor of the Review notes that Prussia has a population less than that of the State of Ohio; but this is a gross mistake. According to the census of 1873, the population of the "little kingdom of Prussia" was even then 24,693,497; while that of Ohio, according to the census of 1880, was then only 3,198,062. The area of the "little kingdom of Prussia" is 134,493 square miles; that of Ohio is only 39,964 square miles, being in size the 23d of the States in the Union. In the Kingdom of Prussia one of the provinces bears the same name, being the original nucleus around which later additions accumulated. This has an area of 24,114 square miles, and had in 1874 a population of 3,137,540—a much denser population than that of Ohio. But this Province must not by any means be confounded with the Kingdom.

COST AND VALUE OF SOME FERTILIZERS.—According to recent valuations of fertilizers sent to the Connecticut Experiment Station, Peter Cooper's pure bone dust, which cost $32, was estimated to be worth $42. James Green's (N. Y.) Common Bone, which cost $25 per ton, was valued at but $12.90. Quinnipiac boue meal (New London, Conn.), which cost $38, was estimated to be worth over $39 per ton. Here is a further list of those fertilizers which cost over $8 per ton more than they ought to cost:

	Cost per ton.	Valued at
Adams & Thomas' (Springfield, Mass.) Market Bone	$38.00	$30.46
Victor Phosphate A 1 (Waterbury, Ct.	35.00	26.27
Baker's (N. Y.) Complete Potato	45.00	33.00
Bowker's (Boston) Ammoniated Bone Superphosphate	36.00	27.40
Stockbridge Vegetable Manure (Bowker & Co.)	45.00	34.43
Bradley's Patent Superp. (Boston)	38.00	28.66
E. Frank Coe's High-grade Ammoniated Superp.	34.00	26.65
Common-sense Fertilizer No. 2 (Boston, Mass.)	35.00	18.80
Cecrops or Dragons' Tooth Fertilizer (Newton & Ludlum, N. Y.)	40.00	31.29
Cereal Fertilizer (same)	34.00	24.70
Cooke's Blood Guano (Read & Co. N. Y.)	37.00	23.94
Charter Oak Fertilizer (P. Thomson, Hartford, Ct.)	30.00	15.77
Quinnipiac Fish and Potash—crossed fishes brand—(New London, Ct.)	38.00	27.98
Wilkinson's Patent Ammoniated Superphos. (N. Y.)	38.00	25.69

NO HARDY BLACKBERRY.—Pres. Lyon says, in the Michigan Farmer, that the most popular so-called hardy blackberries, Snyder, Taylor, Stone, and others, failed of a crop last season, from injury by the previous winter's cold, while those who relied upon the confessedly tender Lawton and Wilson, by protecting the plants at a very slight expense, reaped a heavy and highly remunerative crop. From this and other experience he has become thoroughly convinced that a strictly hardy blackberry is yet unoriginated, if not in fact unattainable, and that the sooner we abandon such expectation the better for all concerned.

RURAL LIFE NOTES.

OUR Canadian friend, Prof. Brown, in selecting a dairy cow prefers a long face, especially from the eye downward, also a wide nostril. He likes a cow with a face that will hold water when brought to a horizontal position, but would avoid a dish face on a bull. He likes a flattish or oval horn rather than a round one, but likes far better to see no horns at all. Horns are not needed upon cattle kept in domestication. We do not want our animals to fight each other. A cow's neck should be lady-like, not heavy and masculine. The idea of a general-purpose cow is in a measure absurd, yet there is something in it, he thinks.

IF a heifer calf has a head and neck like a young buffalo, a skin covered with shaggy hair and milk veins that are conspicuous by their absence, don't keep her even if her pedigree is as long as from Dan to Beersheba, says the Kansas City Live-Stock Journal.....

THE Seattle (W. T.) Daily Post Intelligence publishes an article justly complimenting the Trans-Continental letters with which Mrs. Fisher has favored this journal. "Active in the bustling business of a Western life," the article begins, "we are apt to overlook the help of many a friend who, by mouth or pen, renders us a service the benefit of which cannot be calculated. The RURAL NEW-YORKER —probably the best agricultural paper in America—published in its number of June 5th, a portrait and autobiographical sketch of Mrs. Mary-Wager Fisher. The editor takes advantage of this occasion to pay a fitting compliment to the lady, who has been a valued correspondent from the time she was a girl 15 years of age."... . ...

A BILL now before Congress—but which can hardly pass—provides that ranging cattle is unlawful, and that if cattle ranging on the public domain trespass on the unfenced land of settlers, the owners of the cattle shall be liable for such damages as may be done.....

ALL stock driven into Her Majesty's dominions of the Northwest must cross the line before Sept. 18, or pay a duty of 20 per cent....

A COMPANY has been incorporated at St. Paul, Minn., with a capital stock of $1,000,000 to build stockyards, sheds, etc., for the feeding and slaughtering of cattle, sheep and swine. It will be known as the St. Paul Union Stock Yard Co.....

KANSAS CITY beef sells in New Mexico for 25 cents a pound, alongside of beef of local production at 15 cents. The Socorro Bulletin says: "Well, the fact is that the average of New Mexico beef from range is poor, thin and lean. But when fat, the beef is just as good and juicy and palatable as Kansas City beef. The trouble is we do not produce enough of fat beef. It looks as though, in many instances, the ranges are overstocked. In any event there is money in raising Alfalfa and other grasses, and establishing feeding farms. We repeat, there is money in it! Think of it!"...

C. M. HOVEY tells the London Garden that he has fruited more than 1,000 varieties of pears in the last 40 years. He has in bearing more than 100 kinds.....

WE have been watching a man gathering sweet corn. He twists off the ears, and in so doing breaks the stalk of about one plant in five. Is that economy?.

WE hear fine accounts of the Earhart Everbearing Raspberry. We shall have our say ere long..... ....

MR. MEEHAN, of the Gardeners' Monthly, elects the Hyacinth President of the Bulb Republic. He speaks of Hyacinthus candicans as well worthy of cultivation for its own beauty, as well as because it may be the parent of a new class some day. We must say that as to beauty, we see little in it to admire, and the odor of the flower is disagreeable. With us the flowering stems grow about five feet high, bearing about 25 drooping, bell-shaped flowers that, though smaller, resemble those of Yucca filamentosa. The flowers are at their best now (July 26)..... . ...

THE experiments of Prof. Shelton, of the Kansas Ag. College, with pasturing pigs, show that they could not be induced to like Orchard Grass. The field contained both Alfalfa and Orchard Grass, and while the former was closely cropped, the latter was always luxuriant and abundant..... ....

OTHER experiments show that cooked corn fed to pigs is less useful than the raw grain, and the conclusion is arrived at that the cooking is an injurious process, so far as its use for fattening animals is concerned..... .....

THE experiment to determine which is the better feed for beef-making, corn-meal or corn-and-cob meal, was repeated, and again resulted in favor of the corn-and-cob meal; but until Prof. S. can find a machine that will economically reduce ear-corn to the condition of a fine meal, he will prefer to use the clear corn-meal as a stock food. When the right mill is found, he is equally confident that he will use the corn-and-cob meal.....

WHAT is there peculiar in your crops, RURAL readers, this season? How do you account for it? Did you raise an unusually large or small crop of potatoes, wheat or rye? What was the reason? We want our readers to tell us about such things for the good of all.....

WE learn by the College Speculum (Michigan Agricultural College) that our associate editor of several years ago, C. C. Georgeson, has arrived in Japan and entered upon his duties as Professor of Agriculture, and likes it much thus far.....

PROF. ARNOLD says that the best way to remove grubs from a cow's back in Spring, is to enlarge the opening made by the grub enough to admit of pulling it out, and then draw it forth with a small hook, such as might be

made by bending up the point of a large pin. The grubs can be easily killed in their nest by touching each with a drop of kerosene on the end of a pointed stick, but a long and tender sore will follow before the grub will rot out so as to allow the sore to heal.....

PROF. MAYNARD finds pyrethrum a very valuable insecticide for destroying cabbage worms, plant lice, currant worms, etc., says the N. E. Farmer: but he finds it more economically used when mixed with plaster-of-Paris, as the mixture can be spread further and appears equally effective. For many kinds of plant lice he uses one part pyrethrum to four parts plaster, and on cabbages he uses nine parts plaster and rids the plants completely of the green worms. We wish Prof. M. would state whether he has reference to the imported article or the California Pyrethrum sold under the name of Buhach... .....

ACCORDING to a table prepared by the Farmer's Review, the following are the colors of prize ribbons on winning animals at the fairs mentioned:

STATE.	WHERE HELD.	COLORS,		
		FIRST.	SECOND	THIRD.
Kentucky..	Lexington...	Blue.	Red.	None.
Ohio.....	Columbus...	Red.	Blue.	White.
Indiana.....	Indianapolis.	Red.	Blue.	White.
Michigan...	Kalamazoo..	Blue.	Red.	White.
Illinois.....	Chicago.....	Blue.	Red.	White.
Wisconsin..	Madison.....	Blue.	Red.	Cream
Minnesota..	St. Paul.. ...	Blue.	Red.	White.
Iowa.....	Des Moines..	Blue.	Red.	White.
Nebraska...	Lincoln.....	Red.	Blue.	Yellow
Kansas.....	Topeka..	Blue.	Red	White.
Dakota.....	Huron	Blue.	Red.	White.
Montana	Helena... ...	Blue.	Red.	Green.

There certainly ought to be uniformity in these matters, otherwise, as noticed by the Breeders' Gazette, an Illinois animal returning from Indianapolis with a red ribbon would be set down, by most people, as a second-prize winner, and, of course, the same would be the case with regard to other States also.....

ABOVE the din of the conflict, says the U. S. Dairyman, might be heard the voice of science as it is the voice of common sense, saying as Prof. Arnold has lately said, that the farmer may rely on the truth of the statement that a cow decidedly poor for butter, is also poor for cheese production.....

"ALL of our kinds of wheat belong to one species, and therefore cannot be hybrids one with another. They may be cross-bred." So says Prof. Beal, in the Michigan Farmer. The attention of the Ag. Ed. of the Weekly Press is called to the above paragraph.....

MANY thousands of farms in the West are mortgaged to Eastern capitalists, who extort 10 per cent. interest for the loan, says the Orange County Farmer. This is a most outrageous rate. Ten years of interest-paying and the entire amount of the mortgage has been paid, but they owe it all the same...

THE tomatoes of the Editor of the above journal, which are neatly trained to pole, had grown six feet by June 16, and the fruit was beginning to ripen. His Turner's Hybrids were a curiosity, their foliage being so different from that of the standard sorts. On some plants of this sort, the fruit is very badly wrinkled, while on others they are very smooth and fair. The Editor must have written June for July. It reminds us that for several years we trained both red and yellow tomatoes to the barn, and the vines grew about 15 feet high, bearing an abundance of both yellow and red tomatoes ....

As to Turner's Hybrid, the Editor may be interested to know that we have planted three different lots of tomatoes under differnames all of which are the same, viz: Mikado, Turner's Hybrid and plants sent to us by Mr. Livingston of tomato fame.....

OF thirteen varieties of grasses sown late this Spring, May 15, by Mr. Stiles, Tall Oat Grass has made the most vigorous growth, standing straight up two feet high.... ....

JOHNSON GRASS—Sorghum halapense -has become an inexterminable pest in some parts of California, says The Rural Press. The farmers find that as they tear the roots in pieces each one sets up on its individual hook for a new plant, so that the more it is hacked and hoed the more it spreads. The Press gives an illustration of a potato which has been pierced clean through by a millet root. This indicates a murderous energy beyond that of any weed with which we are acquainted.

We find the above in the Philadelphia Weekly Press. In at least a dozen cases we have had our potatoes "pierced" by Quack, Couch, Quitch, Quick or Rye Grass—Triticum repens. Speaking of Johnson Grass reminds us that a little patch sown four years ago in a corner of our garden is now five feet high. In this case cultivation prevents its spreading.....

PROF. SANBORN, of the Missouri (Columbia) Ag. College, prefers Fultz to any other kind of wheat, though he has tried 150 kinds.....

TRIALS with flint corn have always given Prof. Sanborn as much corn when it is put into shocks at the glazing period, as when allowed to ripen on the stalk. The dents must be well dried, he thinks, to the center, before cutting up the stalks.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LX.

MARY WAGER-FISHER.

A nursery near San Francisco; bearing ages and prices of fruit trees; California grape-growing; Chinese and white labor; the rainy season; malaria; the "glorious climate" of California.

WE went one day to visit a large nursery a few miles out of Oakland, and found that the foreman had come from Ellwanger & Barry's, Rochester, New York. He very kindly gave us considerable information, of which I made notes at the time, as being of possible interest to RURAL readers. The nursery contains 200 acres, and the number of shipments of trees last year was half a million. For long distances the trees are packed in tule—a tall, coarse growth of marsh land. For more delicate packing, considerable Oregon moss is used. More fruit trees have been planted within the last two or three years than in the previous 20. The greatest foe to fruit trees is a spidery-looking insect known as the San José scales—a scale forming over the insect—and as yet no effective remedy has been found beyond burning the tree. This scale destroys a tree in about three years. The one fruit tree which it has not yet attacked is the Black Tartarian Cherry. Trees are delivered, as a rule, one year from the bud.

Deciduous trees remain dormant from two to three months, while evergreens grow all Winter. Apple trees bear at ten years of age (from the seed); apricots and cherries at four years; pears at five; peaches at six(?); and oranges at eight years. Apple trees sell for $12.50 per 100; grapes range from $8 to $40 per 100. Three hundred varieties of grapes are raised in this nursery, but there are about 400 varieties in the State. Wine growers put in their own cuttings where they are to remain, and all grape stocks are cut very low and so kept that a California vineyard is a very prosaic-looking spectacle. The California seedless raisin is said to have originated at Riverside, near Los Angeles, and is mostly cultivated in Fresno. But very fine raisin grapes are raised in many parts of the State, and the drying is largely done in the open air. Apples have been invariably inferior as to quality, and the foreman spoke of eating a Bellflower which was about equal to eating a sponge. The great hindrance to fruit-growing has been the cost of transporting fruit by rail, and last year it cost $600 a car to freight it East. This year the cost will be not over half those figures.

In this nursery at the time of our visit 18 white men were employed, and from 30 to 40 Chinamen. The latter do budding and grafting, and weed and hoe. For the plow a white man is required. The Chinamen were paid 80 cents per day and boarded themselves. The white men were being paid 75 cents a day and board, their usual wages, however, being $30 per month with board. The foreman said that in New York $1.25 were paid for the same work. He was evidently not friendly to Chinese labor, and we questioned him as to their employment. "The trouble with white men on this coast," he said, "is that they drink, and can't be depended upon. They are worth more, and are in the long run cheaper;-but employers can't depend upon them in pressing times, as upon the Chinese. For the latter we always have a white foreman, and as for honesty, they are not as conscientious as the lowest of the whites. We can't leave a knife or a tool about but they will appropriate it, if they can. They do exactly as you tell them to do, never varying their methods according to circumstances."

This nursery is in Alameda County, in rather a sheltered locality, near the bay. The foreman said that the mercury rarely fell below 28 degrees above zero. In some localities, such as Fruitville, near Oakland, where the elevation is greater, frost is comparatively unknown. The shipping of trees from the nursery begins in November, and planting continues during the Winter—called Winter because it is the rainy season on the coast. For cold and snow, one must go into the mountains. California has 20 different climates—the climate depending altogether upon the locality. It must not be inferred that during the rainy season it rains continuously. When it rains, however, the fall is heavy and steady, succeeded by days of cloudless skies, so that Winter is by far the most agreeable season.

As the RURAL in answer to some inquiry in a February issue concerning California climate, stated there was no malaria on the coast touched by the sea breezes, it may not be amiss for me to say that Californians suffer greatly from malaria, even in San Francisco and some parts of Oakland. This may be due to bad sewerage alone, but the practice of irrigation in most parts of the State, breeds malaria—at least this explanation is offered for its prevalence.

The equability and mildness of the coast climate are altogether delightful. But after a few years' residence so various persons have assured me—the physical system suffers from lack of the tonic that is supposed to belong to a marked change in the seasons—the snapping cold and terrible blizzards of the Eastern Winters. As for myself, I am very sure I should tire of the sameness of things—unending flowers the year around and eternal beauty. The popular idea of heaven is to me wearisome in the same sense. But this is to be said for California mildness—one need not lose any time in trying to keep warm: I think in the East, too much time goes in shoveling in coal, piling up wood, thawing ice and removing snow—work that has no permanent value. I think, too, California is a good climate for intellectual activity. Business men complain that it is peculiarly hard on them, as there is no dull season for a vacation, but one unceasing grind. Wherever the sun shines it is warm; wherever it does *not* shine it is damp and cold. A little fire is needed in San Francisco, for example, the year around, particularly in the morning and evening. The women make more distinction in dress—there are fewer seal-skin coats and lace shawls brought into juxtaposition in the streets in January, than formerly.

RURAL SPECIAL REPORTS.

Canada.

ST. GILES, July 27, 1876.—The frost of last Winter was so severe that neither strawberries, raspberries, gooseberries, nor, in fact, any newly planted shrubs or canes came through, and the ground was frozen to a depth never seen before; but, strange to say, comparatively little grass was winter-killed. The snow went away very early and we had a dry Spring, so that the work was done early and a great deal of grain was put in, but in very bad order, there being no rain at all until June 17. The first inch or so on top dried, but the remainder was too cold; in consequence the ground was quite lumpy and hard, and we have a very poor stand of corn and potatoes. My potato field is a river bottom, and I have lost certainly one-quarter of my seed. From June 17 when we had a day and a night of rain, we have had a succession of showers; but never enough to saturate the soil. Except on two occasions in June, when for three or four days the thermometer marked up to 100° to 106°, the weather has been quite cool. Everything is quite late. On the first of July last year we had potatoes and other vegetables in abundance; as yet we have only lettuce, radishes and peas. I generally commence haying on July 5 or 6; now Timothy is only fairly in bloom: there will be rather above an average crop. All the grains, of which there is rather more than an average quantity sown, are splendid, oats especially. I expect fully one-quarter more than an average. Late roots look well. Stock is in splendid order, but everything is much too low. Pork, $3 50 to $5.00; beeves and sheep can scarcely be sold; butter from 8 to 12½ cents; eggs were 13 cents till last week; now they are 15. Old potatoes went down to 15 cents. Garden truck commands somewhat better prices, but we have little to sell as yet.

Georgia.

SOCIAL CIRCLE, Walton Co., July 31.—The RURAL melons all did well. Peas a grand failure for this climate. Flower seeds gave great satisfaction. Angel of Midnight Corn, planted April 20, is now matured, and a second crop has been planted. Longest ears, 10½ inches; 364 grains to the ear. Who excels that? Corn on low lands a failure; on up-lands, good. Cotton, poor, M. R. S.

Illinois.

PLEASANT VALLEY, Jo. Daviess Co., July 26.—Some of your surplus rains would be highly prized here, though during last Summer and Winter we got more than our share. On May 12 a severe hailstorm passed over this section from four to six miles wide, killing many young pigs and other stock. Many hailstones were from three to three-and-a-half inches in diameter. It was thought then that wheat was ruined, but both spring and winter wheats are fine crops, though they did not stool much—heads well filled with plump grain. Since then we have had two showers, but no soaking rain, and lots of hot, smoky weather. Hay is nearly all cured and stacked, and though a light crop, there has been more first-class hay secured than ever before in one season. Many are feeding hay to their cattle, which are thin in flesh. Creeks and wells are not so low as in some former seasons, but the surface is parched so that the stubble in some meadows would burn over if set on fire. Corn is in tassel and looks bad. Fruit mostly spoiled by hail and drought. Hottest day, July 6th, 105 degrees in the shade. Potatoes, 50 cents to $1 per bushel; oats, 25 cents; corn, 30 cents; wheat, 70; live hogs, $3.50 per hundred. W. S. S.

Michigan.

SILVERCREEK, Cass Co., July 31.—It has been very dry this season in Southwestern Michigan, but not so dry as in other localities, for we have had a few sprinklings to moisten the parched ground; still we are pretty nearly dried up. If we could have rain even now, corn that is not too far gone, and late potatoes would be helped. Wheat crop a good one. Those that have thrashed report a yield of from 20 to 40 bushels to the acre and of splendid quality. Oats are light on account of the dry weather. Fruits of all kinds plentiful. Apples have fallen off badly owing to the hot weather. The blackberry harvest is now in full blast; a fair crop considering the dry weather. Clover seed will be scarce in this part of the country. Pastures are almost entirely dried up, and cows are shrinking in their milk. Some farmers are feeding their cows mill feed-bran and meal. Hogs are being shipped out of this county at a rapid rate, owing to fear of failure of our corn crop. Buyers are paying from $3.75 to $4.25 for them, according to quality. The people of Niles District are making preparation to attend the camp meeting at Crystal Spring, commencing August 10th and lasting 10 days. A great many of our farmers go there to spend a few days in the woods and rest from the every-day toils of the farm and to enjoy the meetings. From 1,500 to 2,000 people take up their abode on the grounds. J. M. F.

Montana.

BOZEMAN, Gallatin Co., July 25—Stockraising is so nearly the exclusive business of this whole section that no other industry attracts wide interest. All our talk is about the condition and outlook for stock in this neighborhood, and in the other parts of the Territory tributary to this place. On account of the severe and continued drought the grass is much shorter and drier than ever before known at this season. Cattle are not suffering to any great extent now, but grave fears are entertained regarding the coming Winter. If the snow should be deep great loss will inevitably result. The shortness of the grass has driven the stock out on the uplands and the usual winter ranges, so that the outlook is somewhat discouraging. If heavy rains should fall early next month it would materially change matters for the better. It would start the grass to a vigorous growth before Winter sets in. L. H.

North Carolina.

HENDERSON, Vance Co., July 26.—The excessive rains of June and early July injured all, or nearly all, crops. Where not directly injurious, they prevented proper cultivation, consequently much corn is "laid by" well set with grass and weeds. We never had finer weather than the past 10 days, and with occasional showers expect average corn, cotton and tobacco crops. Grapes light. Apples and pears better than last year. Watermelons drowned, especially the early planted and those on low lands. Will commence shipping grapes this week; a few sour Champions already gone. Some of our grape-growers are so crazy to be first that I think they injure the reputation of our fruits by shipping them before they are ripe. M. B. P.

ROCKY POINT, Pender County, July 30.—The huckleberry (whortleberry) crop of this county is immense this year. The berries are large and perfectly sound and the bushes are loaded down. The gathering and exportation of this crop is now one of the moneyed industries of Pender, Sampson, New Hanover, Cumberland, and several other counties in Eastern Carolina. During the past six weeks the huckleberry fields and swamps have been crowded with negroes, who have deserted the cotton and corn fields for the increased wages they get for these berries. Great quantities are eaten here, and more still are expressed North for immediate consumption and to be put up as other canned goods. The swamps whence these berries are obtained are incapable of drainage, and the money from this source is all the revenue obtained by the owners from these swampy lands. R. M. L.

Ohio.

DENT, Hamilton County, Aug. 3.—Wheat is all harvested, and the early sown is yielding well. Clover, a large crop; Timothy, three-quarters of a crop. Potatoes and oats good. Corn promises to be a fine crop. Weather dry, but threatening rain soon. Pears and apples about half crops as compared with last year. The experience of E. D. C., page 467, with the Alaska Pea is the same as mine. The rest of the RURAL seeds are all right. J. H.

Pennsylvania.

CHAMBERSBURG, Franklin Co.—Business in the Cumberland Valley is very good, and the crop prospects haven't been better in years. In some respects this is the best farming section in America. J. H. G.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

THE COW KILLER INSECT.

L. P., Palmer, Col.—What is the strange, stinging insect, a specimen of which I send the RURAL in a box. It is quite common here and is always found traveling on the ground as if in a great hurry. It has no wings. When teased it squeaks like a mouse.

ANSWERED BY PROF. A. J. COOK.

This ant-like, wingless insect with a formidable sting, is the cow-killer (Mutilla coccinea) of the South and West. I have received this insect from Southern Illinois and south as far as Texas. It is reported in some sections to be a serious enemy of the bee. It is said that it enters the hives and fearlessly attacks the bees and feeds on the brood. The female is hairy and looks somewhat like a wasp devoid of wings. The male has no sting, but has wings. The specimen sent is a female. She is an inch long, quick in her motions, and is marked with red and black as follows: The top of her head, thorax and the base and tip of her abdomen are red, while the remainder of her body is black. It seems strange that this insect can safely enter a bee-hive; but her hard crust makes her secure against the savage darts of the bees. Mr. P. speaks of the noise which this strange insect makes when disturbed. I received the insect alive and plainly heard it making the noise when I could see that there were no movements of legs, mouth-parts, antennæ or segments of abdomen. I am led to conclude that the sound comes as a result of forcing air through the spiracles; in other words, that it is a real voice.

FERTILIZING CORN.

L. S., Thibadeaux, La.—1. Will not corn produce a larger yield if fertilized successively, the fertilizer being each time placed farther from the stalks where the roots can take it up, than by simply enriching the ground at the time of planting? 2. Shouldn't the last application contain a large amount of phosphoric acid to make the large ears?

ANS.—The plant food of fertilizers is (or should be) in a highly soluble condition. If much rain occurs in the earlier part of the season, much is washed through the soil and lost to the crop. Again, if fertilizers are applied late, and dry weather follows, the corn will receive little benefit. When the trouble of subsequent applications is considered, we should prefer to spread our fertilizers before the corn is planted, though in some cases the crop might be materially increased by subsequent application. 2. There is little danger of giving land too much phosphate, still, if it needs potash and nitrogen as well, the land *must* be supplied with all, and it needs them *all* while the grain is forming more than at any other time. We should use a fertilizer containing three per cent. of ammonia, 10 per cent. of phosphoric acid and three per cent. of potash, at a venture, not knowing in what the land was rich or poor. Other questions will be answered later.

ASPARAGUS CULTURE.

R. W. W., Knob Lick, Mo.—I want information about asparagus culture. I sowed some seeds in Spring, and don't know what to do next.

ANS.—Did you sow the seeds in the bed where the plants are to remain? If so, keep this bed free of weeds until Fall. Then apply a heavy mulch of well-rotted manure, and in the Spring thin out the plants so that they will be two feet by four apart. If they are not intended to remain in the seed bed, then enrich a plot of the proper size. You need not fear spading under too much manure. Spade up the soil as deep as you can, and set the plants just so as to cover the crowns. This may be done in November or next Spring.

KILLING SORREL.

B. B., (address lost).—One of my fields is covered with horse sorrel, and I cannot get rid of it nor get seeding to catch; what can be done to kill the pest?

ANS.—Try this: plow the land deep this Fall. In the Spring plow shallow. Spread three bags of kainit and two of raw-bone flour to the acre and harrow in. Nitrogen in the form of nitrate of soda might be added—say 100 pounds to the acre, besides that contained in the raw bone. If our friend can afford to spread farm manure, do so in the Fall *after* plowing, and allow it to remain on the surface all Winter. We are presuming the land is level.

STRAIN OF HOCK IN COLT.

A. B. T., Monticello, Ia.—My three-year-old colt has been somewhat lame all the time, and sometimes she has been hardly able to walk owing to a strain in the hock-joint while playfully racing about this Spring. Applications of liniment and Kendall's spavin cure did no good. Blistering relieved the lameness for two weeks, but it returned as bad as before. She has been running to pasture until the last week, when I thought it better to tie her up. How should she be treated?

ANSWER BY F. L. KILBORN.

If you had repeated the blister a few times, and kept the colt quiet, you would probably have cured her. Apply a Spanish fly blister to the swellings and over the point of the hock. As soon as the effect of the blister has passed off, repeat until all lameness disappears. If a puffy swelling still remains, paint it twice a week with tincture of iodine. Keep the horse in a box-stall or small yard where she *cannot run* for at least two months after recovery Feed grass or other laxative food.

NAIL IN HORSE'S HOOF.

"Subscriber" (no address).—Two weeks ago a horse stepped on a nail which entered the foot about half an inch, and she has been lame ever since. I cut into the foot, and the sore is wet from matter oozing out. What shall I do for her?

ANS.—Pare away the horn around the opening to allow free escape of the matter. Wash out with an astringent, antiseptic wash (chloride of zinc or sulphate of copper, etc., one-half dram in a quart of water) and stuff with tow rolled in tar. If necessary put the foot in a small sack to keep the stuffing in place, and to keep the foot clean. Keep the animal quiet in a small yard or pasture until fully recovered.

BLOOD SPAVIN.—BOG SPAVIN.

A. H. T., Jamesport, L. I.—1. What will cure a blood spavin on a farm horse? 2. Are advertised spavin cures any good.

ANSWERED BY F. L. KILBORN.

1. Blood spavin is simply an enlargement of or dilatation of a vein which crosses the seat of spavins, and does not cause lameness. Treatment is not advisable. If your animal is lame it is due to some other cause. A fluctuating swelling on the artero-internal aspect of the upper part of the joint would indicate bog spavin, due to inflammation of the hock-joint proper. In treatment, first subdue active inflammation, if present, by fomentations and rest, and then blister extensively or preferably in five points. 2. While some advertised "spavin cures" may possess merit, others are worthless. As a rule we cannot recommend "patent specifics" of any kind.

ABSCESS IN A COLT.

S. F. R., Brogneville, Pa.—My eight-weeks-old colt has a yellowish, sticky discharge from the urinary organs, but it isn't urine. What should be done?

ANSWERED BY F. L. KILBORN.

There is evidently an abscess, the nature and cure of which we cannot tell from your description. If you can reach the cavity or surface from which the discharge comes, wash it out daily with a weak solution of chloride of zinc (one-half dram to each quart of water), or carbolic acid, one part acid to 50 parts water. After a few applications, dilute the wash one-half, and continue until all discharge ceases.

GARGET IN A COW.

H. R. R. (no address).—How many drops of tincture of aconite is a dose for a cow troubled with garget, and how much saltpeter should be given with it? How often should the dose be given?

ANS.—Tincture of aconite, 20 to 40 drops; salt-peter, one to two tablespoonfuls. The size and frequency of the dose should vary with the fever. In ordinary cases 25 drops of aconite tincture and one large table-spoonful of salt-peter, three or four times daily. With little or no fever neither is required. Special attention should always be given to the manipulation of, and local applications to the udder.

RUPTURE IN A COLT.

J. W. O., Cora, Pa.—What can be done for a rupture just forward of the navel in my sucking female colt?

ANS.—Return any protruding organ after carefully washing with a one per cent. solution of carbolic acid or other disinfectant; stitch the edges of the rupture together with white silk or cat-gut, and apply a bandage around the body until the rupture is healed. Dress as an ordinary wound. Keep the animal as quiet as possible. Are you sure the rupture is not *at* the navel?

TREATMENT OF KNOCK-KNEED COLT.

C. H. F., Queenstown, Can.—My eight-weeks-old colt has been weak in the front legs since he was a week old; and is now knock-kneed; how should he be treated?

ANS.—Apply splints to the limbs to keep them in the natural position, until able to go without them. See that the mare gives plenty of milk. Such colts sometimes entirely recover, but very frequently they are not worth working over, being constitutionally weak and not easily strengthened.

BRITTLE HOOFS IN A COW.

A. B. D., Edgerton, Kans.—The hoofs of one of my cows are all cracked in several places, and a part of one has fallen off, and more threatens to do so. They are as brittle as if burnt. She runs in the same pasture with the other cows, none of which are affected in the same way. What is the matter?

ANSWERED BY F. L. KILBORN.

There appears to be a natural predisposition to brittleness of the hoof, which may or may not be aggravated by unknown general or local causes. Try keeping the whole hoof well covered with an ointment of equal parts of tar and lard or vaseline. Around and just above the top of the hoof, apply a blister of equal parts of oil of turpentine, ammonia and linseed oil. Repeat once a week, or often enough to keep the hair standing erect, but not sufficiently to raise a scab.

BLOATING IN A CALF.

F. H. B., Dudley, Wis.—Every time I feed a four-weeks-old calf, she bloats up and acts as if she was in great pain. Whether I feed new milk, skim-milk or hay tea, the effect is just the same. What should be done?

ANS.—Feed often and in small quantities. At each feed, add two or three tablespoonfuls of lime-water. As soon as the difficulty is checked, gradually diminish the dose and finally cease giving, if the trouble does not return.

Miscellaneous.

X. Y. Z., Madison, Ind.—My eight-year-old mare has, at times, gone lame for the last two years in front. Her feet show fever and the hoof gets as hard as a shell. She goes as lame on soft as on hard ground. Her shoulders appear perfectly sound; and all say she is not foundered, nor are her hoofs contracted. What is the matter?

ANSWERED BY F. L. KILBORN.

It is usually impossible to diagnose such obscure lameness from description. In the present case navicular disease is suspected, but we cannot state definitely. If such is the case, and being of so long standing, treatment would probably be unsatisfactory, and any treatment that would be most likely to be successful would require the service of a veterinary surgeon.

J. H. S., Hillman, Mich.—A short time ago the ends of the limbs of an apple tree were literally covered with small green lice. I put half a tablespoonful of Paris-green in a pail of water and sprinkled the tree thoroughly with it by means of a Whitman pump. I killed nearly all the lice and entirely killed every leaf on the tree. How can I get rid of the pests?

ANS.—Paris-green will not kill insects by contact. They must eat it. Aphides or lice suck the juice of plants, and are therefore not hurt by the Paris-green. We have tried it repeatedly. Fresh hellebore (powder or in water) will kill them, but it is expensive. The best thing we know of at present is tobacco tea.

T. H. S., Mannsville, N. Y.—When my calf was two weeks old a hard, slightly movable lump appeared on its jaw, slowly disappeared, but soon returned again. It is now about the size of a butternut. How should it be treated?

ANS.—If the bunch is on the side of the jaw, and movable with the skin, it can best be removed through a vertical incision in the skin, the skin to be stitched together after the operation. If beneath the lower jaw, it is close to important structures and should not be disturbed except by a veterinary surgeon.

W. A. S., Tyre, N. Y.—Mr. Plumb, of the New York Experiment Station, says the Washington Glass Wheat is the same as the Surprise sent out by the RURAL some years ago in its Free Seed Distribution; is it, and where can it be obtained?

ANS.—We think the Surprise (sent out by the R. N.-Y.) is *not* the Glass. We raised this wheat years ago. We are not aware that the Surprise is offered for sale. If any of our readers have it for sale, we will state the fact upon being so advised.

C. E. B., Northville, Tenn.—My six-year-old cow, usually once in about two weeks, has great difficulty in voiding urine. She strains hard, and sometimes takes five minutes in voiding. There is nothing unusual in the color or quantity of the urine. Salt appears to give temporary relief. What ails her?

ANS.—We cannot tell the difficulty from the description. Consult a veterinarian, if possible.

R. L. B., Reform, Mo.—What will make a cow come in heat?

ANS.—Very little, if anything can be given a cow to make her come in heat. The most you can do is to keep her in a good healthy condition—not too fat—and give her time. If, after several months she does not come in heat, she is probably sterile, owing to some disease or abnormal condition.

C. G., Melrose, Kans.—What ails my pigs? They become stiff in the hind ankles and walk with the ankles bent forward, and finally walk on the ankles, with the foot bent back growing worse until they die.

Ans.—Without a knowledge of the post-mortem lesions we are unable to diagnose. The weakness may be due to any one of several causes.

J. H. S., Hickory, W. Va.—1. How are Diehl and Probsteier pronnced? 2. Are the roots of apple trees affected with bitter rot suitable for grafting stock?

Ans.—1. Deel. 2. Probsteer. 3. Nobody can say. It is better to propagate from other stock.

J. D. D., Eldred, Pa.—The grass sent for name is Festuca elatior—Meadow Fescue, Randall Grass, Evergreen Grass. It ripens its seeds early and gives an early bite to cattle. It is one of the chief English meadow grasses and cattle are fond of it either green or as hay.

John W. W.—We do not quite understand the question as to grass roots. Are the roots to be used as sod for other parts, or is it merely desired to rid the place of grass roots. If the latter, nothing but cultivation will do it or the use of expensive liquids such as coal oil, etc.

DISCUSSION.

E. P., GREENE CO., N. Y.—As to the question of spreading manure in Winter or leaving it in piles, I notice, about here, that farmers who leave manure in piles and spread it in Spring, get about half the crop that is obtained where the manure is spread as soon as possible after it is made. The land is certainly more mellow. The soil under manure is always more mellow than that which is uncovered. It is due to the action of the manure on the soil. Very rich soil is seldom hard or lumpy. I claim that the sooner you get the manure out on the land, the more rapidly it will be decomposed, and the more friable the soil will be. Farmers make a great mistake in not saving their liquid manure. I throw my horse manure in the alley behind the cows. It is like a sponge to soak up all the moisture. The cows are clean and dry. They never were before the manure and bedding were thrown behind them. The warmth from the horse manure keeps the heaps from freezing. I can haul in Winter without freezing. The cow manure is so damp that the piles will not burn, and the cut straw makes the manure handle easily. I carry my horse manure several rods in a basket to place it back of the cows, and consider myself well repaid. Farmers waste millions in letting their liquid manure go. Use chemical fertilizers, but save your barnyard manure first. You can save ammonia in liquid manure cheaper than you can buy it. The only way to make farming pay now is to double the crop that can be grown on an acre and thus save labor. Save the manure and make it work for you.

W. F. K., BATON ROUGE, LA.—The RURAL is in error in saying that people here plow with sticks. It is true that our people are a long way behind farmers in some parts of the country, but we are not so far down that we have to plow with sticks. [We said "cultivate" with sticks, meaning that sticks or wooden hoes are used by some of the negroes in place of our lighter hoes.] Our nights are not "sweltering hot." It is rare for us to have a hot night. They are, as a rule, cool and pleasant. This climate is not understood. The thermometer seldom goes above 90°, and then only for a few hours. In this part of the State we have very few mosquitoes, the great pest of the lowlands. Those from France say this section is very similar to that of Bordeaux.

K. S., HILLSBOROUGH, N. H.—R. C., Jr. should clear out his well or dig a new one. If there is enough foul gas in it to spoil milk, the water can hardly be fit to drink. Hot charcoal thrown down the well would absorb the gasses, or if he could force a stream of air through the water his well would be all right.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING July 31, 1886.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, AUGUST 14, 1886.

Johnson Grass, started from seed at the Rural Grounds four years ago, is now (August 3) in bloom.

Profit and beauty are combined in the Japan Chestnut. Why not plant it on the lawn or in the garden as well as the maple, ash, beech, birch or linden?

The strawberry plants of our present collection quickest to recover after fruiting, are Augur's 87, Sharpless, Hilton, Ontario, Bubach No. 5, Ironclad and Belmont.

Some of our ensilage friends ought to try Prickly Comfrey. Horses and cattle do not like it raw, but they might take to it as it comes from the silo. We don't know of any plant that would give more green leaves to the acre. Then, besides, it is a hardy perennial, and, according to chemical analysis, very nutritious.

We wish that this simple fact, abundantly proven by reiterated experiments, were better known and acted upon by farmers. It is that the failure of nitrogenous fertilizers to increase crops is often due to a deficiency of phosphoric acid and potash in the soil; that the failure of phosphoric acid to increase crops is often due to a deficiency of nitrogen and potash in the soil; that the failure of potash to increase crops is often due to a deficiency of phosphoric acid and nitrogen in the soil; that, finally, the failure of any two to increase crops is owing to a lack of the third.

There is no reason in the world why the farmers of New York State should not send their boys to fill up the agricultural department at Cornell. The course is an excellent one, the instructors are all men of note, and the small expense necessary to complete the course renders it possible for any farmer's boy to attend. The terms of admission are easier than ever before, why not send your boy there? You are bound that he shall have an education. Perhaps you were unable to acquire a college education yourself, and for that reason are doubly anxious that your boy shall have every advantage. Do not make any mistake in the matter. Agricultural education is as legitimate and necessary as legal education. True agriculture is the most intricate trade in the world. It requires a broader education, a truer groundwork in science than any other occupation. A boy who loves the farm, who delights in handling stock or in experimenting will not be led away from farming at Cornell. Let him take the course in agriculture and he will make a better farmer to pay for it. If you have a genuine farm boy, friend, don't try to make a lawyer or a doctor out of him, encourage him to make a farmer out of himself, and give him every chance you can of mastering all the details of his profession.

WHEAT SOWING.

During our farm experience of 20 years, every year of which we have raised wheat, we fancy we have learned one or two things; that is for a light or sandy soil, though as a matter of fact a sandy is heavier than a clay soil. One of the things we have learnt is to plow the oat stubble as soon as possible after harvest. Oats in our rotation always precedes wheat and Timothy seeding. Whether farm manure is spread or not, our wheat seems to be benefited by a light dressing of a complete fertilizer just before sowing. The land is then rolled and harrowed. For several years we rolled both before and after seeding, but were convinced that it is not a good thing to do. The rolled surface *bakes* and causes the rain, instead of soaking directly into the soil, to form gutters and to run in little streams here and there. It also appeared that wheat rolled after seeding did not stand the Winters so well, being killed out in places.

Who can rationally advise farmers in general as to the quantity of wheat that had best be sown per acre? We can not. Some wheats tiller little, others a good deal. The amount of seed wheat must be determined accordingly. Is your land light or heavy, well or imperfectly drained; rich or poor? Every farmer must consider these questions for himself and sow accordingly. From careful experiments made years ago, we settled upon 1½ bushel to the acre for either Clawson, Silver Chaff or Fultz.

LAST NOTICE.

TEN DOLLARS

for the largest Bird Cantaloupe from the Seed of the Rural's last Seed Distribution.

TEN DOLLARS

for the largest Watermelon.

TEN DOLLARS

for the longest ear of the Angel of Midnight Corn containing the greatest number of kernels

TEN DOLLARS

for 10 of the heaviest pods from the Alaska Pea.

The prizes will be awarded October 1st. All competitors will be required to *advise* us as to the weight or size of their peas, melon or corn by postal card. *Those who take the prizes may be required* to send the prize-taking articles by express to this office, though at our expense.

EXPERIMENT STATIONS.

The ideal Experiment Station would be a blessing indeed to the farmer. It would be a fountain of knowledge to which he could scarcely apply without receiving benefit. It would be a place to which he might put questions on all subjects connected with agriculture, with the surety of being truthfully and disinterestedly instructed as to all that is known on the subject. Should an unfamiliar, destructive insect appear, the Experiment Station should be able to tell the farmer what it is, and how best to fight it. Does a farmer wish to know the merits of a new grain or fruit, the Experiment Station should be able to give him the result of careful comparative trials. Does he desire to set out a collection of ornamental trees, the Experiment Station should be able to show him samples of all, with the whole truth as to their healthfulness or hardiness; and so on through the whole range of agricultural matters. Not only so, but the Experiment Station report should give him practical information on many subjects of which he had not thought to ask.

But where is the ideal Experiment Station? Let us not despond because it has not yet arrived. We have several young Experiment Stations that are doing all in their power to advance the interests of agriculture. Their motives and efforts are the best that their managers can think of. It is to be regretted that most of them are as yet hampered through want of means. But we hope a brighter day is dawning.

An Experiment Station of all other places requires men of energy and ability, and men who are willing to use these gifts in the pursuit of discovery for the public good. The Director who habitually sits in his office, trusting all responsibility to his subordinates, and writes reports and bulletins of experiments of which he has not seen a single detail performed, and of which he has made no attempt to verify a single figure, proves thereby his unfitness for his position.

An Experiment Station is no place for political, or any kind of dead-beats. Politicians, send your salary suckers anywhere else, but for heaven's sake keep them out of our Experiment Stations. We want nothing but pure gold there.

STORY WRITERS.

In the early part of the year, a prominent paper offered very liberal prizes for stories. The design, in part, was to develop amateur story writers and to encourage youthful aspirants for literary fame. Some 6,000 manuscripts were sent in. The prizes must, of course, be won by a few practiced writers, while the great many amateurs must be doomed to disappointment. It is a question whether this prize-story business does not work serious harm. Many a young man or young woman, without the first qualities of imagination, experience or insight into character needed to make a good story writer, are induced to spend hours of valuable time at hopeless writing. This same time, applied to regular work or systematized study, would bring a thousand times the satisfaction that the hours spent at story writing can ever bring. It is well to be able to express one's thoughts strongly upon paper; practice at letter-writing and description is always desirable. To write a good story, however, requires qualities of mind and heart, experience and careful drill, not possessed by one person in ten thousand. The young men and women who are lured on by these attractive prizes to neglect plain, wholesome work, are doomed to the most hopeless disappointment. They cannot succeed any more than a raw workman can jump into a skilled mechanic's place and hold it. There are hundreds of highly educated men in all our large cities, capable of doing the very best of literary work, who would be utterly unable to support themselves at story writing. The tendency of too much of our educational system is all wrong. Somehow, the graduate of one of our schools gets the idea firmly fixed in his head that manual labor is degrading, and that he must get into some business wherein he can keep his hands clean. The mania for story writing that is sweeping over the country is sure to add to this contempt for manual labor. The healthy young men and women who sit down with the deliberate intention of becoming authors without a willingness to spend years in careful study and observation, are to be pitied. Their days of usefulness are limited. Literature as a recreation is a success; as a business, it means failure for nine out of ten.

THE NATIONAL OLEOMARGARINE LAW.

Last Monday the President signed the Oleomargarine Bill, and sent to Congress a rather lengthy message giving his reasons for doing so, and suggesting several amendments to be made promptly. He does not think the definition given of oleomargarine clear and distinct enough, and he has some doubts as to the constitutionality of sections 14 and 15, as they may be construed as interfering with the police powers of the States. Although if they were found invalid, it would not vitiate the whole measure, yet he urges amendments to remove all doubt in the matter. "There is certainly no industry," he says, "better entitled to the incidental advantages which may follow this legislation than our farming and dairy interests, and none of our people will be less begrudged than our farmers and dairymen. The present depression of their occupation, the hard, steady and often unremunerative toil which such occupation exacts, and the burdens of taxation which our agriculturists necessarily bear, entitle them to every legitimate consideration." True, every word of it; and yet there's a howl from the partisan press that this clear statement of fact is only a bid for the farmers' vote! Well, the more "bids for the farmers' vote," the greater the likelihood that due consideration will be given to the farmers' needs and demands. Both the great parties are bidding quite lively for the soldiers' vote, the Prohibitionists' vote, the labor organizations' vote, and are making large concessions to secure it; why shouldn't they bid still more eagerly for the farmers' vote, which is by far greater than all the others combined? When both parties appreciate more keenly the importance of the farmers' vote, and neither party can feel sure of it, more "bids" will be made for it, and more inducements held out to obtain it.

With regard to the frequent misstatement that the real purpose of this measure is to destroy one industry for the protection and benefit of another, the President says he is convinced that the tax cannot possibly destroy the open and legitimate sale of the product on which it is levied. If the article has all the merits claimed for it, and if the people want it under its real name, the tax will leave a fair profit to manufacturer and dealer. If its existence and profits depend on disposing of it for something else which it deceitfully imitates, "the entire enterprise is," he says, "a fraud, and not an industry; and if it cannot endure the exhibition of its real character which will be effected by the inspection, supervision and stamping which the bill directs, the sooner it is destroyed the better, in the interest of fair dealing."

That is precisely the opinion which the Rural has all along expressed. Hitherto the enormous growth of the oleo business has been secured almost entirely by fraudulent misrepresentation. The manufacturers and dealers have made exorbitant profits by palming off on the public the counterfeit for the genuine. Instead of blustering and whimpering because the new law tries to prevent them from continuing this "sawdust" sort of swindle, they should rejoice that it does not force them to disgorge their dishonest gains, or clap them in prison for their "mercantile knavery."

We do not think this law will be as great a restraint on the bogus butter men or as great a benefit to dairymen as many imagine. The reduction of the tax to two cents a pound; the insertion of a provision in several sections throwing upon the prosecution the burden of proving that the offender "knowingly" violated the law, and the rejection of the provision giving a moiety of fines to informers, have all weakened the force of the bill as originally introduced in the House. We would have commented on these errors at the time, but thought it bad policy to weaken our own side by carping criticisms while they were battling with the enemy. The matter of paramount importance was to secure the passage of a national law regulating the manufacture and sale of oleo products in every State and Territory of the Union, and thus settle once for all the constitutionality of oleo legislation, so far as the question can be settled outside of the Supreme Court. To the amendments suggested by the President such others can be added as experience may prove necessary for the enforcement of the law and the accomplishment of the objects for which it was passed. Moreover, the passage of this national law does not abrogate or in the least weaken the various State "oleo" laws already in force, or in any way prevent the amendment of these or the enactment of new ones. The farmers of the country have shown their dominant influence, when roused to vigorous action, on national legislation; surely they can secure the passage of efficient supplementary laws in their respective States to piece out the shortcomings of this "oleo. law."

BREVITIES.

Wool will probably go higher.

The European apple crop is far below the average.

The dwarf nasturtium is a fine flower for rock-work.

What we want is a *thornless* blackberry as good in quality as the Kittatinny, as hardy as the Taylor or Snyder.

The market gardeners about the Rural Grounds are now getting $1.25 per 100 ears of sweet corn. Eggs bring 2½ cents each at wholesale.

It will be a difficult task for the New York Hort. Society to find another secretary so competent, so energetic and so well beloved as the late James Y. Murkland.

The wet weather continues at the Rural Grounds. Tomatoes rot as they ripen. The ears of green corn were never before so much injured by the corn worm.

Indefinite Quantities.—A barrel of apples, a quart of strawberries, a basket of peaches, a box of cranberries, a box of huckleberries, a quarter's worth of eggs, a dozen eggs.

It seems that a large attendance at the approaching convention of American florists is promised. It will meet in Philadelphia the 18th, ending the 20th. The Colonnade Hotel will be the headquarters of the society.

Some of our neighbors are trying the White Wyandottes. Whatever superiority they may possess over the Spangled Wyandottes does not as yet appear. The variety will, no doubt, become fixed and be admitted to the Standard of Excellence.

We are ready to commend the Mikado Pear as an ornamental tree. It is beautiful in blossom (the blossoms are twice the size of the ordinary pear's) and the pears, so uniform in shape, with their long, slender stems, hang like so many pendent balls. The leaves are large, thick and glossy, and hang on until frost. The fruit is good for canning.

J. M. Ogle, of W. Territory, sent us a root of the Evergreen Blackberry, which seems to thrive so well in his county and to bear such wondrous quantities of fruit. It was received and planted last May. It has made a fine growth, and is really a handsome, ornamental vine. It is bearing a few clusters of berries. This is the European blackberry (R. fruticosus) often called Evergreen, Cut-leaved, Parsley-leaved, etc.

Among the visitors at the Rural Grounds are some who desire to see everything—shrubs, trees, grapes, small fruits, as well as our field experiments. They have lots of questions to ask and are interested listeners. There are others who walk about apparently seeing little and talking much. We sometimes wonder when they go away what they learnt and what they came for.

Our list of fairs this year is the most complete we have ever issued. It will be of service to exhibitors who wish to be represented in all parts of the country. The balance of the list will be printed next week. We shall be glad to have the Rural exhibited at all the fairs named in our list. Those of our friends who wish to talk up the paper at the County Fair will be supplied with posters, samples, etc., upon application.

It has for many years been considered essential that lightning rods should not touch the building they are designed to protect, and where support has been necessary, glass tubes, which have been thought to act as insulators, have been placed within the iron supports driven into the building. It is of late years thought safer to connect the building with the rod. Why not? The lightning rod is a better conductor of electricity than the building, else it would afford no protection whatever, and lightning will not leave a better for a poorer conductor.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

HER GIFT.

THE great Artificer in putting together your individual nature, did not forget this crowning gift any more than He forgets to add its own fragrance to the arbutus, or its own song to the lark.—*F. E. Willard, in "How To Win."*

What was it then for her,—
This matchless thing,
Which nothing should deter
From taking wing?

What power latent still
Lay folded in
The chrysalis of will
To help her win?

No rhythmic melody of thought
Was hers: no speech,
Quick flowing at the moment sought;
Nor could she teach.

No special duty came
To view. Alway
Her work-days were the same,
Day after day.

Then bowing low she prayed:
Lord show me light,
For truly thou hast made
This opened sight.

And since I see, wilt Thou
Grant further gift,
And teach me where and how
Mine eyes to lift?

After long weary years
Of earnest seeking,
She found with quiet tears
Her gift in keeping.

For patience—gift so rare—
Had crowned her days,
And brought her now to share
The winner's praise.

—*The Chautauquan.*

OF INTEREST TO WOMEN.

AN exchange tells us that New York has 8,557 licensed saloons—one to every 23 voters. Philadelphia possesses one for every 20 voters. A pithy argument for more temperance work.

As an agreeable offset to this, we may cite the example of a temperance bar-room in Boston. It is well located, and everything served is of the best quality. There is a lunch counter and a drinking counter. The drinks, soda in every form, lactarts, acid and egg

phosphate, nerve food, beef tea, chicken tea, etc. As a business affair, this place is a grand success.

Lady Harberton and her rational dress is exciting much interest in London. It is proposed to give a bazar or garden party at which all the women are to appear in this attire. But according to the illustrations in the London Queen, apron draperies are so arranged that the divided skirt is entirely hidden. This removes any eccentricity of appearance, but it must also remove the freedom of movement, which is to be the great boon of this new style.

Very practical directions for home nursing were given before the National Health Society in London. We are told that a sick-room should have a south-west aspect and little furniture; a single bed is better than a double one. It is important that the chimney should be clear. In place of fire-irons there should be a wooden poker, the coal wrapped in paper in pound packets, to be put on without noise. Cheerful pictures on the wall, often changed. Oil-painted walls are better than paper of distracting patterns. A fire is the best ventilator, for the foul air when cooled falls to the floor, and passes out through the fire-place. Doors are made to shut, windows to open: air without draught is what is needed. The room should be kept clean by dusting with a damp cloth, rubbing the floors in the same way: the less carpet the better. Fresh flowers are not deleterious. Visitors should sit between the door and the patient, getting the benefit of the air, and not between him and the fire, thus getting in the direct current of foul air rushing towards the fire-place; they should be well in sight of the patient, and never admitted at meal times. Amateur nurses should not show over-anxiety or hover continually over the patient, asking what they will take, or wear creaking boots or rustling silks, or be bustling or fussy, nor stealthy nor cat-like, and whispering should be mercilessly tabooed. A nurse should be of all things, cheerful, compassionate, kind, but never sentimental Decision and firmness are needed. Medicine must be given with the regularity of clock-work. A sick-room should be kept tidy; plates, cups, etc., that have been used should be turned out at once. In case of faintness, where stimulants are not ordered, the patient should be made to sip some liquid slowly; the mere effort of sipping accelerates the action of the heart. A reaction is setting in against beef tea; to make it veritably nutritious, it should be mixed with Dr. Ridge's or some other farinaceous food. Milk is the most nutritive of all such diets. The several symptoms should be written down by the nurse from time to time on a slip of paper, always at hand, for the doctor. In infectious disorders, nothing should be kept in the room except for use. Clothes in a wardrobe under such circumstances have been known to spread infection ten years after. A sheet should be kept suspended outside the door always wet, by keeping one end dipped in carbolic or Sanitas Handkerchiefs should be replaced by rags, burnt when used. Letters from the patient should be baked, or written on post-cards dipped in carbolic; they are capable of spreading disease otherwise.

DRESS AS AN ART.

UNDOUBTEDLY it is the greatest mistake in the world for any girl to regard dress as her sole end and aim in life. It begets a host of frivolous cares, none the less galling in that they are really absurd, and pitches one's life and purpose in a trifling key. But too great a carelessness in this matter is equally to be deprecated. Outward appearances have much to do with first impressions, and a woman with the wisdom of Portia and wit of Rosalind would be the reverse of attractive if she displayed a crumpled collar and ill-fitting gown, composed of colors that "swear," as the French say.

"Costly thy habit as thy purse can buy," says the worldly-wise Polonius, and he continues with unimpeachable advice on style. There is nothing where the fitness of which our recent correspondent writes can be more fully regarded or ignored than in this matter of dress. Not only fitness for social condition, but personal appearance and peculiarities. Really, it is rarely that any two persons can dress alike becomingly, unless some very unostentatious style and color is chosen; color and fit are the two prime requisites in a becoming gown. This matter of color is always trying, in more senses than one, unless one is born with an artistic sense of harmony—which, alas! is not the good fortune of all. Thrice blessed is the woman whose eye instantly sees the harmony of color; who can always pick out the correct hues for every combination.

To make dress truly an art, we must take into account all the personality of the wearer. Thus, a young girl should wear simply made frocks of some unostentatious material. During the Summer she should confine herself as much as possible to thin light-colored fabrics; in the Winter, soft woolens; if she desires silk, it should be soft surah, or else India silk. I am sorry to say a great many country girls look upon a stiff black silk gown, cracking with jet, as the hight of their ambition in dress. A plain black silk is a very useful gown, and often has a sort of demure dressiness about it—don't you remember Polly?—Miss Alcott's "Old Fashioned Girl," with her best black silk—but there are plenty of other things, more suitable for a girl. An older woman who has lost her youthful bloom, may wear richer fabrics, of dark and undecided colors.

We must always take figure into account. A large person, inclining to corpulence, must use light colors very sparingly, and carefully avoid straggling figures, large plaids, or bayadere stripes. Perpendicular stripes, if not too large, will appear to lessen the bulk of the wearer. Consequently, a thin woman must avoid these stripes, which would make her appear like unto a gridiron. Velvets and brocades may be recommended to slender women: silks and satins to their plumper sisters. But excessively stout women must not wear very shiny fabrics; stuffs which absorb rather than reflect the light should be chosen. Similarly, short or stout women must avoid fussiness in trimming. Conspicuous ruffles or fichus must not be worn on the street. A plain ruche or linen collar only is admissible. Some women cannot wear the stiff collar: the ruche is allowable with them. In colors, one sober hue may be chosen for the gown, lightened by some little touch of brilliant color, as a sort of key-note.

Brown is a color universally becoming to blonde or brunette, but dirty-looking, undecided brown should never be chosen. Light colors increase the wearer's color; darker ones reduce it. Thus a pale blonde may wear light blue or green, but navy or myrtle would give a sallow tint. Pale brunettes must wear very light or very dark colors. Ruddy brunettes may wear decided tints—no neutrals. White is very becoming, and so is clear yellow. If not natural, the sense of harmony in color may be acquired, and since the art of dress is incomplete without it, it is one of the necessary trifles in a woman's education.

GOLDEN GRAINS.

CHEERFULNESS makes the mind clearer, gives tone to thought and adds grace and beauty to the countenance.....

GEORGE ELLIOT says: "Failure, after long perseverance, is much grander than never having a striving good enough to be called a failure".....

HE who shows the most loving nature toward everybody, is almost always the man who has gained the power of loving all by loving one as if there were none other to love..... .....

KINGSLEY says: "As the rays come from the sun, and yet are not the sun, even so our love and pity, though they are not God, but merely a poor, meek image and reflection of Him, yet from Him alone they come. If there is mercy in our hearts, it comes from the fountain of mercy. If there is the light of love in us, it is the ray from the full sun of love".....

ISN'T there too much truth in the statement of an exchange which says: "Our church festival is over. The treasury has $53.19 net gain—that is the credit side. The debit shows an appalling list of misunderstandings; several cases of dyspepsia, aggravated by late suppers, eaten on the supposition that church suppers are not injurious; a thin attendance at prayer meeting the evening following; a spirit of exultation because we cleared $1.79 more than our Baptist neighbors; a spirit of bitterness because some one said their singing was better than ours".. ....

RELIGION which does not restrain evil tendencies and produce a sober life, which does not lead a man to love and practice justice and mercy, which does not teach and preach supreme love and service to God, is a form of godliness without its power, a garment which hides a skeleton, a useless machine.....

IT is said the doorways of some of the Oriental Churches are not more than three feet high, to teach men that they should humiliate themselves by entering into the house of God upon their knees.....

IT is only those who have character and principle themselves that are qualified to praise character in others. What does it avail for a deceitful man to praise truthfulness in another, for a mean man to commend another's liberality, for a swindler to shower plaudits on one who is the soul of honor. If any one should give praise worth having he must know of what he speaks ....

THE N. Y. Journal of Commerce says: there is no royal road from want to possession. Whatever the desired acquisition may be, if it is worth having, it can only be gained by long and wearisome toil..... .....

As whole acres of Persian roses are required to make one priceless ounce of the pure attar, so the soul's balm is the slow product of a long course of right living and thinking, every separate thought and act contributing its own minute but precious particles of sweetness to the rich result.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOW PHILADELPHIANS COOK.

MARY-WAGER FISHER.

A FEW years ago, if my memory serves me aright, I gave a short description in this column of the RURAL, of the Cooking School in Philadelphia so ably conducted by Mrs. Rorer, who has also for several years demonstrated the fine art of cookery to aristocratic classes of young ladies in the Seminary at Agoutz, near Philadelphia, as well as elsewhere. The charming deftness and clearness, the economy and healthfulness of her methods, and the deliciousness of her products raised in the minds of all persons familiar with her work the persistent query, "Why do you not embody in book form, for the benefit of everybody, the delightful knowledge you have of domestic economy?" The suggestion, in course of time, took root, and within the last few months has blossomed forth in the shape of a handsome volume of 600 pages, bound in oil-cloth, and bearing the title "Philadelphia Cook Book." At the bottom of the paper in which the book comes covered, is this legend: "If the wrapper should stick to the oil-cloth it can be removed with a damp cloth"—a sentence that in a way illustrates one very important feature of the contents—you are told how to proceed in case of emergencies, as well as under ordinary circumstances. In referring to this book, it may not be amiss to say that Mrs. Rorer has more than justified the high expectations of her friends, for the book is capital from cover to cover, and as interesting in its way as Webster's Dictionary, which is one of the most interesting books of which I know. It is written in a very terse, captivating style, and will do more than any other cook book that I know of, to dignify and make attractive the noble art of gastronomy, while at the same time it is thoroughly practical in every detail, and not only inculcates economy, but teaches us how to utilize everything to the smallest scrap, besides being an invaluable encyclopædia for "family use."

I don't know that every housekeeper enjoys a good cook-book so much as I do, but the mere reading of a toothsome recipe gives me almost as much pleasure as does participating in the dish when prepared. If all women could cook as does Mrs. Rorer—making hardly a mark of her occupation on her dress or in her cook-room, a lady among pots and pans, in spotless array, everything moving and harmonizing like clock-work, and odors escaping from oven and stew-pan, that make one's "mouth water" to think of, even—why, then it would be easy to imagine all women accomplished cooks. As it is, with schools for cookery and lectures on cookery (not always good and practical, as they should be), it has become fashionable among aristocratic young women to learn how to cook. And still it is surprising that among so many intelligent women looking about for means of earning a livelihood, so few turn their attention to the preparation of food. One young woman in a town in New Jersey not only supports herself, but is amassing a snug little competence in making and selling sponge-cake, and her orders are always larger than she can fill. A few women in the United States put up fruit in various ways, and make pickles that are always in demand. The pretty story that went the rounds of the newspapers a few years ago, of the New York lady reduced from riches to poverty, who supported herself in great comfort by taking charge of fine dinners in the houses of people where she was once a guest, is worth repeating. She knew how, to the last detail, to have the dishes served, to arrange the table, and what instructions to give the waiters, if any were needed, so that the givers of the dinners were relieved from all care and anxiety in the matter. But in how many neighborhoods or towns is there a woman to be had, in case of need, with sufficient intelligence, discretion and training to prepare and serve an elegant dinner, breakfast or luncheon economically and tastefully?

The wholesome preparation of food is one of such vast importance that it is a little curious that it has been left so long in the hands of ignorant hirelings. It is unquestionably true that a bright and intelligent woman can quickly become an accomplished cook; but intelligence and perception are absolutely required. Some of the best cooking in the country is that of the wives of farmers, and some of it is of the worst! I have often heard Anaximander say that he never enjoyed his meals more than in a cabin in Western Pennsylvania where the mother of twelve children did her own work and the cooking, without the help of a housemaid. Of course, there were no accessories of fine china and table linen or "style"—and the food was rated according to its unadorned merits. Everything was done to a turn and seasoned deliciously. Such food makes strong bodies, and strong bodies go a long way in producing and upholding strong minds.

HINTS FOR THE HOUSEWIFE.

TORTOISE shells, or those of the small fresh-water turtle, some of which are very beautiful, are becoming quite fashionable as parlor ornaments. To clean and polish the shells, first wash them in warm, soft water, to which a little ammonia has been added, using a common hand-brush. When clean, rub them with a cloth and paste made of whiting and a little water. When the shells feel smooth to the touch, wash this paste all off and dry, after which apply a few drops of sweet oil and rub them briskly with the ball of the thumb or the palm of the hand—or a piece of soft leather will answer.

It is generally recommended to clean sad-irons by rubbing them over a paper on which fine salt has been sprinkled. This cleans them very well, but it renders them very liable to rust on exposure to the least dampness or even to damp air. A much better way to "smooth" them is with emery. Purchase a few cents' worth of the flour of emery—about No. 120. It can be obtained at the hardware stores at about 20 cents per pound. Take a piece of softish pasteboard—an old box cover will do—a foot square, more or less. Moisten it with glycerine or oil, and sprinkle on the emery quite thickly. When the iron is rough, rub it over this, laid on a table or bench, for a few moments. Then finish by rubbing its face with a piece of cloth, in which is tied a small piece of bees-wax or paraffine. This will give the finest polish imaginable, and the iron will not rust again with any fair treatment.

Now, in the fruit-canning season, the women of the household, to whom we are so deeply indebted for the good things we eat, should be told that the trouble so many of them take in warming glass cans before putting hot fruit into them, to prevent breaking, is all needless; that, in fact, it results in breaking more than it saves. By placing the cold can on a *wet* cloth taken from a dish of cold water, it may be filled with fruit boiling-hot without the least danger of breakage. The only requisite is, that the cloth be fully saturated—and with cold water. This is by no means new; but still, there are thousands who either have not heard of it, or have not faith enough to try it. I know it to be a safe way.

The rubber rings by the use of which fruit cans are made air-tight, after being used, become hard and unyielding, so much so that fruit seldom keeps as well when they are used the second time. Though new ones cost but little, it is not always convenient to get them. Every one should know that the elasticity of the old ones can be restored, and that they can be made as good as new by soaking them a half-hour in a mixture of ammonia and water — two-thirds ammonia and one-third water. Try it.

During the hot weather the less meat we eat the better for all of us. The reverse is true in regard to fruits. With the ease and little expenditure of time and muscle with which they can be grown, there is no excuse for any farmer who does not provide a bountiful supply for his table at all times. UNCLE J.

KITCHEN TALKS.

ANNIE L. JACK.

THE old labels on shrubs and plants are fast fading, and likely to cause confusion if not renewed. So the Florist of the family painted some sticks with white lead, and wrote the names while yet the paint was wet, and they are said to endure all sorts of weather. To etch a name on steel tools, is best done by spreading a thin coat of bees-wax over the place where the name is to be written, and then with a sharp-pointed needle write through it. This is then to be painted over with nitric and muriatic acids in the proportion of six to one, and when bubbles cease to rise, the writing is fixed. Wash afterward in strong soap-suds, and it will keep the name upon it to the great inconvenience of any borrower or thief, and both classes of people are found to be inconvenient at times.

A neighbor suffering from a severe burn found relief by an instant application of the

yelk of egg and glycerine in equal parts. It formed a kind of varnish to keep out the air, and the burn healed underneath.

Everyone is lamenting that we had rain on St. Swithin's Day, but though a good deal of hay is cut, we have faith that the superstition will not prove true. It is strange to read of the different phases of weather in different places, and we are content to have a little rain, when we read of a 14 month's drought in Texas. I spoke, in my last "Talk," of drinking water, and since then we have sent the water from our own well to be analyzed. It was quite a comfort to find by the report of the analytical chemist that "the sample of water is a thoroughly safe one—and remarkably free from organic matter." I did not expect it to appear so well, and was agreeably surprised. From such authority this was highly gratifying, and I mention it that others may be induced by the same method to learn if impurities exist—a knowledge that may be of great value to them in reference to health.

The cook, who is an amateur, as all RURAL readers know, has a serious grievance this hot weather. It is that the supply of light wood has run short and she has to stand over the stove with the heat of the hard wood in it. Besides being a waste as regards domestic economy, it is a waste of strength, and is just as if the men folks wore their overcoats in bringing in the harvest. As a consequence, we have tried to utilize the fire as much as possible when a large fire is on, and to save when possible. Tapioca, sago or corn starch can be made for two days, using it cold after being in a mould, on the days one has cold meat. It is a good thing to contrive in this way, and on very hot days the tea can be made at noon and set away on the ice for tea-time, when with fruit and other delicacies one can get along without lighting a fire except to wash up the dishes later in the evening. Preserves are made up before breakfast; it is by far the most satisfactory method, and the fruit can be prepared over-night, and all be out of the way early if breakfast is not needed at a very early hour.

INDOOR DECORATIONS.

UP to half a century ago, antique furniture in England was relegated to the storehouses and garrets, and even now the houses of the peasantry contain some fine specimens, while at the present day the rage for old furniture is so great that manufacturers are engaged in making *old new* furniture.

Very pretty and convenient parlor screens are so made as to slide downward, and so almost disappear from view.

Portraits and engravings are picturesquely draped with India silk with deep fringes.

If the prospect from a window is not good, a little pale amber and very faint blue or green stained glass can be made to fit into a neat frame, and so arranged as to cover over the other glass. OBSERVER.

BOOTS.

OLD, new, big, little, fine, coarse, dry-weather boots and rubbers—what *shall* we do with them? Unfit to go in my lady's chamber or the closet off it, not handy up-stairs and untidy in the kitchen, where can we put them out of the way? If they are very old, unwearable and nobody wants their legs, then the cook-stove is a good place, for they are excellent to make the pot boil. We've tried a box in the wood-shed, but when wanted, those wanted were always in the bottom, and *he* never stopped to put back those not wanted. A long shelf in the cellar-way was voted too damp, and now we are in despair. If any one has a plan or an "Aladdin's Lamp" that will cause them to appear and disappear at will, I would like to try it. If I ever plan a farm-house, I shall begin with a bath-room and a room for old boots, and both shall be light, well ventilated and convenient.

MARY MANN.

FRUIT PIES THAT WILL NOT RUN OVER OR "SOAK" THE CRUST.

ONE cup of butter-milk, one even teaspoonful of salt, one of soda dissolved in a little water. Stir in one cupful of flour, then add one cupful of fresh suet, melted and hot. Beat well together, then stir in quickly enough more flour to make the dough of the right consistency to roll out. This will make the under crusts for four or five pies. Roll thin. For the upper crusts, rub together one-half cup of lard or butter, and two cups of flour with a little salt; add enough cold water to make the dough right to roll nicely. Roll it all out on the board, spread all over with butter the size of a hen's egg, roll it up into a bundle and lay it on one side until you are ready to use it. Your fruit is, of course, looked over and ready. A large pie, of pie-plant, strawberries, cherries or plums, requires a cupful of sugar; raspberries and blackberries, one-half cup. To each cup of sugar add a heaping tablespoonful of flour; mix thoroughly; then stir thoroughly into the fruit before putting it into the crust. Wet the edge of the lower crust, cover with the upper, which you must handle as little as possible when rolling, if you wish it to be flakey, and bake in a moderate oven. If too hot, the pies will run over, and if too cool, the under crust will not be done.

For pie plant and apple pies I prepare the sugar the same way, but sprinkle it on after the fruit is laid ready for the upper crust. Apples at this season of the year require a cupful of sugar and one tablespoonful of water to each pie; later, less sugar and more water until March, when one cupful of sugar will sweeten three pies nicely. Use about four spoonfuls of water to each pie.

Elderberries mixed with cherries, plums, or cranberries are nice; some like a little cinnamon on them. We like elderberries so well that I can a good many in the season; sometimes with, sometimes without sugar. They keep well either way. The essentials for keeping fruit are, put it up well, then keep in a dark, dry place. I keep mine in a cupboard near the floor, against an inside wall, in a room where there is a coal fire in Winter, and never have any work or mould unless the rubbers are defective. It is economy to replace with new rubbers as soon as the old ones become cracked or hardened.

To return to pies: Apple pies can be flavored with anything you wish; some think a little butter improves them. When using butter or lard for cooking, never *melt*, but simply soften it enough to handle easily.

I keep in my cupboard a little paper bag containing strips an inch wide of fine white cotton cloth (old, of course), which I wet and place around the edge of pies if by any mischance they do begin to run over a little; some cooks always put them around their pies, but I use them very little, as they injure the appearance of a pie somewhat.

If butter is used instead of lard for the upper crusts, pies made in this way are as digestible as puddings, and dyspeptic lovers of pie may eat with impunity. MATER DOMI.

CAKES.

FOR a cake that is wanted for immediate consumption, pine-apple cake is a desirable delicacy. Beat one cup of butter to a cream, with two of sugar; add five beaten eggs and half a cup of milk. Sift two teaspoonfuls of any kind of baking powder through three-and-a-half cups of flour, and add to the eggs, sugar and butter. Bake in jelly tins. Grate a pine-apple, using a coarse grater; pour off the juice; add a cupful of dessicated cocoanut; sweeten with powdered sugar and spread between the layers of cake. Cover the top layer with a plain icing, and sprinkle thickly with dessicated cocoanut.

Orange cake is also nice. Beat together two cups of sugar and the yelks of five eggs; add the whipped whites of three, one-half cup of water, the juice and grated rind of an orange, and two cups of flour through which two small teaspoonfuls of baking powder have been sifted. Bake in three tins, and spread between the layers a frosting made of the whipped whites of two eggs, two teacupfuls of fine white sugar and the grated peal and juice of an orange. Ice the cakes as soon as they come from the oven.

Pound cake should not be attempted by an amateur. Beat to a cream one pound of sugar and one of butter; add the whites and yelks of ten eggs beaten separately; one pound of sifted flour (this should be stirred in alternately with the whipped whites); a gill of brandy, eight ounces of chopped almonds, and four ounces each of candied lemon and orange peel shredded. Beat all well together; seed a pound of raisins, wash and dry three pounds of currants; dredge both with flour and stir into the batter. Line a large cake pan with buttered tissue paper and bake in a moderate oven for at least two hours. The excellence or at least much of it will depend upon the baking. Cover with a buttered paper to prevent its browning too rapidly.

An excellent Sally Lunn is made by beating together four eggs with a quarter of a pound of butter; add a little salt, one cup of yeast or one small yeast cake dissolved in a cup of luke-warm water. Mix immediately after breakfast to a batter as stiff as can easily be stirred with a spoon, pour it at once into the pans in which it is to be baked. Let it rise ten hours, and bake. PALMETTO.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by all Druggists and Perfumers.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans, by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

HIRES' IMPROVED ROOT BEER. Packages, 25 cts. Makes 5 gallons of a delicious, sparkling and wholesome beverage. Sold by all druggists, or sent by mail on receipt of 25 cents. C. E. HIRES, 48 N. Delaware Ave., Philadelphia, Pa.

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.
E. E. BREWSTER, Holly, Mich.

DO YOU WANT A DOG?

DOG BUYERS' GUIDE. Colored plates, 100 engravings of different breeds, prices they are worth, and where to buy them. Mailed for 15 Cents.
ASSOCIATED FANCIERS, 237 S. Eighth St. Philadelphia, Pa.

SCOTCH COLLIE PUPS. No. 1 Stock. Free circular of leading varieties, Fowls, including Turkeys, Ducks, Guineas, Bantams, etc. Address, with stamp, C. C. PAINE, EAST BETHEL, VT.

HUMPHREYS' Homeopathic Veterinary Specifics for HORSES, CATTLE, SHEEP, DOGS, HOGS, POULTRY. Used by U. S. Government. Chart on Rollers, and Book Sent Free.
Humphreys' Med. Co., 109 Fulton St., N. Y.

HUMPHREYS' HOMEOPATHIC SPECIFIC No. 28

In use 30 years. The only successful remedy for **Nervous Debility, Vital Weakness,** and Prostration, from over-work or other causes. $1 per vial, or 5 vials and large vial powder, for $5. SOLD BY DRUGGISTS, or sent postpaid on receipt of price.—Humphreys' Medicine Co., 109 Fulton St., N. Y.

PURE MILK.

WARREN MILK BOTTLES
Patented March 23d, 1880.
Adapted for the Delivery of Milk in all Cities and Towns.
A Long Needed Want at last Supplied.
DESCRIPTIVE CIRCULARS ON APPLICATION.
A. V. WHITEMAN, R. N.,
72 Murray Street, NEW YORK.

"Taking the Lowest Estimate, of five bushels increase per acre, with one dollar's worth of extra pulverization of the soil, or four dollars above cost, the great benefit conferred on farmers by a general introduction of the 'ACME' Pulverizing Harrow becomes obvious If the five hundred million bushels of grain raised annually in the United States, on forty million acres of land could be so easily increased but three bushels per acre above cost, it would add more than a hundred million bushels of wheat to the product of the Union above actual expense. By assisting in the wider introduction of this efficient implement, enterprising farmers and citizens would promote the substantial interests of the whole country." See advertisement on page 540.

HAND PICKED SEED. DIEHL-MEDITERRANEAN.
The hardiest, best yielding and milling Wheat grown. Seed hand-picked and strictly pure. For sample heads and prices, address, with stamp,

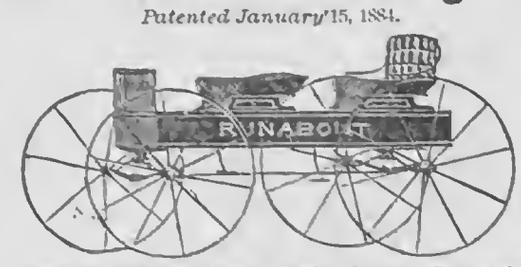
WHITMAN'S NEW PATENT REBOUND PLUNGER PERPETUAL
GUARANTEED SUPERIOR to any LEVER PRESS NOW MADE.

Received First Premium at N. Y. State Fair, in 1880, 1881, 1882, 1883 and 1885, including the Grand Gold Medal and two Silver Medals, over Dederick and others; also World's Fair at New Orleans, and California State Fair. The most rapid, powerful and durable press made; puts over ten tons in car; bale every three minutes; fully warranted and protected; three bales to any other press's two. Send for illustrated circulars. Also Horse Powers, Cider Mills, Corn Shellers, Feed Cutters, &c.
WHITMAN AGRIC'L CO., St. Louis, Mo.

7,000 CHALLENGE WIND MILLS.

IN USE IN EVERY State and Territory of the U. S. It is a sectional wheel, has been made by us 15 years, and has never blown down without tower to skim, a record no other mill can show. MILLS SENT ON 30 DAYS TEST TRIAL. BEST FEED MILLS, CORN SHELLERS, ETC. GOOD AGENTS WANTED in all unassigned territory. Catalogues free. CHALLENGE WIND MILL AND FEED MILL CO., Batavia, Kane Co., Ill.

The Runabout Wagon.
Patented January 15, 1884.



Twelve different styles. *Light, Strong, Convenient* and *Low-priced.* The popularity of the RUNABOUT is such that its sale exceeds that of all other vehicles of its class combined.
Send for illustrated Catalogue and price list direct to the manufacturer. ORVILLE H. SHORT, Syracuse, N. Y.

SPAIN'S CHURNS. Star Churns, Rapid Ice Cream Freezers, Improved Tree Tubs, all made of CEDAR. Send for illustrated circular and prices. Clement & Dunbar, Philadelphia, Pa.

News of the Week.

HOME NEWS.

SATURDAY, August 7, 1886.

THE first session of the 49th Congress came to an end Thursday. Outside of the regular appropriation bills, it passed only two conspicuous laws. One is the Oleomargarine Act, the other provides that in case of the death of both the President and Vice-President the succession shall be from the Cabinet. The session began Monday, Dec. 7, 1885, and covered seven months and 28 days. Of this time the Senate was in session 164 and the House 168 days. There were introduced in the House 10,014 bills and 214 joint resolutions, and in the Senate 2,891 bills and 83 joint resolutions, or a total of 12,202. Most of them were private and local bills. The total number of measures that passed both Houses was 1,101, being 241 Senate bills and 860 bills which originated in the House. Of these 1,095 were received by the President, and of that number 814 were approved: 157 became laws without the President's signature; 115 were vetoed, and nine failed for want of signature at time of adjournment, 10 days not having expired since they reached the President. Of the new laws 746 were House measures and 241 Senate measures. The laws that became such by limitation were, with two exceptions, private pension and relief bills.....
....Of the measures vetoed by the President, 36 were Senate bills and 77 House bills. Twenty-eight of the Senate bills vetoed were private pension bills. Of the 77 House bills disapproved by the President, 74 were private pension bills. The number of measures vetoed during the session was four times more than have been vetoed from the foundation of the Government to the beginning of the session just closed. While nearly all of the vetoed bills of the Senate were reported back from committees with the recommendation that they pass notwithstanding the President's objection, and, while similar action was taken on some of the House bills, only one (that granting a pension to Joseph Remiser) was passed by the two Houses over the veto..... .....
Samuel J. Tilden died at Greystone, Yonkers, near this city, last Monday. Born Feb. 9, 1814; entered Yale 1832: left there after two years on account of poor health, and graduated from the University of New York; admitted to the bar in 1841; founded the Morning News here in 1844; elected to the N. Y. Assembly in 1846; was defeated for Attorney-General in 1855; was Member of the Constitutional Convention in 1867. Had little to do with politics for 30 years, but was very successful as a lawyer, especially in business connected with mines and railroads. Was a strong union Democrat, and was often consulted by Lincoln. Became known to the whole country by his action in exposing the great Tweed frauds in 1868. Was chosen Governor of N. Y. State in 1874 by 53,000 plurality, and gave such satisfaction that he was nominated for the Presidency by the Democratic Convention at St. Louis, June 28, 1876. Had the electoral votes necessary for his election, but the Southern carpet-bag returning-boards cut them down to a minority, and the Electoral Commission at Washington refused to go behind the returns. Never again appeared in public life, except to decline the Presidential nomination in 1880, and again in 1884, and to support the claims for sea-coast defences in 1885 and again this year. Never married; a luxurious but nearly hopeless invalid for nearly 10 years. Left behind $8,000,000 to $10,000,000..... ...
....A call went out, Thursday, from Indianapolis, Ind., for a national convention in that city, on September 1, of Knights of Labor, Grangers, National Greenbackers, Farmers' Alliances, Anti-Monopolists, the Wheels, (a Texas organization,) and all other associations which may harmonize outside of the old political parties. According to the present programme delegates from these orders will meet to organize a new political party, with the rights of labor as the chief cornerstone. The new party is to take the field as a political power, will provide for the nomination of national and State tickets, and will call upon its followers to cut loose from all old affiliations.
.....Reports of Asiatic cholera in Madison, Chippewa Falls and Miladore, Wis., eight deaths at the last. State Board of Health doubt reports; but good local physicians have no doubt.....The Chicago Anarchists have been proving during the week that they were innocent or absent during the riot, and that the cowardly police were the aggressors. Case still on.....Labor organizations going into politics everywhere. .....Snow fell heavily for a short time at Rome and Kingston, N. Y., on August 3.....The Morrison surplus resolution failed to become a law because Congress adjourned before the President had taken action on it. Will come up again when Congress meets in December.....
Chicago being in need of more money, the Commissioners of Cook County, including Chicago, have ordered the assessors to increase the value of the city and outlying towns in the country by just $100,000,000. The assessment now is notoriously too low, and with the addition, the valuation will still be under the reality; but the property owners grumble....
....Congress has appropriated $55,000 for the relief of the Chippewa Indians of Leech and Winnibigoshish Lakes, Minn., who were driven to great straits by the overflow of their reservation by the back-water from the dams built by the Government on the tributaries of the Upper Mississippi half-a-dozen years ago, to form reservoirs for regulating the flow of the river in wet and dry seasons. Five years ago, another appropriation of $15,000 was made as compensation in full when the damage was first done.....The Dominion Government has paid $50,000 for John Roach's steam yacht, Yosemite, which cost twice that sum She can steam 17 miles an hour, and is to be used to look after the Yankee fishing vessels..
.....The Canadians want a reciprocity treaty with us very badly, and are pretty sure they can force us to make one by the restrictions on fishing. It has been a very bad season for our fishermen, and our Northern friends chuckle at the success of their efforts to make it so, and will henceforth try their best to make it still worse. The "Down Easters" are mad at the Government's delay in enforcing the retaliatory measures against Canadian vessels in our ports, which Congress authorized the President to employ at his discretion. No Canadian vessel can now take freight from one of our ports to another, but Canadian freight cars come on our roads to New York, Boston, Portland and other American cities, and load with freight for St. Louis, Chicago and other Western markets, passing through Canada *en route*. An agitation is now under way to stop this practice, which puts millions every year into Canadian pockets. The Dominion Government owns about $200,000,000 in Canadian railroad property, and is, it is urged, making a profit on American land traffic while hampering American water trade.....That huge Nova Scotia timber raft has been hopelessly grounded while being launched.....Monday the House passed the Senate Bill increasing by from 20 to 25 per cent. the pensions of veterans wounded on the arm, hand, leg or foot—consequent annual increase in pension list, $615,204.....
....The Cherokees are bitterly disappointed because they number 18,318 full-bloods instead of less than 18,000 as expected. Hence their $300,000 grass rent gives them only $15.95 a head instead of $16.50 on which they relied. The increase of over 300 in their numbers is a sorry offset to a decrease of 55 cents a piece in their receipts.....
.....So great has been the fall in the price of silver of late that one-eighth of its value has been lost within the past 12 months. A lump of silver bought for $100 a year ago, would now be worth only $87.50. About 50,000 people are dependent on silver mining in Montana and owing to the recent depreciation of the value of the metal, it is feared the mining companies will have to close down.....
....Sunday last, Mrs. Cleveland was admitted to membership of the First Presbyterian Church, Washington, D. C., Dr. Sutherland, pastor.... .....A "Pet" hotel has been opened here on Broadway, and is now full to overflowing. Canaries are charged 25 cents a week, parrots 50 cents, monkeys 75 cents, cats $2.50, dogs from $2 to $5.50. The owners are mostly in the country or at watering places...
.....The Attorney-General of Newfoundland has sent word to Mr. Foster, the Canadian Minister of Marine and Fisheries at Ottawa, that his government will co-operate in measures for the protection of the coast fisheries; so they have given warning to all foreign or American vessels seeking bait and supplies. This, they think, will bring matters to a head at once.....The Grand Army and Army of the Potomac are having a grand time at their re-union in California.....
....The trouble with Mexico has been aggravated by the brutal murder of an alleged horse-thief named Rasures by the Chief of police, at Piedras Negras, Mexico. He had been surrendered by the Texas authorities, although he is said to be a naturalized citizen, and the Chief of police, a personal enemy of his, had him shot without trial shortly after reaching the Mexican side of the Rio Grande.
....Editor Cutting is still in prison. He has been convicted of contempt of court and will receive a heavy sentence, and be at once pardoned by Pres. Diaz. In Mexico, the President can pardon a person convicted of any offense in any of the States, but he cannot interfere with the course of justice until conviction. Texas is very belligerent, and Governor Ireland has officially called the attention of the Government to the trouble. The Cutting affair has also caused a spirited debate in Congress. In Texas troops are being enrolled here and there for the "war." The general impression is that the matter will be settled peaceably, as the Mexican Government is disposed to do what is right, although there is much bellicose vaporing among some of the greasers, especially along the Rio Grande.....
....The reports of starvation on the Coast of Labrador are now declared to be absolute fabrications.. .....

FOREIGN NEWS.

SATURDAY, August 7, 1886.

THE British Parliament opened on Thursday—the day our Congress closed. The Conservatives occupied the Treasury benches; the Liberals took the benches opposite and facing them—always held by the Opposition or the party out of office. The Hartington and Chamberlain Liberal-Unionists sat with the Gladstonians, and Gladstone shook hands cordially with both the leaders. It is thought the Liberals will all act together, except on the Home Rule question, and when the Conservatives are in danger of defeat on that matter, the Unionists will quit the House in a body, leaving the Conservatives in a majority over the Gladstonians and Parnellites. The latter will try to force the Ministry to declare their policy towards Ireland; but the Conservatives will endeavor to get supplies voted, and then adjourn till February, in hopes that something may turn up meanwhile.....
....The Earl of Aberdeen, late Lord Lieutenant of Ireland, and his wife won tremendous popularity by their courtesy, liberality and hearty concurrence in Gladstone's policy. The greatest demonstration since O'Connell's time occurred in Dublin to bid them good-bye the other day. Delegations from all parts of Ireland. Intense enthusiasm. The Marquis of Londonderry, the new Lord Lieutenant, is the grand-nephew and heir of Lord Castlereagh, who brought about the union of Ireland with England in 1801 by the most outrageous bribery, treachery and intimidation. He has been the worst-hated wretch Ireland ever produced, and fittingly ended his life by suicide. His grand-nephew, though a good enough fellow personally, is unpopular owing to his relationship.....
Elections held in France early in the week for General Councils (local bodies who will elect the next batch of Senators) were decidedly in favor of the Republicans, in spite of the combined efforts of the Monarchists and Imperialists The results are as follows: Republicans elected, 768: Royalists elected, 366; second elections required, 150. It is estimated that when all the returns are in there will be, of the 1,432 Councilors to be chosen, about 1,000 Republicans, a number equal to that returned in the departmental elections in 1883, so that the Republicans will have a majority of 79 in the Councils.....
....Minister of war Boulanger has got himself into very hot water. In the discussion about the Duc d' Aumale's letter to President Grévy, Boulanger charged the Duc with impertinence. A monarchist retorted that it was the Duc who had made him a General, as he was a Colonel on his staff in 1880. This Boulanger denied in the Chamber of Deputies, and again in three Republican papers. A letter of the newly fledged General to the Duc, dated in 1880, has been produced in which he said, "Monsigneur, it is to you that I owe my appointment to the rank of General. Happy will be the day which shall place me again under your orders." Boulanger now admits the letter is genuine, but says it contains nothing but the ordinary forms of courtesy. For a soldier, a general and a Minister of War to equivocate or lie in this way is considered hardly honorable, and though the Republicans accept his explanation, he has lost greatly in reputation and a good deal in popularity..... De Lesseps has launched a new loan to continue the Panama Canal, and has been offered much more money than he asked for. Investors all French.....

AGRICULTURAL NEWS.

SATURDAY, August 7, 1886.

The Oleomargarine Law, as signed by the President, consists of 21 sections, and would fill over three columns of the RURAL. Section 1 defines butter as a food product made exclusively from milk or cream, or both, with or without coloring matter. Sec. 2 defines "oleomargarine" as all mixtures and compounds of oleomargarine, oleo, oleomargarine oil, butterine, lardine, suine and neutral; all lard extracts and tallow extracts; and all mixtures and compounds of tallow, beef fat, suet, lard, lard oil, vegetable oil, annatto and other coloring matter, intestinal fat and offal fat made in imitation or semblance of butter, or when so made, calculated or intended to be sold as butter or for butter. Sec. 3 imposes a special tax of $600 on every person who manufactures oleomargarine for sale. Wholesale dealers (all who sell "oleo" in the original packages) must pay $480. Retailers (those who sell less than 10 pounds at one time) must each pay a tax of $48. The manufacturers must register with the Internal Revenue Collector of the District, and the tax is due on May 1 each year; but if business began after June 30, the special tax is reckoned from July 1 of that year, and shall be $500. A Federal license, however, does not exempt anybody from any penalty or tax imposed by any State, or in any way authorize the commencement or continuance of business prohibited by any State. Sec. 4 provides that when business is carried on without the payment of the special tax, in addition to the payment of this, every guilty manufacturer must be fined not less than $1,000 or more than $5,000; every wholesaler, not less than $500 or more than $2,500; and every retailer not less than $50 or more than $500. Sec. 5 ordains that every manufacturer of "oleo" shall conduct his business in accordance with regulations issued by the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, and shall conduct it under the surveillance of such officers as may be appointed by the Commissioner, bonds to be given by satisfactory sureties for not less than $5,000, to be increased as the Commissioner may desire. Sec. 6 orders all "oleo" to be packed in firkins, tubs or wooden packages never before used for the purpose, and holding not less than 10 pounds each—all to be "marked, stamped and branded" as the Commissioner may prescribe. All sales by manufacturers and wholesalers must be in such packages. Retailers must sell only from such packages in quantities not exceeding 10 pounds, and must pack the "oleo" in wooden or paper packages marked or branded as the Commissioner may direct. Every dealer who violates this section shall be fined for each offense not more than $1,000 *and* be imprisoned *not less* than six months nor more than two years. Sec. 7 imposes a fine of $50 on every manufacturer who fails to affix on each package a label giving notice of its contents and a warning against destroying or removing the label; and a like fine is imposed on any one who does this. Sec. 8 imposes on "oleo" a tax of two cents per pound, to be paid by the manufacturers by means of coupon stamps, and the existing laws relating to stamps for tobacco and snuff shall apply to "oleo" stamps also. Sec. 9, authorizes the Commissioners of Internal Revenue to collect any tax which may have been evaded, in addition to the penalty imposed by law for such evasion. Sec. 10 imposes an internal revenue tax of 15 cents per pound on all imported "oleo," in addition to any import duty it may have to pay. The importer or owner is liable to all the penalties prescribed for manufacturers in the United States. Imported "oleo" must be put up in packages like those for the home product, and any dealer selling it not so put up shall be fined not less than $500 or more than $5,000, and be imprisoned not less than six months or more than two years. Sec. 11 imposes a fine of $50 on every person who knowingly purchases or receives for sale any "oleo" not branded or stamped according to law. Sec. 12 imposes a fine of $100 on all dealers who knowingly buy from any manufacturer who has not paid the special tax, and it forfeits the goods or the full value thereof. Sec. 13 ordains that any person who has an empty package of "oleo" must utterly destroy the stamps thereon under penalty of $50 and imprisonment of not less than 10 days or more than six months. Any one who fraudulently gives away, accepts, sells, buys or uses for packing "oleo" any such stamped package shall, for each offense, be fined not over $100 and be imprisoned not more than one year. Sec. 14 ordains that the Secretary of the Treasury shall appoint a chemist and microscopist at $2,500 a year each, for the office of the Commissioner of Internal Revenue, who may also employ other chemists and microscopists at suitable salaries. In contested cases he is authorized to decide whether a substance is or is not "oleo;" and as regards taxation his decision is final. He may also decide whether any imitation butter contains ingredients injurious to health; but in this case, if his decision is contested, an appeal can be made to a board composed of the Surgeon-Generals of the Army and Navy, and the Commissioner of Agriculture, and their decision shall be final..... .....
Sec. 16 provides that "oleo" for export need pay no tax, but every package containing it must be branded with the word "Oleomargarine" in plain Roman letters not less than half an inch square. Sec. 17 ordains that when any manufacturer defrauds or attempts to defraud the United States of the tax on his oleo, he shall forfeit the factory and apparatus together with all the oleo and raw material found in the place, and be fined not less than $500 or more than $5,000, and be imprisoned not less than six months or more than three years. Sec. 18 provides that if any manufacturer or dealer knowingly or willfully shall in any way whatever by commission or omission violate any provision of

the law he shall pay $1,000, if no specific penalty is imposed in other sections, and moreover, guilty manufacturers and wholesalers will forfeit all the oleo they own. Sec. 19 provides that all fines, penalties and forfeitures can be recovered in any court of competent jurisdiction. Sec. 20 charges the Commissioner of Internal Revenue to make all needful regulations to carry the act into effect. Sec. 21 provides that the act shall go into effect 90 days after the passage, and that all stocks of oleo on hand at that time must pay the two per cent tax, and be put up and branded as provided by section 6. The act was signed by the President on August 2, and will therefore go into effect on November 1.....The Vermont Horse Breeders' Association will have their annual meeting and races September 8, 9 and 10. Entries close August 30.....The New England Agricultural Society and the Eastern Maine State Fair will unite in a big cattle show and fair at Bangor, August 31, and September 1, 2 and 3, which will probably be the largest exhibition ever made in New England. Some of the best known horses of the Maritime Provinces and New England have already been entered.....John Brainbridge Booth, of Killerby, Catterick, Yorkshire, England, nephew of Richard Booth and brother of the late J. C. Booth, of Warlaby, died the other day. The Booths and Warlaby and Killerby are all famous in Short-horn story. J. B. B., was well-known as a Short-horn breeder, but still better as a breeder of horses.....

Considerable trouble at the Michigan Agricultural College between students and the Professor of Agriculture. This trouble is one of long standing, being handed down from class to class. The students preferred charges against the Professor, and the State Board of Agriculture met to investigate. The students presented their own case. The Board did not consider the charges well grounded enough to justify them in removing the Professor. For refusing to divulge the names of students connected with a cowardly trick played upon the Professor, one student was expelled. His class-mates at once demanded his re-admission. They were given a week to take back their demand. The senior class informed the Board that unless the student was taken back there would be no commencement exercises. At last the students concerned in the trick came forward and gave their names. They were turned over to the faculty for punishment. The juniors took back their demand, and the expelled student was taken back. Then the seniors voted, 18 to 11 to stay by their previous decision. The 18 who voted to make trouble were at once suspended. There was great excitement for a time, but the Board remained firm and the suspended students left college. Students who imagine they are running a State institution are apt to have their convictions rudely shaken.....

....A telegraut from Chicago this morning says 11 Chicago manufacturers of butterine and oleomargarine met yesterday to talk over the recent action of Congress regarding their industry, and to agree upon a plan to test the validity of the Oleomargarine Bill. The bill was discussed, and it was agreed that its constitutionality ought to be tried before the United States Supreme Court. Before the law goes into effect on Nov. 1, it is said, the manufacturers will probably take the first steps for redress, and a meeting of the National Oleomargarine and Butterine Association will be called within the next 30 days in Chicago. There are 25 firms in the National Association .....

....Last Saturday, the House by a vote of 209 to 6 passed the Alien Landlord Bill. It provides that no non-resident alien or foreigner, nor any resident alien or foreigner, who has not declared his intention to become a citizen of the United States, nor any corporation nor association when nt most one-tenth of its stock or right of property is owned or controlled by aliens or foreigners, shall acquire or own, hold or possess, by right, title or descent, accruing hereafter, any real estate in any of the Territories of the United States; provided that the provisions of this act shall not apply to the real estate necessary for the construction and operation of any railroad..... The Commissioner of Agriculture has decided to locate the new silk factory, to be established in connection with the Agricultural Department, in the annex to the Department building, and to operate it with the Department employés. While the manufacture will only be on an experimental scale, the machinery, though not extensive, will be complete. The Department will make no effort to furnish the the raw material, but will purchase it wherever obtainable, being content, at present, with experiments in the manufacture of silk..

A CHURCH at Cornwall, Ill., has long been inhabited by swarms of bees. They finally became so plentiful that they drove out pastor and congregation. Last week a party of men ripped open the side of the church and found that the bees had piled up honey in the wall to the hight of 16 feet. The honey was confiscated and the bees were driven out.....

..At a meeting of the Parnellites in Dublin, Wednesday, a resolution introduced by Parnell, was unanimously passed, warning the Government that the low prices of farm products since the present rates of rents were fixed makes it impossible for tenants to pay their rents, and an immediate revision of the rates was urged with a view to lower them still more and give greater security to tenants, and a suspension of eviction for non-payment of rent was "recommended."..... ....

At the recent picking of the ostriches on the farm near Norwalk, Cal., 50 pounds of feathers were obtained, worth $160 per pound, or $8,000 for the pick. The birds are picked once in about six or seven months, and they are doing well.....

Crops & Markets.

SATURDAY, Aug. 6, 1886.

The prolonged and serious drought, says the Chicago Farmer's Review, which has materially shortened the spring wheat crop and caused a serious menace to the corn crop, was partially broken this week, copious rains having fallen in Kansas and part of Missouri. The injury which corn has sustained cannot yet be determined from the reports. Nearly one-third of the counties of Illinois, Missouri and Kansas report that corn, while showing the effect of the drought, has not been seriously injured, and will make a fine yield if rain should come in time. The remaining counties report more or less injury, the tenor of the reports being very discouraging, declaring that many of the fields have already felt the blight, and predicting not to exceed one-half the ordinary yield. The outlook is reported especially gloomy throughout the entire corn belt for all late planted corn. One-half of the Iowa counties report that serious injury has already befallen the corn-fields, and that the yield for the State will fall short of an average by from 25 to 40 per cent. In Ringgold and Warren Counties, corn does not promise one-half of an ordinary yield. The corn outlook in Minnesota is more favorable, with the prospect of an average yield with continued rains. In Wisconsin the tenor of the reports does not indicate to exceed two-thirds of an ordinary crop. In portions of the State there has been no rain for six weeks, and all the crops are a bad failure. In Ohio, Indiana and Michigan, the outlook is still favorable for an average yield of corn. The reports indicate a very short flax yield, and in the entire Western and North-western belt, the outlook for potatoes is very poor. Texas crops are better this year than last. The severe drought prevailed mostly in Western Texas in the cattle region, and in some instances settlers have abandoned their homes, going eastward to escape starvation. Very few cattle have died, and the pitiful stories of starving people are without foundation. Crops in Eastern Texas are better than in years.....

..Yesterday the Omaha Bee published the results of crop reports from nearly every county in Nebraska, and it appears that from 15 miles west, south and north of Omaha to the boundaries of the State, there has been a large amount of rain. In a few instances it came too late for corn, but the general average will be fully three-fourths of the usual yield of corn. Barley has been unusually productive. Wheat has thrashed at the least 18 bushels to the acre throughout the State. There has been a fair crop of oats, and root products are in fine condition and abundant. The wild grass has suffered the most, but all tame varieties sown are equal in every respect to a bountiful yield. Farmers everywhere are well satisfied, arguing that it is better to have an average crop with good prices than a large yield with no paying market.

The grape growers of Southern New Jersey claim that this year's yield will be almost entirely destroyed by black rot, a dreaded scourge, caused by wet weather. In the lowlands and in the timber country the devastation has been most severe. In the vicinity of Egg Harbor City, the greatest wine-producing district in the Middle States, the loss will be about $50,000, mostly wine grapes.

A cablegram from London, Wednesday says, an active demand has prevailed for wool. Six thousand bales of Australian and Cape have been sold at a penny advance. A series of sales was opened at Antwerp on August 2; prices were 25 per cent. dearer than those of May.

Less doing here in raw wool, but the market favors holders. Prices depend on the results of the openings of light-weight fabrics, which are not fully known. There has evidently not been so general an advance as expected, though late London and Antwerp sales have been at full figures. Latest advices from the spring-wheat crop are more favorable than previously anticipated. Heavy receipts continue to depress prices. The damage to corn from drought is also less than was recently reported, the probable yield being nearly 1,600,000,000 bushels against 1,940,000,000 bushels last year. There has been slight damage to the cotton crop from shedding. The plant has improved in the Carolinas, Georgia and Alabama. Hot weather has threatened central and western Texas. The Louisiana rice crop promises to be heavy. The weather of late has been unfavorable to the growth of the sugar cane in that State. The price of sugar has gone to the lowest point on record, with a light demand and with heavy probable supplies.

Telegrams this morning: St. Louis, good showers have improved crops; corn and tobacco not yet beyond recall, if rains are general. Milwaukee, Wis. Barley and rye fine crops; oats and wheat light, but of excellent quality. Farmers in better spirits. St. Jo., Mo. Drought still greatly injuring corn. Kansas City, Mo. Late rains have assured good crops. More hopeful feeling everywhere. Davenport, Ia. Recent rains have revived crops much damaged by drought. Duluth, Minn. Harvesting progressing; feeling about grain better than since harvesting began. Omaha, Neb. Crop reports from all over the State still favorable. Plenty of rain everywhere. Minneapolis, Minn. Weather cool and very favorable for harvesting. Spring wheat of the best quality ever grown. Crop much lighter in Dakota than in years.

MARKETS BY TELEGRAPH.

SATURDAY, August 7, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is ½c. higher; No. 2 Spring, ¾c. higher. Corn, ⅝c. lower; Flaxseed, 1½c. higher. Pork, 25c. lower. Cattle, a shade lower. Hogs, average steady. Sheep, some grades higher; others lower.

WHEAT.—Firm; Sales ranged: August, 74¼@75¼c; Sept., 76⅛@77¾c; October, 78¼@78¾c; No. 2 Spring, 74½c. CORN.—Firm: cash, 43⅜c; August, 42⅝@43⅜c; September, 43¼@44⅝c; October, 44¼@45⅛. OATS.—Steady; Sales ranged: Cash, 31¼c; August, 27¼@27¾c; September, 28¾@29⅛c; October, 29⅜@29¾c. RYE.—Quiet; No. 2, 53c. BARLEY.—September, 62@62½c. FLAXSEED.—No. 1, $1 13¼. MESS PORK.—Steady; Sales ranged. Cash, $9 55@9 75; August, $9 55@9 57½; September, $9 47½@9 62½; October, $9 52½@9 72½. DYSPEPSIA.
Its Nature, Causes, Prevention, and Cure.
Being the result of actual experience with Dyspepsia
By JOHN H. McALVIN, LOWELL, MASS. Fourteen years Tax Collector. Sent free to any address.

For the Young.

THINK THIS OVER.

"Now here's the secret that doth lie
In every great life's plan,
His work—it was a man's work
He did it like a man."

There's a point for you young man
In this short verse above—
It will help you when you plan,
To win at work or love.

All the blanks of life come in
To those who try to shirk;
And the only men who win,
Take off their coats and work.

For the world is like a rock,
Where each must carve his name,
The strong with a sturdy shock,
The weak with fear and shame.

And the gray moss hides the work
Of those who strike in fear,
Of the men who run or shirk
When trouble's form comes near.

But the years can never hide
The work of these who know
That their strength, their hope their pride
Goes into every blow.

Get up from your chair, young man,
Don't sit like a lazy Turk,
Success has a better plan,
Take off your coat and work.

THE weather is much cooler. We have had a very sudden change in this part of the country. These quick changes from heat to cold and from cold to heat are dangerous. People are apt to take cold, for they are not prepared for the change. A summer cold is very disagreeable. It seems to throw things all out of shape. The sun is shining and the air is warm and pleasant, and yet your nose and head are all "stuffed up." Be careful during this changeable weather. If the temperature changes so that the mercury drops 30 degrees, you will need more clothing on. Don't think you know more about such things than your elders. You do not.

ALMOST every person drinks tea or coffee, but I never could see what good it does them to do so. I think it is more of a habit than anything else—it may grow into a very bad habit. I have seen men and women who had injured themselves severely by drinking too much tea and coffee. Of course they drank great quantities of a very strong mixture, but they all had to begin with small doses. As I have often said, I believe in temperance even in the use of water. I think milk is the best drink. Some people want a warm drink in the Winter, and I am sure that a cup of warm water with a little sugar and milk in it will do just as much good as a cup of coffee. I have lived in places where they made a drink out of roasted rye or beans or carrots. The people appeared to like these drinks, but it always seemed to me that they wanted them because they were warm, rather than for any nourishment there might be in them. I am always sorry to see people giving coffee to a baby or a young boy or girl. I think such a practice is all wrong.

WE have a parrot at our house. One morning we heard a very strange noise down by the barn, and on hunting it up we found this parrot perched up in a tree. A man walked up unseen and caught the parrot by the leg. How he did scream and bite. We have him in a large cage now. He can't talk, but he keeps up a great screaming, particularly when he is hungry or angry. He is very fond of corn. It is funny to see him eat the grain. With his hooked upper bill he tears the germs out of all the kernels. He seems to like the germ best of all; then he eats the rest of the grain more slowly. I have an idea this parrot flew away from the city. He is not a country bird by any means.

EVERY farmer's boy in this country, who has good health, holds in his head and hands the chance to make a fortune. Don't ever forget that. The fortune may come in various ways—money, a good farm, knowledge or other good things. The point to be understood is that any stout boy can make about what he wants to out of himself if he will only think so. It takes patience, perseverance and courage, but it is worth all it costs to be able to say: "I made myself." I want our boys to think this over. There is no use in giving up and saying: "Its no use, I can't do these things." You can do them if you will only think so. Boys must save all they can. Get a bank account started just as soon as you can. No matter if you only have 10 cents to put in, make a start. Take care of your health. Keep out of all bad habits. Think about your work and don't let your mind run to play, except while you are playing. Read all the good books you can and let all dime novels go into the fire, where they belong. Watch your chances and keep cool, and you will come out all right.

I WANT our girls to can corn enough to last all Winter. I am very fond of sweet corn. There can't be too much of it in the house—in my estimation. It is as good as canned fruit. There should be enough put up so that the family can have some every day. I don't believe in doing such things by halves, you see. This idea of putting up a little fruit and a little corn so that the people get only a taste of it now and then, doesn't suit me at all. I want enough to eat, and I don't believe in playing the miser with any healthful food just because it is good. I don't feel much like telling how to put up corn, because our girls know a great deal more about cooking than I do. I know how our folks prepare it though, and I know it is good enough for me. They cut the corn from the ears and place it in glass jars, crowding it down hard. Then the tops are screwed tightly on, and the jars are placed in a wash boiler of water. Cloths are placed between the jars, and the water is boiled for three hours. When that corn comes out in the Winter it is fit for kings. I hope our boys and girls will have tons of it to eat this Winter. If there is any better way of cooking it, I want to know about it.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

"BUT why can't a man go in there and reform the school? If he minds his own business he'll get along all right;" I said, strong in my belief.

"I expect ye ain't never taught no deestrict school hev ye? Don't you never try no reformin' over yunder. You keep yer bones hull an' git through yer time an' you'll find you've hed job enough fer one year. Ye needn't tell nobody I told ye so, but I'd jes as soon teach in Africky as ter teach to Bear Crick. I went over thar last Winter fer ter visit schools, an' thar set a big feller, 50 pounds heavier'n you be, an' them boys hed him so'st he didn't dare fer ter wink. I set thar till a piece o' sweet cake hit me in the neck, an' then I gut up and went out. I never sed nothin', but thet's jest what Bear Crick is."

I shall always think he took pity on me in his examination. Doubtless he felt that he who took his life in his own hands and marched against Bear Creek ought to have his burden made as light as possible.

"I ain't a gonter give ye no searchin' examination; I'll jest ask ye a few ramblin' questions so'st ter go through the motions. Now, you take the word 'please.' Kin that be used in any other way than as a verb?"

"Yes," I answered after a moment's thought —"as a noun."

The spectacles fairly slipped down over the nose in their excitement at this answer. The examiner leaned back with a loud laugh of satisfaction. The tight coat improved the opportunity to grasp his shoulders with a tighter grasp.

"I sorter figgered on that. I knowed that would ketch ye. Ain't many on 'em kin git round that. Ain't much on grammar up to college, be they? Now I've gut me a dictionary here—I wish you'd sorter pick it up an' show me where please comes in fer a noun."

He laughed again as he brought a rusty old dictionary and placed it in my hand.

"You fellers don't know it all yet, do ye? We kin stump ye yet. I'm sorter hungry to see that noun please."

I turned over the leaves and pointed to the word p l e a, and read the definition, and then gave the plural, p l e a s.

"But that aint what I sed. I sed please—the verb—jest like please do this, and please do that. I aint talkin' about nothin' else."

The spectacles crawled back on the nose, and the coat took another grip at the shoulders. The examiner was wise in his way. He had run for office in Clay Valley too many times to push anything that savored in the least of uncertainty. He made haste to take the book away.

"Gut a putty fair grip on grammar, aint ye? 'Pears ter me ye must hev made a meal or so o' dictionary. Now, I'll see how ye be on figgers. Guess I kin pass ye on grammar, seein's they aint no great call fer it over to Bear Crick."

He handed me a large slate that had been resting on the shelf over the stove.

"Ye kin do yer figgerin' on that. Now, 'sposin' I had three hosses worth $100 apiece, and six cows worth $50 apiece. The hosses kin earn $2 a day workin' on the road. 'Sposin' them cows ter everage 10 quarts o' milk a day, which pays the best, figgerin' hay, an' grain, an' milk, an' butter at the goin' prices? That's the sort o' figgerin' we want done down here. You work that out, and I won't ask ye no more questions."

My work on the college farm helped me here. I had handled stock enough to form a fair idea of the amount of food consumed by an animal and the proportion of butter to milk. I worked the question out carefully, knowing that it would lead to a long discussion. I threw in all the long chemical terms I could remember, hopelessly jumbling them together for the benefit of the examiner. I think I proved the advantage to rest with the cows. Mr. Greening came and studied the problem when I put the slate down. He appeared surprised to think that I had worked it out at all. He was bound to find fault. That, in his opinion, was what his office was created for.

"Gouter feed them hosses on medder hay, aint ye? Ye can't get no sech hay ez I've gut fer no sech price. Then agin, 'pears ter me ye gut them cows givin' solid butter, an' ye gut my family drinkin' nigh onter a gallon o' milk apiece. Then agin, what's them?"—and he pointed to a long list of crippled chemical terms that would have injured my reputation forever in the eyes of my professor of chemistry.

"I thought I'd put in a few of the chemical elements, so that we could get nearer the cost of feeding. There's a phosphatic carbo-hydrate, a nitrogenous albuminoid, and a double sulphate of a sesqui-oxide, and"—

"I guess that'll do. I expect you've figgered it down clos't enough. Them big words sorter shave the profits off en the hosses. Guess I'll make me a copy o' thet, so'st I kin use it when the next teacher comes by."

The examination was over, and armed with the precious certificate, I started at once for Bear Creek.

(To be continued.)

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I live on a farm of 175 acres, and a large river runs through it, full of all kinds of fish. We have 10 cows and 18 steers. Just now we are making lots of butter. We have 40 hens; one lays such a small egg and there is no yelk in it. Don't you think that is funny? I have to walk a mile to school. We have seven months' school in the year. I am 13 years old, and the only one at home. I have one sister, but she is married. I have planted the Rural Treasures, and hope they will do better than they did last year. Only a few blossomed, it was so cold. I had a lovely canary bird. I hung it out-of-doors, and a wild bird flew against the cage and killed it. Papa said if I would try for the plow and get it, he would get me two new pairs of shoes. I have looked all through the big dictionary and found all I could. Your niece, MAUD RAYMOND.

[That egg is queer enough. Too bad about the bird. Sorry you did not win the plow.—U. M.]

DEAR UNCLE MARK: I would like to join the club if you would let me. I am 13 years old, and live in Schuyler Co., two miles from Burdette, on a farm with our Grandfather. I have one sister. Mother says Grandpa has taken the RURAL more or less since it first started, and we like it very much. We cultivate a great many summer flowers. I have a nice bed of pansies. I have not done much in the line of gardening. I like to raise stock and poultry best. We keep three cows. One of them is a Jersey, and Grandpa gave her calf to sister and I. We keep her in a stable most of the time. Her name is Flossie. I feed her milk three times a day, with cooked oil-meal morning and night, and a cup of oats at noon; then the curry-comb and lots of kindness will do the rest. Sister and I sold two yearlings for $30, and we have a fine young cow which we call Topsy. I have raised 51 chickens this Summer, and expect some little turkeys soon. Sister and I always save some of the money to take a paper. The name of it is the Youth's Companion. I have raised 13 canary birds, and have sold some of them. They make lots of music. I like all kinds of farm work, and house-work, too. I will stop, for fear of the waste basket.

Hector, N. Y. LENA BENNETT.

[You are fine stock farmers. A great many men could learn lessons from you.—U. M.]

DEAR UNCLE MARK: As I have not seen very many letters from this State, I hope you will not forget to print this. It is very dry here. We must go 1⅝ miles in order to get our cattle watered. We live 14 miles from Green Bay, and one mile from Neshoto River. You may wonder why I say we have to go 1⅝ miles in order to get our cattle watered. It is because there is a large field of wheat just near the river. In the Summer we can find many wild fruits, such as strawberries, raspberries, blackberries, cranberries, etc. The cranberries are of two kinds—high-bush cranberries and low-bush cranberries. But it is too dry to grow anything, and also too dry to keep water in the wells. There will hardly be any berries this year. My Papa is in Iowa at present, visiting my uncle. My uncle has 200 hens, 64 cattle, and I don't know how many turkeys. They have also four horses and one colt. Your nephew.

Brown Co., Wis. LEWIS W. PETERSON.

[We must have plenty of water. Without it we can do little work.—U. M.]

DEAR UNCLE MARK: I am a little girl 10 years old and I want to ask you if I can join your club. My brother gave me the pea seed that you sent him and I planted them and they came up, but the rabbits ate them. I have a flower garden, a pet hen, a cat, four kittens and a calf and two mocking birds. I have two sisters and three brothers.

Dennison, Texas. FERN MUNSON.

[We are glad to hear from you. What a lot of pets you have.—U. M.]

DEAR UNCLE MARK: I am a little boy 11 years old. I took your advice and set that hen on 11 Guinea eggs. I will tell you her success. I am going to try for the melon prize. I have beds of carrots, onions, lettuce, beets, peas, radishes, corn, melons, tomatoes, cabbages and beans. The Alaska Peas are in pods. I planted the Garden Treasures, but the calves got in and killed them all. I go trout fishing sometimes.

Your nephew, JAMES STEVENS.

Kirkdale, P. Q.

UNCLE MARK: My other letter was not printed, but I am not discouraged. We are having a rainy season now, it has rained so much on some of the hay it is not fit to put in the barn. Some of the farmers have spread their hay on the fields to rot. We have a great many flowers this year. There were a great many poppies among the Garden Treasures. A great many of the flowers we did not know the names of. We do not like the Horsford pea, it is bitter after it is cooked, we like the Prince Albert the best. We have three colts, their names are Prince, Jenny and Nell. I should think you would have quite a time to keep in memory all the nieces and nephews.

Your niece, INEZ G. MOON.

Oswego Co., N. Y.

[It is lucky my memory is good—U. M.]

DEAR UNCLE MARK: If I will not tire you I would like to ask if you found 105,000 different words in "Clinton Chilled Plow," or, that was the whole number which you received from all the Cousins. My sister thinks they could not have been all different. I think you must have been completely tired out with them. Too bad you had not an Aunt Mark to help you. You are so patient with the boys and girls I thought you must have several of your own. Those were funny verses about "A Memory" in the RURAL. Mrs. Brooks said she should think they might to be spoken in our school. I think that boy and girl must feel very happy at receiving their plows.

Your niece,

HATTIE BELLE HOTCHKISS.

[I added all the words, on all the lists together.—U. M.]

DEAR UNCLE MARK: I suppose you will say another "county heard from." This is King County, W. T. As I was reading the letters from the Cousins, I wondered what they all looked like, or what Uncle Mark was like. I wish you would have your picture in the RURAL, as Mary Wager-Fisher did, then we could all see our uncle. I will not describe myself until I see if this makes its appearance in the paper; then I will tell you what I am like, and see if you want me for a niece. We live four miles from Seattle, that Queen city you read so much about. My Father has a hop ranch, and I have raised 31 canary birds to sell to the Indians when they come to pick hops. I get $5 a pair for them. The young Indians are very fond of pets. I will not write any more at present, but if I hear from this I will describe our place and my occupation while out of school.

Duwamish. MAUD M. HORTON.

[Let us here from you again by all means. I guess I had better keep my picture out of print.—U. M.]

Miscellaneous Advertising.

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

PERSONALS.

COL. FRED. GRANT denies that there has been any serious disagreement between Mrs. Sartoris and her husband.

THE Princess Dolgorouki, widow of the late Czar Alexander II., is credited with possessing a fortune of $20,000,000.

SECRETARY LAMAR is going to make personal inspection of the Indian country to aid him in solving the Indian problem.

C. P. HUNTINGTON, the great millionaire and railroad magnate, was once a poor country boy, and presided at one period over a small shop at Litchfield, Connecticut. He is a remarkable civil personage.

"I AM too old to quarrel, too old to boast. 'The man of sense in his old age likes to be let alone.'" Thus writes Jefferson Davis from his Mississippi plantation. Wasn't that what he and the South wanted some years ago?

EX-LIEUT. GREEN, who struck John Brown murderously with his saber after the old man had surrendered at Harper's Ferry, was made an Indian agent, but has turned out such a poor one that Secretary Lamar will get rid of him.

GEN. HARNEY, of the United States Army, is the oldest man on the register. He became a soldier in 1818, and participated in every war in which the country has engaged since that time. He is 86 years of age and very rich.

SINCE the death of King Ludwig, of Bavaria, the insane King Otto has been under delusion that he is a bird. He has called himself the great "German double eagle," and he has even built a nest of straw and dry leaves in his apartment.

AT Shanesville, Pa., Elizabeth Trout, aged 92; Maria Updegrove, 82; and Maria Trout, 76, while the harvesting was being done this Summer, assisted the men during the whole of one long day, and each of them bound the heavy sheaves, such as are usually left for the strongest men.

THE Rev. E. C. Haddock, of Sioux City, Ia., was shot and killed in the street Tuesday night by some unknown assassin. He was an earnest worker for the enforcement of the prohibition laws, and had been frequently threatened by the rumsellers, and his death is attributed to them. Great excitement throughout that section.

THE United States Senate has authorized an investigation of the international fishery question this Summer, and appointed a very strong committee to carry it out—Edmunds, Frye, Evarts, Morgan of Alabama and Saulsbury of Delaware. Mr. Edmunds says "This means business" and that the "committee will go to the bottom of the matter."

A MINNESOTA farmer became enraged a few days ago at an old hen that had sat for six weeks in his barn on a door-knob and two iron spikes. He manufactured a bomb and exploded it under her. The result was strikingly successful. The hen has not been seen since. Neither has the barn. There was no insurance on either.

THE Republicans of California, in the extra session of the Legislature, have elected A. P. Williams, a prominent San Francisco merchant and Chairman of their State Committee, United States Senator to succeed the late Senator Miller. Makeshift Hearst, the Democratic candidate, got only 24 votes in both Houses, against 70 for Williams.

PROF. FERAND and Maj. Alvord have accepted, respectively, the Presidency and Professorship of Agriculture to which they were elected in the Mass. Agricultural College. Ex-President Greenough's friends on the Board of Trustees wished him to remain, teaching the course he taught before; but after a vigorous debate, the opposition was so strong that the motion to that effect was withdrawn without a vote.

GENERAL BOULANGER, who has suddenly flashed up so brightly in France, was born at Rennes, the old capital of ancient Brittany, and had an English mother. His father was a lawyer. The very name Boulanger (signifying baker) has started the wits of Paris, who do not happen to admire the General, at their usual task of satire. A military club he lately founded is called the Boulangerie (bakery) and the witlings are playing on the name in a hundred other ways.

THE French aeronaut L'Hoste and a companion, the other day, or rather night, traveled across the English Channel from Cherburg to London in a newly invented baloon capable of being steered through the air. The baloon landed within a few miles of the open space for which it started, and passed within a mile of it, but couldn't land on account of the houses. "Toy" torpedoes were dropped on vessels, forts, etc., over which the baloon passed; and in war the same could be done with dynamite bombs. Such baloons, it is thought, are likely to be very destructive in war, and very sensational at all times. Is it the beginning of a new era in aeronautics?

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
In my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
"This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTLE, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & Co., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis
"It gives satisfaction every time."—J. G. BARTLETT & SON, Sunbrook, N. H.
"It has never failed to arrest the disease yet." JONES & MUSSELMAN, St Paris O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.

The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, **$2.50, $1.25,** and **50 cents** per package. 25 pound cans, **$12.50.**

The Latest Improvement
IN
Traction Engines.

The only Engines where the power is practically and successfully applied to the four truck wheels. Exceeds all other Traction Engines in pulling and steering through mud holes, sand, or any soft or uneven ground, or on any road. Is the result accumulated from a third of a century of study and practical experience in the manufacture of

PORTABLE,
Agricultural & Stationary Steam Engines.

With determined policy to build only the BEST MACHINERY from the BEST MATERIALS, and in the BEST MANNER OF CONSTRUCTION, and with continued improvements, have attained the HIGHEST STANDARD in excellence of workmanship, simplicity of design, and capacity of power.

In addition to our STANDARD ENGINES we now offer the first ROAD ENGINE which has the Traction Power practically and efficiently applied to the four truck wheels, and while so applied to each wheel independently, the forward axle is under full control of the steering apparatus.

Descriptive catalogue will be sent on application.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1908. NEW YORK, AUGUST 21, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Floricultural.

VIBURNUM PLICATUM.

A FEW words as to the hardy shrub, Viburnum plicatum — Plicate-leaved Viburnum, or Japan Snowball. As to foliage and habit there are few finer shrubs. To develop its full beauty, specimens should not be crowded or shaded by other plants. The leaf is shown in Fig. 325, true to nature. But its rich, dark-green color, which becomes purplish in the Fall, and is held until frost, can not be shown in a mere engraving. Its balls of flowers begin to open the middle of May—earlier or later as the season may be, lasting a full month fresh and perfect. Even after they have fallen they often retain their bloom. With many flowers the petals drop or wither on the stem; but with this the entire head drops. In favorable situations the flowers will average four inches in diameter. These balls are made up of two kinds of flowers. The outer ones are nearly an inch in diameter without either the rudiments of pistils or stamens. Beneath these and almost sessile upon the pedicels are little flowers a quarter of an inch in diameter, which bear five stamens though no pistil, and but the rudiments of an ovary. When first opening, the flowers have a faint tint of green, which, later, disappears, leaving them snowy white. The leaves are roundish-ovate on the old wood, elliptical on the new. They are strongly creased or plicated and sharply toothed. Our several specimens are perfectly hardy, and, except that the flowers are without odor, the shrub seems faultless. Few would care to preserve the old Guelder Rose (Viburnum opulus), with its coarse leaves and crooked stems, after seeing good specimens of the Japan Snowball, as it has been called, though it comes from Northern China. The specimen from which our illustration was drawn and engraved was cut June 1.

Arboricultural.

TREE NOTES.

THE GOLDEN ELDER, when in perfection, is a beautiful shrub, hardy, vigorous and showy, and it retains its yellow color all Summer long. But it now has, and has had all Summer long with us, a lot of "scalded," unsightly leaves that no amount of golden coloring can compensate for.

THE OAK-LEAVED HYDRANGEA is in good bloom with us just now, and has been so since about July 7. When in vigorous and healthy condition and in full leaf it is a good-looking shrub anyway; but its habit of blooming conspicuously as it does in July, renders it exceptionally welcome. It is a native of the Southern States and hardy with us, but it is not considered generally hardy in the North. [It is not quite hardy at the Rural Grounds. But the roots are never killed.—EDS.]

THE DWARF HORSE-CHESTNUT is one of the most conspicuous of July blooming shrubs, and is seen to best advantage when in a mass by itself. But although I regard it as one of the most desirable of garden shrubs, I would not recommend it for a little suburban garden.

SOME ASH TREES.—The leaves of the Aucuba-leaved Ash are much speckled with yellow and in masses are effective, but between bark scales and borers the tree with us is a nuisance. The Fern-leaved (Scolopendrifolia), Single-leaved (Monophylla), Potamophylla and some others have been so afflicted with borers, that I have grubbed them up and burned them.

CATALPAS.—C. bignonioides is just going out of bloom with us; C. speciosa bloomed with us four weeks ago; C. Kœmpferi isn't worth growing as an ornamental tree; nor unless you want a bunchy bush of leaves is C. Bungei. No other July blooming tree surpasses the common catalpa in floral display. But I don't know of a dirtier tree in the garden; every day in the year it makes a mess with its falling "bean" pods.

THE YELLOW-WOOD.—The RURAL spoke recently of the Yellow-Wood being a messy tree, dropping some of its leaves during Summer. With us it is better behaved. We have several fine specimens twelve or fourteen years old. They retain their leaves better than most trees and bloom lavishly every second year. There is a Yellow-Wood tree in the Botanic Garden, Cambridge, which I measured in 1878. It was then 47 feet high and 6 feet five inches in circumference of trunk at three feet from the ground. It didn't drop its leaves to any noticeable extent in Summer. But no matter how bad it may be in this direction, surely it cannot compare with plane trees, horse-chestnuts and elms. I regard the Yellow-Wood as one of the loveliest and most desirable of all hardy trees for ornamental use, and I am glad you concur with me in this opinion.. [And we are glad to be be supported in our views by Mr. Falconer.]—ED.

W. FALCONER.

VIBURNUM PLICATUM (JAPAN SNOWBALL). From Nature. Fig. 325.

BASSWOOD *vs.* YELLOW-WOOD.

I AM interested in what the RURAL says of the beauty and charms of the Yellow-Wood—Claadrastis tinctoria—otherwise Virgilia lutea. But considering it is a native farther South, and therefore not hardy North in exposed situations, is it to be preferred to the basswood—Tilia Americana. On the black soil prairie this is one of our most valuable soft-wood trees. It transplants readily, grows fast, recovers quickly from accidents to trunk and limbs, successfully resists the tramping of stock; the roots do not seek wells, nor enter and stop drains, like the willow, and it is perfectly hardy on high land and low. Besides, being round-headed and symmetrical in shape, it attains large size and lives to great age; and for two weeks in June, well-grown trees show a mass of fragrant bloom sought for by innumerable bees. B. F. J.

Champaign, Ill.

Horticultural.

KILLING PLANTS WITH KINDNESS.

WE have been applying nitrate of soda to spring-planted strawberries. Where the nitrate touched the leaves it burned holes as though the leaves had been pierced with red-hot irons. [Similar effects upon corn plants at the R. G. occurred three years ago.—EDS.] Two rows, side by side, one Crescent, one Daniel Boone planted much later than the others, were destroyed by the same application of nitrate of soda given to all the other varieties, and which benefited all the others, a small teaspoonful being applied to each plant, in a circle six inches distant therefrom. We are at loss to know why the two rows should be so differently affected from the others. Our foreman thinks it is owing to the immature condition of the roots of the plants most recently planted. If this is the cause it is important, teaching that the nitrate should not be applied until the plants have made two months' growth. Nearly as many plants are killed by kindness as by neglect. A man sent to plant the Earhart Raspberry put too much hen manure (composted with muck) about the plants and many died. A friend writes that all the plants we sent him last Spring started well, but he destroyed them by applying liquid manure not sufficiently diluted. How often trees are killed by placing manure in contact with the roots, or in excess near them, by excessive surface watering, causing the soil to bake; how often plants and vines are injured by some fanciful experiment, by too close or deep culture in Summer, or smothering in Winter. The safest time to enrich the soil is before planting, having the manure well rotted and mixed through the mold when wanted. Further fertilizing after planting will often largely increase the growth; but such work should not be left to careless or inexperienced help. CHAS. A. GREEN.

THE "CRIMSON CLUSTER" STRAWBERRY.

I NOTICE that your correspondent, E. Williams, in the RURAL of August 7, criticises the change that we have made in the name of this strawberry from King Cluster to Crimson Cluster. Had the King Cluster (as Mr. Williams claims it should be called, been sold and distributed, then his censure for the change of name would have been perfectly proper and deserved; but inasmuch as Mr. Durand had not sold or given away a single plant of this strawberry until we purchased it of him this season, I do not see why we had not the right to change the name, which we did with his consent. I have had some experience in the nomenclature of plants, and have always held that as far as possible, there are two things to be considered in a name, if they can be applied: first, that it should be descriptive as far as possible, and, second, that the name if consisting of two words, should be euphonious. Consequently, when we call a cauliflower Snowball, a celery White Plume and a rose Sunset, in every case the name answers the purpose of a partial description of shape or color. It was for this reason we took the liberty of changing the rather unmeaning name of King Cluster to that which so well

describes this beautiful variety—Crimson Cluster. PETER HENDERSON.

A GOOD WORD FOR THE LUCRETIA.

I CAN hardly agree with the RURAL in its estimate of the Lucretia Dewberry. In mild climates where the finer sorts of blackberries can be grown without protection, the objections the RURAL urges against it may have some force, but not in localities where the Lawton, Kittatinny and Wilson winter-kill about four years in five. With us there is no hardy blackberry that equals the Lucretia in size of fruit; hence it fills a very important place. It is earlier than the Snyder and is nearly gone before wild blackberries become plentiful, therefore it is almost without competition in the market throughout the greater part of its season.

There are some objections to it surely, but we can bear with its failings until we find something better. When the vines are pruned in the Spring some sort of litter should be scattered alongside to prevent the fruit from becoming dirty. The pruning may be done in the Fall and the litter be thrown over the plants and then raked off in the Spring and placed alongside. Whether the cost of mulching the dewberry is less than that of bending down and covering blackberry canes with dirt, I am unable to say, but one thing is true—that with the system named above the Lucretia gives good fruit and plenty of it, and for this latitude it is a real acquisition.

Ex. Sta., Columbus, O. W. J. GREEN.

THE BAGNARD BLACKBERRY.

ON July 29, we received from Muscatine, Ia., specimens of a blackberry twig bearing four ripe berries. It originated on the grounds of Mr. Bagnard, and will be called the Bagnard Blackberry. We are told that it is a seedling of the Snyder, and that it possesses the peculiarity of not sprouting from the roots. It propagates itself from the tips like black-cap raspberries. Pruned, the bush is quite stocky and upright in habit. This is the first season it has fruited, and when it is taken into consideration that the drought there has been so severe that the blackberry crop (Snyders, etc.), is almost a failure, the specimens were excellent. They were received in good order, and were as large as Wilsons and much the same shape. Very sweet and tender. The plant is reported to be perfectly hardy at Muscatine, where it is growing among a lot of Snyders.

MARLBORO AND SNYDER IN KANSAS.

MARLBORO Raspberry partly killed last Winter. The berries are large, but I do like the flavor; still I prefer them to the Turner. I don't recommend the Snyder blackberry for this section. It is worthless. Half of the fruit dries on the bushes when Kittatinny ripens every berry. E. M. C.

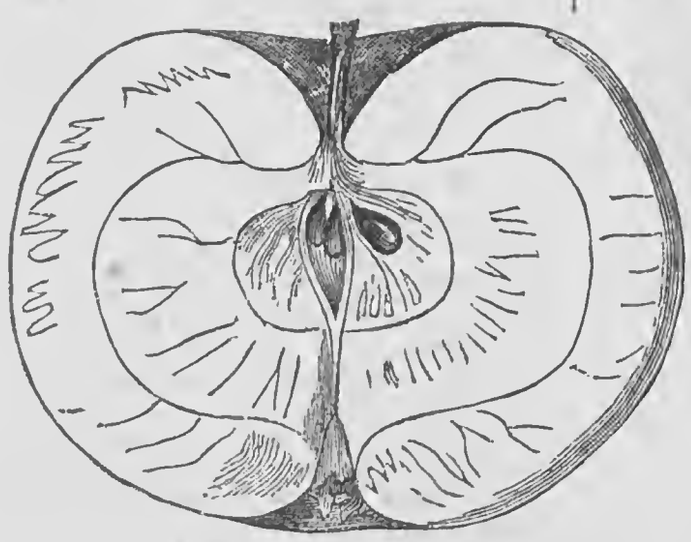
Crawford Co., Kans.

Pomological.

THE ANIS FAMILY OF THE APPLE.

PROF. J. L. BUDD.

WE have reason to believe that the hardiest race of really good winter apples in the world, for the far North, is found in the Province of Kazan on the upper Volga, in Russia. A glance at the map will show that the city of Kazan in near the 57th parallel of north latitude, and fully one thousand miles inland. It is difficult to imagine a more trying climate, as the prevailing winds of Summer are from the desert plains of Central Asia and Southeast Russia, and the extreme cold of Winter often reaches 50 to 58 degrees below zero with little or no snow; yet on the bluffs and high prairies, within 12 miles of Kazan, may be found hundreds of orchards—some of them covering at least 30 acres—which rarely fail to produce bountiful crops of fine, high-colored fruit of really good quality.



ANIS ALUI APPLE. Fig. 326.

The king winter apple of this region, grown in immense quantity for home use and export, is the Anis. As it is an ancient variety of this region, it naturally has sported into a number of sub-varieties differing slightly in color and season; but not materially in size or quality. The cut, Fig. 326, traced from an average specimen of the Pink Anis (Anis alui), will give a fair idea of the size of thousands of bushels we saw on the trees in Kazan. In size and weight it does not differ materially from our Fameuse; but its rich pink color, with heavy blue bloom, is more attractive to the eye. As to quality Mr. Gibb says: "The flesh is fine, white, firm, and it is really a dessert apple of fine quality." Its season here at Ames, Iowa, is about that of Fameuse. To become a first-class winter apple it must be planted as far north as the north half of Minnesota and Dakota, where we have the best reason for believing it will prove a bonanza. If this fails, when grown on hardy roots, at the far north, the last hope in our day of growing dessert winter apples profitably may be relinquished.

In tree all the varieties of the Anis are half dwarf in the nursery and orchard. When three years old in the nursery the Anis is a pretty round-topped bush rather than a tree. It comes into bearing when the tree is very small, and in orchard the trees will not crowd each other in 20 years if planted 16 feet apart, each way. While it seems to hold perfect foliage, and to be free from blight when grown south of its natural limits, these notes are specially written to attract the attention of northern planters when even the Wealthy has recently failed to stand the test Winters.

It may prove useful to Northern readers of the RURAL to add that numbers 317, 372, and 987, of the Department list of cions imported in 1870, as fruited at Ames, are true varieties of the Anis. They are finely colored fruits, yet one is named White Pigeon, another Russian Green, and the last Yellow Anis. Possibly these absurd mistakes originated with Dr. Regel, who, at that time, was a better botanist than pomologist; but it is more probable that the cions and names were mixed by Department clerks at Washington. While the nomenclature of Russian fruits is faulty, yet this general remark does not apply to noted commercial varieties grown by the million bushels for use in the large cities, such as Anis and Antonovka. We have propagated but few trees of the Anis which have been sent mainly to the North, hence the extended trial of the family will depend on the importation of cions by northern propagators.

Ag. College, Ames, Iowa.

THE ROBINSON PLUM.

LESS than a week ago we received from Messrs. Albertson & Hobbs, Bridgeport, Ind., a box of Robinson Plums, taken from trees set out four years ago when very small. The above firm say: "They were planted 12 feet each way, and now average eight to ten feet in hight and nearly ten feet in spread of top. Every tree in the orchard of over 100 trees is loaded with a very heavy crop of fruit, bending the limbs almost to the ground, every tree being supported by five to twenty props, to keep the fruit from breaking the branches. This extremely heavy crop has caused the plums to be a little under size. The trees where not propped are in many instances breaking. It is hardly likely the Wild Goose would be much, if any, larger if loaded nearly so full. We think there is much less astringency in this than in the Wild Goose or any other of the Chickasaw family that we have tested. For this reason it is much preferred by the women for jellies, preserves, or canning. Where the finer plums or gages, etc., do not succeed, this will be welcomed. The trees this season are all loaded, regardless of any care or protection from curculio. We believe this plum to be more nearly free from the curculio than any yet introduced. The trees in this orchard planted four years ago are now bearing their third crop, having also borne a full crop the second year after planting.

The large green cluster we send is, we think, a Lombard. Did you ever see a load to beat it—18 large, fine plums on about six inches? This was taken from one of three trees in the back-yard, from 12 to 15 feet high, and spreading almost to breaking with their heavy load of fruit, having to be propped up. There were four to six bushels of perfect plums on them, without the slightest care or protection against the curculio.

REMARKS: The Robinson Plums average 1¼ inch in diameter. The flesh is tender, sweet and juicy, the skin papery and bitter. The flesh immediately about the pits is sour. As to the Lombard, we have never before seen plums crowded upon the same length of stem (seven inches) that would weigh as much. There were 18 plums, weighing one pound two ounces. The Lombard originated in N. Y. The color is purplish, with a light purplish bloom. The flesh is yellow and juicy, but not of the first quality. It clings to the stone. This plum ripens in this climate in late August. The tree is a strong grower and wonderfully productive. It is a profitable market sort, Mr. P. Barry says, and succeeds first-rate in Vermont, New York, Michigan, Penn., Ohio, Kentucky, Colorado, and moderately well in many other States, notably Ark., Miss., La., Cal., Ks., Neb., Mo., Ills., Md., Minn., Wis., Ont., R. I., Conn., N. S., Me., Mass.

Farm Topics.

CORRESPONDENTS' VIEWS.

WE have in mind the kind of paper needed in these parts. It should be anti-whiskey, anti-political, anti-big-sugar-farm and anti-white-man-sit-on-fence-smoking-pipe-and-watching-nigger-hoe-cotton. That's as near as I can put it. W. W. G.

Baton Rouge, La.

Too many people talk about their successes and have too little to say about their failures. It is a great blow about the former and perfect silence about the latter, that make a fair average, they think. There is more to be gained in discussing a failure then there is in magnifying a success. D. B. S.

OUR Hereford bull on the college farm makes a good policeman. We had him at the Nebraska State Fair. One hot day, small holes were cut in front of cattle in the stock stables to give them air. This bull by getting a horn in this hole broke off a board. A negro came along looking for a place to "sly" in. He saw this broken board. Just as he got ready to crawl in, he saw the big white face looking up at him, and he went back like a shot. He stood for a while thinking whether the pleasure of the show would compensate him for the risk he would run in passing those horns. He gave it up and went on.

Lincoln, Neb. L. E. B.

I HAVE been poisoned by Poison Ivy and have cured myself easily. Take lime, slake it as for white-wash, and rub the parts affected two or three times. This is a sure cure. A. J.

Lincoln Park, N. J.

SPREADING MANURE.

IN regard to the question submitted to RURAL readers on page 493, I would say: The manure spread in February acted primarily as a mulch; frost came out slowly, leaving the soil open and porous, and the covering prevented heavy rains from beating it down and packing it. All the active constituents of the manure were leached down through the pores to the sub-soil, where their chemical action set free valuable plant-feeding elements lying there inert, and these were quickly appropriated by the roots of the plants, and caused the luxuriant growth. On the other side of the field, frost came out of the soil rapidly, leaving it in a semi-liquid condition. Rains packed it solid and closed the pores, effectually preventing such of the active constituents of the manure as remained in it when applied, from leaching down to the sub-soil and acting as in the other case. These constituents remained near the surface, and were, to a great extent, dissipated by sun and wind. Nature, through the agency of frost, opens the soil for the reception of the active elements of manure. If the manure is on the land when the pores are open, and the soil is in a receptive condition, we obtain the full benefit of it.

We can, in a small measure, imitate Nature by plowing the manure in, but no such results are obtained as when it is absorbed through the pores of the soil by Nature's own processes. Manure spread upon the soil when its pores are closed, is, to a considerable extent, wasted. Its active chemical constituents are dissipated by the action of sun and air, which at that time are very powerful, and only the humus remains. FRED GRUNDY.

Morrisonville, Ill.

WHEN TO SPREAD MANURE.

THE RURAL'S inquiry as to spreading manure reminds me of an experience of mine 12 years ago on land in Alabama. The lower part of a 20-acre hillside field was planted to corn; the upper part was put in cow peas. In our manner of planting corn, one stalk to the hill, Crab Grass always comes in and fills the ground after "laying by." The corn was cut, and the whole field plowed, turning under the grass and peas. Wheat was sowed. The part that had been in corn produced twice as much wheat as the other part. Three years afterwards the ground was sown in wheat again with the same results. The difference in the yields was noticeable up to the very line between the two sections. In the Spring of '72 I planted an acre of cotton on land so poor that it would not produce anything without manure—one shovelful of a compost consisting of stable manure, cotton seed, and red clay from a well, was put in each hill. The seed failed to grow. The acre lay and grew a heavy crop of grass. The balance of the field being in cotton and corn, also ran to grass. I turned this under, and since that time the land has produced fine crops without any more manure. It ruins clay land to work it too wet. Twelve years ago we started plowing a piece of heavy clay just after a shower. We had to give it up, but the part that was plowed has been poor ever since, in spite of all the manure that has been put upon it. If I could only get a good stand of some green crop to turn under I think it would be all right. [Can't you drain it?—EDS.] J. M. M.

Green Cove, Fla.

MANURE IN THE WEST.

I HAVE just had a letter from a man who left our town and went out West. He bought a farm that had just about starved the last man to own it. Wheat, and but little of that, had been raised on it. The man I speak of found a great pile of manure, almost as large as a house, in the barnyard. It had never been carted out. He began at it and spent the best part of a month hauling that manure out on to the land. The neighbors all laughed at him at first. At last they came and said they would haul their own manure out on his land if he would only say the word. They hated to see a man suffering for manure. So he had about all the manure in the neighborhood dumped on his farm. He raised a crop of wheat that beat anything ever seen out in that country. People who gave him manure then are like misers over it now. They see that when prices go down the point is to raise a bigger crop on the same or on a less area of land, and get their profit in labor saved. There is only one thing that will do the work, and that is manure. H. B.

Bergen Co., N. J.

NOW SOW RYE FOR GREEN MANURE.

ON nearly every farm and garden there are beginning to be vacant places growing up to weeds where the crops have been gathered. It is too late to sow turnips, but if wanted for nothing else, such places may now be sown to winter rye. This will keep down weeds, prevent washing, and furnish a heavy growth of green manure in time for next season's crops.

The best crop of musk-melons I ever grew had no other manure than two feet of green rye plowed under. The best patch of early cabbages I have seen this season has just been marketed from land where a heavy growth of rye was turned in May, as it was beginning to head. Rye is to the gardener what clover is to the farmer. It is nearly equal to clover as a manure plant, and is specially adapted to the needs of the gardener, as it can be grown in months when the land is otherwise idle. It may be sown at almost any time when the land can be worked, but is sometimes uncertain if sown too late in the Fall. I once sowed a piece on heavy soil, on November 7, and a long cold rain coming on, it nearly all rotted, though the seed was grown the same season. But whenever weeds will grow, rye will. Keep the land doing something. It loses its fertility faster when lying naked than when growing the most exhaustive crop. Weeds are better than nothing, but rye is better than weeds.

Kent Co., Mich. A. A. CROZIER.

RYE A POOR GREEN MANURE.

I SHALL have to give my vote on rye as a green manure with A. C. G., page 479. I have plowed under heavy crops of it at various times but never could see much benefit from it. We need something besides bulk to improve our soils. I fail to see why green manures may not differ as widely as do other manures. V. H. J.

Orange Co., N. Y.

Farm Economy.

SAVE AT HOME FIRST.

I AM satisfied that the best manure the farmer can secure is what he can make and save on the farm, provided, of course, that proper pains are taken in the making and saving to secure all the valuable properties. You can save and apply manure made on the farm and receive but a very small amount of benefit; while, again, a very large amount of benefit can be derived in a short time if the work is properly done. In order to get all th

benefit from stable manure, it must first be saved in the proper manner and then be applied so that the growing crops can derive the largest amount of benefit therefrom. I have tried commercial manure, and while a considerable benefit can be derived—and that, too, in a short time and with very little labor in applying—yet the benefit is only for a short time.

Liquid manure can be applied, but the benefit lasts generally only for one season, while a good application of well rotted stable manure, that has been saved so that all the valuable properties are retained, thoroughly incorporated with the soil after it has been plowed or spaded up, will confer a benefit for a number of years.

While in some cases it may be advisable to purchase and use commercial fertilizers, and such can be used very profitably, yet it is important to impress upon the farmer that every means should be first taken to save all that can possibly be secured on the farm. This is the most valuable manure, and until one has secured and applied all this I consider it unnecessary to purchase anything else.

Miller Co., Mo. N. J. SHEPHERD.

HUSKING-JACK.

JAMES R. ADAMS, of Wayne Co., N. Y., sends us the design for the excellent husking-jack shown at Fig. 329. He has used it five

Fig. 329.

seasons, and likes it well. It seems to us like an excellent implement, although we have not used it. Our illustrations show how it is made better than we can describe it. To use it, place it beside the shock, as shown at Fig. 329. Pull the shock over into the middle. Two good seats are thus left. When the shock is partially finished, let each man take hold of the side-arms and raise them to the position shown at Fig. 330. The weight of the men

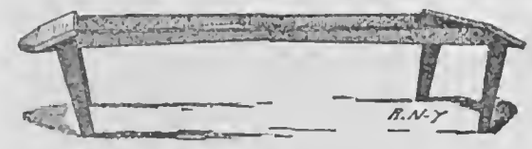


Fig. 330.

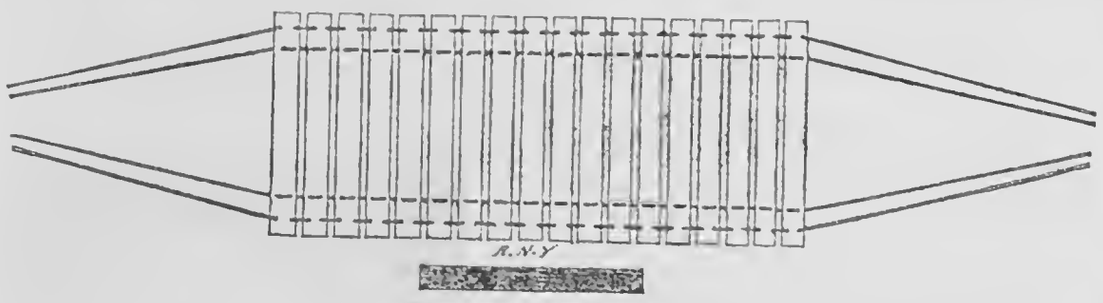
will hold the jack in position. When the shock is all husked, tip the jack over and carry to the next shock. It works just as well on the barn floor, and one man can handle it. Dimensions: width, 30 inches; hight of seats, 18 inches; length of side-arms, 33 inches. The jack should be put together with bolts, and the legs braced with iron braces. Persons who find it uncomfortable to kneel or sit on the damp ground, will be greatly pleased with this jack.

A CHEAP HAMMOCK.

THE hammock shown at Fig. 328 is cheap, easily made and exceedingly comfortable.



A CHEAP HAMMOCK. Fig. 328.

There should be at least one hammock on every farm. Swung under the trees or in other shady places, they form very centers of comfort. The one shown in our picture is made of old barrel staves, strung upon ropes which pass through holes near the ends of the staves, the staves being placed several inches apart or close together, as desired. One rope or two, with one or two sets of holes, may be used. When but one rope is used, the holes are liable to split. A soft blanket or mattress placed on the staves, renders this hammock exceedingly comfortable.

Architecture.

BUILDING BARNS.

CAN THEY BE TOO WARM?

THE RURAL'S good friend, R. E. D., Tioga, Pa., is going to build a barn, and proposes to first side it with second-quality lumber, putting boards on the roof. Then cover the whole with building paper and over this put first-quality matched lumber for sides, and good shingles for roof; but his carpenter and the neighbors are fearful he will overdo the "warmth business," and that his hay will not keep in such a tight place, and he asks advice.

R. E. D's plans are first-class, and if he carries them out to completion he will have a superior barn, and if I were to suggest any change it would be to match the inside boarding as well as the outside. So long as proper ventilation is provided for, a barn cannot be too warm. The sole object in housing stock is to keep them warm. The temperature of their bodies must be kept at blood heat (98°), or they will soon become diseased, and as the only way nature has provided for doing this is by the combustion of a portion of their food in their breathing apparatus, and this consumption will be in proportion to the exposure, it follows that when in warm quarters much less food will be used in this way, and the surplus will go to the increase of body or the production of milk, meat or wool. Any man who provides for any stock, quarters in which frost is ever seen, is simply wasting a portion of the hay and grain given, and if he has "brains enough to think," must know that lumber and building paper are much cheaper than hay or grain. I keep thermometers hanging in every part of my barns, and when I find any of my thermometers below 55°, I begin to look about to see where the heat gets out and the cold gets in. Cold is like a "thief in the night," and soon steals away all the profits of wintering any class of stock, and the wise stockman will as jealously exclude the cold as he would the thief.

The other notion—that hay will not keep in tight mows—is equally absurd. There is only one real agent of decay, oxygen, and if we exclude that we prevent all injury to our hay. Moisture assists the union of the oxygen with the starch, sugar and woody fiber of the hay, and when we cure the grass sufficiently to drive off the most of this we can put it into stacks or have it anywhere exposed to the air and it will take no harm. If, on the other hand, we had receptacles entirely air-tight, we could put the grass when first cut and full of juice into them, and by treading it down solid, and then excluding the air could keep it any length of time in good condition. This is what is done to a certain degree in the silo, and this is what should be done as much as possible in our barns. When single-boarded, and with cracks between the boards, air is as freely admitted as though the hay was in stack, and if put up with much moisture, whether in juice or external wet, the oxygen attacks the carbohydrates, and this generates heat, and this only increases the rapidity of action of the oxygen while the current of air all around drives heat and moisture towards the center. The result is that a large proportion is nearly or quite ruined. When the barns are made as tight as possible and are kept tightly closed, but little air can gain access, and consequently but little oxygen reaches the hay, while what little heat is generated rises gradually and evenly through the mow and the hay slowly dries out with no injury. The fact is, the tighter the barns, the less danger of injury, and the greener the hay can be put in, the better the quality in Winter or Spring.

It is an old-fogy notion that barns can be made too warm or tight, and the sooner farmers are educated above it the better.

J. S. WOODWARD.

The Herdsman.

RELIEVING CHOKING COWS.

TO-DAY a valuable Ayrshire heifer got a small turnip down her throat and could move it neither up nor down. After working some time, but failing to remove it, I procured the appliance shown at Figs. 332 and 333, and re-

Fig. 332.

moved it in a very few moments, and the heifer is all right and doing nicely.

The appliance consists of a piece of heavy 1¼-inch rubber steam pipe or hose, about six feet long, with a wooden pusher fastened in each end. See Fig. 332. This wooden pusher is about 4½ inches long and projects beyond the hose about 2½ inches, tapering up to 1¾ inch at one end and 1½ inch at the other, turned out concave or hollow at the large end. There is also a jaw-holder made of one-

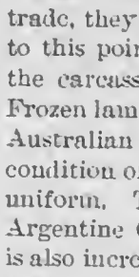


Fig. 333.

half-inch iron rod with a wooden handle attached, shown at Fig. 333.

When a cow is choked, place her under jaw in the opening at *b*, and her nose at *a*. This will hold her mouth open and give you a chance to work the rubber pipe through the hole, *c*. Let one or two men hold the jaw-holder and her head firmly, while some one puts the rubber pipe with the wooden pusher down her throat through the hole, *c*, until it reaches the obstruction; another man places his hand on her throat and guides the pusher, so it will not slip by the obstruction, which is pushed down into the stomach.

The jaw-holder is 5½ inches across by 12 inches high; the oblong hole, *c*, for the pusher is 4¼x3¼ inches. This home-made device may be an old one, but I have never seen one like it before. The pipe is quite limber, but stiff enough to do all the pushing necessary.

Oneida, N. Y. E. B. B.

BROWN SWISS CATTLE.

WE claim that the Brown Swiss Cattle cannot be excelled for hardiness and for combined milk and beef qualities. They have been bred for generations in a mountain region, and inured to cold and storm to a remarkable degree. They have never been injured by "fancy feeding." Imported animals refuse to eat grain when first brought to America. They have been carefully bred for years for milk qualities in a country remarkable for its dairy goods. They cannot be beaten for beef. Calves are larger and stronger than those of any other breed I have seen. They grow well. This breed is worthy of general attention.

Washington Co., N. Y. J. B. ELDREDGE.

Sheep Husbandry.

ENGLAND'S FOREIGN MUTTON SUPPLY.

NEW ZEALAND has virtually the foreign mutton trade of England in its hands. During the past year 778,000 head of frozen New Zealand sheep were landed in London, while only 603,000 native sheep were penned there. When the trade commenced, two or three years ago, the mutton was considerably better than it is now. The meat used to be full of flesh; now it is often too full of fat. If New Zealand shippers are anxious to preserve the trade, they are warned to pay more attention to this point, as a large proportion of fat in the carcass is unprofitable to the consumer. Frozen lamb and even kidneys find ready sale. Australian mutton is less esteemed, and the condition of the shipments has been far from uniform. The frozen mutton trade of the Argentine Confederation and Bonda Oriental is also increasing, as the enormous flocks there are being graded up. Until lately sheep were raised there almost exclusively for wool, pelt and tallow. Whenever sheep go up in England, large importations from North Germany, Holland and the Netherlands soon knock down prices. The meat supply of the United Kingdom last year was 1,825,000 tons, or 112 pounds to each inhabitant; the home produce amounted to 74.6 per cent. of the whole; the United States supplied 16. per cent; Europe 5.3 per cent; the colonies, 3.7 per cent. and South America .4 per cent.

FEEDING LAMBS.

IN feeding lambs in cold weather a bottle or a flat flask is a handy tool. We find no trouble in thus feeding hungry lambs. If we let them stay at the sheep barn and tug away at their mothers, whether they get enough or not they soon become a nuisance when taken to the house. When left with the sheep they learn to eat hay and other foods in a short time. I put a quill through the cork of the bottle, and then attach an ordinary gun nipple. The nipple must be tied to the cork to prevent the lambs from pulling it away. My little daughter feeds lambs with this arrangement successfully. N. H.

Goshen, Pa.

Dairy Husbandry.

COST OF MILK.

SOME time since the RURAL mentioned the fact that we had produced milk at 1½ cent per quart. I am asked to give the kind, quantity, proportions and prices of feeds needed to produce such milk. I give them below:—

In March, 1884, three cows which had been in milk about five months, and whose average weight was 1,192 pounds, were selected for the purpose of ascertaining the quantity and value of their solid and liquid droppings. In order to have normal conditions the food used was the same in quantity and quality as had been fed during the Winter. As everything consumed and produced by the cows was weighed, it was an easy matter to get at the food cost of a quart of milk. The food consumed in three days and its market value in the barn at the time are set forth below:—

125 lb clover hay at $8.00 per ton	$ 49
41 lb corn stalks at $4.00 per ton	08
45 lb cotton-seed meal at $26.00 per ton	59
42 lb corn meal at $26.00 per ton	55
42 lb malt sprouts at $14.00 per ton	29
	$2.00

Yield of milk of three cows, three days, 285 pounds—133.5 quarts, at 1½ cent, $2.00. The cows were fed and watered twice daily. The hay was fed dry, the corn-stalks were cut, damped and mixed with cotton-seed meal, corn and sprouts in the afternoon of the day preceding that on which they were fed. Of necessity, the cows were allowed no exercise in the covered yard, and their yield of milk was 8½ pounds less than on the three days preceding those of the experiment. The food of each cow cost, per day, 22 2-9 cents. The manure of each cow per day, at commercial values at the time, computed according to Wolff's tables, was worth 16⅞ cents.

I. P. ROBERTS.

Cornell University, Ithica, N. Y.

A GOOD JERSEY GRADE.

IN the hunt for the "general-purpose cow," never overlook the Jersey grade. I have a half-blood Jersey six years old, fourth calf, fresh April 12. She was sired by the Jersey bull "Buckeye." I gave her a fair test. She had for feed fair pasture, nine pounds of bran daily, five weeks previous to and during the test, also six pounds of corn meal three days before and during the test. Her record was as follows:

Tuesday, May	25th,	milk,	39	pounds,	9	ounces.
Wednesday, "	26th,	"	39	"	4	"
Thursday, "	27th,	"	43	"	6	"
Friday, "	28th,	"	37	"	1	"
Saturday, "	29th,	"	40	"	11	"
Sunday, "	30th,	"	38	"	4	"
Monday, "	31st,	"	38	"	6	"
Total milk for 7 days:			276	pounds	9	ounces.
Average milk daily,			39	"	8	"
Butter churned from above,			15	"	3	"

You can see that this feed was not "forced." The milk was rich enough for anybody. Where do you go to find a butter machine of this capacity so cheap? P. O'C.

Youngstown, Ohio.

The Swineherd.

SELECTING THE BREED OF SWINE.

THERE is no better time than during the summer growth of swine, or during the annual fairs, for the intending beginner to select a breed to adhere to. It may not be to his interest to grow very large swine; but it certainly is to every man's interest, not only to select a breed, but the specimens of a breed that will grow to a fair marketable size at an early age. The color, as in cattle, is mainly a matter of fancy, for, while it may not be denied that some swine are liable to ailments of the skin, that do not commonly affect others having the hair and outer coating of the skin differently colored, yet the color cuts no figure in fixing the fattening tendency or in determining the quality of the flesh. By examining different herds of breeding swine, and the offshoots of those that are being fed for markets, the latter on some farms being made up of the leavings—such as did not meet the demands for breeding purposes—as these are upon grass, depending mainly upon this for sustenance, one can make a better estimate of the value of a given herd, as "self-tenders," than where they are kept up in close quarters and fed on rich food prepared from grains, oil cake meal, etc.

Then again, it is an aid of no mean importance in making selections, to be able to look over a lot of brood sows having their litters with them, as in this way we are enabled to see what the tendencies are in breeding; that is, whether they are inclined to bring good litters as to numbers, and good also in the matters of growth, form, and tendency to fatten promptly. If one will keep an eye out for pointers that will aid him, he will get these by observing a not unusual sight—namely: that a portion of the sows so fine-looking themselves, are followed by one or two good pigs, another not so good, and a puny runt. These are some of the advantages secured by visiting herds in the Summer, as one can then most easily trace family characteristics, in the matter of prolificness, not only of the older sows, but of the offshoots of those that have been put to breeding. There is a natural tendency to variation in all kinds of domestic animals, and swine stock coming into breeding so early and maturing so rapidly, it is not unreasonable to expect strik-

ing variations. Hence, if we can find within a given herd, a family line more uniform in important features than other family lines in the collection, reasonably prolific as breeders, good growers and shapely in form, these are the families out of which we should select, getting our male from a different, and if necessary, distant herd. "WESTERN."

The Poultry Yard.

PRESERVATION OF POULTRY MANURE.

POULTRY droppings very quickly lose their value if not carefully preserved. If the coops were cleaned daily, instead of occasionally, the gain in the value of the manure would compensate for so doing more, as the droppings contain a larger proportion of valuable matter that readily escapes than many suppose. It has been recommended to compost the droppings with dry earth; but dry earth, though an absorbent, does not wholly preserve them. Nor will plaster answer fully for that purpose. The best dry absorbent is kainit, and as it is of itself an excellent fertilizer the cost need not be considered.

It is well known that water absorbs many times its volume of ammonia, and that it quickly causes all substances in the shape of manure to decompose and change their forms and conditions. If, then, instead of keeping the droppings perfectly dry, we keep them moist with soap-suds, we not only cause them to decompose (which is really desirable), but the water absorbs and arrests the ammonia, and prevents its escape. The soap-suds combine, also, with the manure, first forming fat acids, which in turn react on the insoluble matter of the manure, and render it more available as plant food. It is not suggested to keep the droppings *wet*, but only *moist*. They may be mixed with dry earth, if preferred, with a small quantity of kainit added, the whole to be saturated with strong soap-suds, and kept moist afterwards, using additional suds as the heap increases. For this purpose a large bin or box should be provided, or barrels may be used, but under cover as a protection against rain and sun. Poultry manure and night-soil, though very rich in nitrogen, lose by exposure, and when allowed to become dry the loss is quite an item. Analysis shows this to be the case with night-soil, which seldom compares favorably with animal manure, although it is known to be produced from food that is really more nutritious than that fed to animals. If it could be preserved daily, in a fresh condition, so as to absorb and retain the liquids and volatile matter, it would give better results. The same applies to poultry droppings. If allowed to become dry under the roost, they decrease in value, but if preserved in a fresh condition much of the nutritious matter will be saved. If those who desire to save the droppings will try the method suggested, keeping them moist with strong soap-suds, the ammoniacal odor which will greet their olfactories when about to apply the manure to land will be convincing. P. H. JACOBS.

WHITE LEGHORNS.

WE have had, first and last, a good deal of experience with White Leghorns. They are the favorite breed among the farmers of Bergen Co., New Jersey—not for the table or market, but for their large, white eggs, which find a ready sale in the chief cities and towns. No other breed of its size lays so large an egg. Of course the color of the shell would be an objection in some markets where the brown shell is preferred or demanded. Eight eggs will, on the average, weigh a pound. Leghorns are generally non-sitters; still there are many strains that show the proclivity though they can not be relied upon. Our illustration (Fig. 327) is re-engraved from the London Fancier's Gazette. Our experience teaches us that the White Leghorns will not bear confinement as well as Light Brahmas, Cochins, Plymouth Rocks, or Wyandottes, and that they will not lay as well in the Winter.

WATER PAIL FOR POULTRY.

MR. H. GRIFFIN, of New London Co., Conn., uses the arrangement shown at Fig. 331 for watering his poultry. A common pail is used. Holes six inches wide are cut like those shown in the illustration, down to the upper hoop. The cover is made of half-inch white wood with cross-pieces of some hard wood screwed

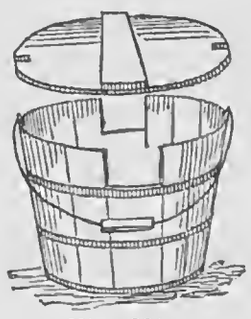

Fig. 331.

on to prevent splitting. Small pieces cut in the cover pass it over the bail. The hens can drink from this without getting dirt into the water and without tipping the vessel over.

A POULTRY FRAUD.

WHAT constitutes a fraud in the poultry business? I ordered a setting of eggs from a well advertised dealer, put them under a good hen and hatched three chickens. Now only one of the three even slightly resembles the breed I thought I was buying. The only redress I can obtain from the dealer is an offer to sell me more eggs at a reduced rate. If such practice is common, I must lose respect for hen men.

Licking Co., Ohio. G. C.

WHITE PLYMOUTH ROCKS AND WYANDOTTES.—I think the White Plymouth Rocks are the coming breed. They are snow-white, with yellow skin, bill and legs, and single, erect combs. The White Wyandottes are hard to breed true to color. Dark colors are almost sure to show. I do not notice this so much in White Plymouth Rocks. H. W.

Coxsackie, N. Y.

[It is much to be regretted that so much importance is attached to color and markings. It is all right in its way—but we shall never increase the size or number of eggs by such breeding.—EDS.]

WHITE LEGHORNS. Re-engraved from the London Fanciers' Gazette. Fig. 327.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

AMERICAN APPLES IN EUROPE.—CIRCULAR FROM DELONG, MAYER & CO., NEW YORK.—It is expected that the English apple crop will be very small this year, and that consequently a profitable market will be found for many of our apples abroad. Last year in the nine months between August, '85, and May, '86, 862,000 barrels of apples were shipped to England. Prices were not entirely satisfactory, however, and many were disappointed. This year, in consequence of the reported failure of the English crop, it is expected that prices will be more satisfactory. Messrs. DeLong, Mayer & Co., of this city, are the principal apple shippers. Their circular of instructions, recently issued, contains many useful suggestions. The most important point is the packing. Only new barrels should be used, and the filling should be done on a platform of boards and not on the ground. No wormy or bruised fruit should ever be used. Fine, uniform apples should be placed in the first layer with the stems down. The bottom becomes the head when the barrel is filled. After the first layer, the fruit may be poured in from baskets, care being taken not to bruise it. Place enough on top to project half the thickness of an apple above the top of the chime of the barrel. Place the top on these apples, and with a screw-press gently force it into the barrel. Mark on the head of the barrel; a plain stencil makes the best mark. Use the brand only on the best parcels. If inferior fruit is to be sent, it is better to vary the mark. A reputation for good fruit may be destroyed if the regular brand is used on inferior sorts Some brands are so well known that the fruit does not even need to be sampled at the sale. Let an inferior lot go to the sale with the brand affixed, and this reputation will surely be lost. The expense of sending a barrel of apples from New York to the market at Liverpool is about $1. To this must be added the freight from the point of packing to New York, and cost of handling in the city. The agents charge five per cent. commission. All good keepers will do to send. Baldwins, Russets, Jonathans, Kings, Greenings, Spitzenburghs, etc., all do well on the trip.

SWINE RAISING IN HUNGARY.—Pamphlet from the State Department.—The swine of Hungary are famous throughout all Europe. Pork is the favorite food with Hungarians, and great pains are taken to prepare it in large quantities of good flavor. The object is to produce a very fat animal, less regard being had to the proportion of lean meat, bones, etc. Pure fat is most highly esteemed. There are two races of Hungarian swine, or really one race with two distinct markings, since the only difference between them lies in the color. Those of one sort are white all over except the foot and snout, which are black, while the others are black all over except the bellies, which are white or yellow. Experiments have been made in attempting to improve or change these breeds by the introduction of foreign-bred animals, but without success. The imported hogs thrive well and appear to be well adapted to the climate, but after a few crossings the progeny lose the imported characteristics and go back to the fixed type of the Hungarian hog. Consul Sterne writing, from Buda-Pesth, sends to the State Department an interesting account of the methods employed in handling hogs for the markets. The pigs are weaned and driven to pasture where they are fed, at times a little barley. Later, they pick up what they can find in the harvested fields. Then they are supplied with beets, pumpkins and second-class corn. About six weeks before the time for fattening, the pigs are gradually put upon better rations to prepare them for the forced feeding of the fattening period. Pigs from 12 to 14 months old, weighing from 110 to 143 pounds, are picked out in Summer, and driven to the fattening establishments. These establishments are located near the cities and close to the markets. But little salt pork is eaten in Hungary, and with the exception of the hams and a little bacon, all the pork is eaten fresh. The largest establishment is located near Buda-Pesth, and will accommodate 125,000 hogs at one time. It is divided into sections which are separated by means of strong fences. A section capable of holding 160 hogs is 60 feet wide by 90 feet deep, thus giving nearly 35 square feet to each hog. One-third of this space is reserved as a resting place, and covered with a low shed. The floor is covered with a layer of two feet of clean sand, which is renewed as often as it becomes earthy or damp. Instinct prompts the hogs to keep this place clean. Animals that ignore the rules of cleanliness are promptly driven out by the others and sometimes offenders are bitten to death. Sand has some advantages over straw for bedding. It has natural cleansing qualities, and cleanliness helps out the price and promotes health and appetite. The floor of the yard outside of the shed is made of brick. This floor is kept clean by sweeping and washing. In one corner a square place is left for a bath. This is large enough for 20 animals at one time. Once a week it is cleaned out and filled with clean water. The feed consists entirely of corn and barley ground and mixed. The food is mixed with cold water in Summer and with warm water in Winter. Once each week the hogs receive common salt. There is always a lump of rock salt hanging up where all can lick it as they like. The amount of food varies from seven to 10 pounds for each animal per day. The hogs are kept in good appetite, the test being the contents of the trough after the meal. A dozen hogs are fed from one 15-foot trough. The fattening period lasts from five to six months. Animals are considered ripe when their shape has become compact, when they stop eating heartily and remain closely in their resting place. They gain, on this mixed corn and barley meal, nearly 20 pounds in weight for every 100 pounds of feed. In experimental feeding much higher gains have been reported. The best gain comes in the earlier part of the feeding. Summer fattening is considered most profitable by far. The diseases most dreaded are erysipelas, a disease somewhat similar to our hog cholera, colic and a sort of distemper. In erysipelas the hogs receive cold baths, and crystallized carbolic acid is added to their drinking water. This, with a change of pasture, proves a very satisfactory treatment. There appears to be no profitable treatment for cholera, prevention by cleanliness being considered the only way of avoiding it. In cases of over-feeding, doses of hydrochloric acid are given, and for indigestion hogs are simply treated to a short spell of starvation. The loss during the fattening period will average about three per cent. The inspection of imported animals is very strict, and Government officials are appointed to oversee the production and handling of the meat. Carbolic acid is the great disinfectant. The production of Hungarian pork is marked by a system and economy that might well be studied in this country. The custom of fattening large herds of hogs near the cities may never come into general practice, as most farmers believe they can manufacture their corn into pork at home most economically. If they do this they might learn from the Hungarians that the hog thinks as much of cleanliness as does any other member of the family. Clean, dry, warm quarters for the hog should always be provided, or no hogs should be kept. A hog should be permitted to bathe and keep itself clean. A good selection of breeds, good food and good care are necessary for profitable swine husbandry in large or small herds, in Hungary as well as in America, for the lessons of one country are good in another.

What Others Say

WHICH WAY SHALL THE ROWS RUN?—Prof. Armsby, of the Wis. Ex. Station, in the Farmer (St. Paul, Minn.) gives an account of an elaborate investigation upon the influence of the direction of the rows upon the warmth and moisture of the soil and the growth of crops, made by Prof. Marek, of Koenigsberg It was found, when the rows, ridges or beds had a north and south direction, the soil was decidedly warmer and drier during the day than when the east or west direction was followed. This difference was greatest with ridge culture, and least with level culture. The higher the ridges the greater the difference. As was to be expected, the ridges became warmest and driest while the furrows were least affected. The effect was the greatest during the hottest months and days. On the other hand, the soil which became warmest during the day cooled off most rapidly during the night, so that in the early morning hours, hardly any difference in the temperature of the soil was observable in the two cases. The observations upon the growth of crops were made chiefly with sugar beets. It was found that the greater moisture and coolness of the rows running east and west were most favorable for the young plants. Later in the season, however, the plants in the north and south rows overtook those in the east and west rows. At the time of harvest,

the east and west rows were found to have produced the greatest average weight of leaves per plant, while the north and south rows produced the heavier roots, and roots of a better quality for sugar making, the percentage of sugar being greater and the amount of impurities less. The experiments with other crops were less extensive and gave less decisive results. One with corn indicated that for the production of fodder an east and west direction was to be preferred. Obviously, however, the practical application of these results would require good judgment. On a soil inclined to be dry, for example, or with a crop which flourishes best in a moist soil and moderate temperature, the east and west direction might be preferable. On the other hand, the ripening process for grain and fruit, and the development of seed rather than stalks or leaves, might be favored by a north and south direction of the rows, especially upon moist land.

WORKING TEN HOURS ON THE FARM.—"If you should call on us aboutseven o'clock some evening this Summer, and see our young men all dressed up, you would hardly think we were farmers who had been at work in the dirt all day, perhaps. If you suspected from the color of our hands and faces that we were farmers, you would certainly think that we were 'expecting company.' Our boys visit the bath-room after work is done and sleek themselves up, often putting on clean clothes entirely, and then go in for a good time until nine or 10 o'clock." So writes Mr. T. B. Terry to the Albany Cultivator. He insists that farmers may be just as neat and tidy, when the day's work is over, as though they lived in town or city.

On a dairy farm one cannot make the ten-hour system work as well, on account of the milking. The morning milking must be done outside of the 10 hours; but all work may be closed up at night soon after six, usually, unless one has to go to the factory.

Mr. Terry's men have only to feed and care for the horses and milk the cows before breakfast, at 6:30, so as to begin work at seven. They often get a little time to sit down and read the papers or magazines, a good supply of which is taken, and at night they can have three hours to read if they wish.

Of course, on every farm there will be times when we have to work a little later than six o'clock. One cuts a little too much hay to get through in time, or there are only two or three rows more potatoes to cultivate to finish the piece. But Mr. Terry notices that his men "let out a link" to get through in time if it is possible. If they let out a little too much and get through at 5:30, or even five o'clock, they are not asked to do any more that day, and they know they will not be, so there is encouragement to hurry up. Even granting that those farmers who work from sun to sun do accomplish more, cannot enough be done now-a-days in ten hours? Can we not take a little more time for rest and recreation and reading, now that machinery has made it possible for us to accomplish so much more than our fathers did in the same time. Must we put in as many hours a day as they did when they had to mow and cradle by hand, now that we can mow an acre in 30 minutes, plant an acre of potatoes in two hours, one man and team doing all the work of marking out, dropping and covering, or dig the same ground in about the same time? Let us use machinery so as to make farm life a little more pleasant by having more time for recreation. The time has come when the farmer and his men can be, and should be, more social as well as reading and thinking beings. The reports from the cities, for some time past, must show a thinker that on the farmers largely depends the future welfare of this great country; hence, farmers should be well-balanced and posted men—that they may overbalance the evils of the city and take more hand in the making and executing of our laws.

EDITOR CHEEVER says, in the New England Homestead, that Mr. Isaac A. Carver, of Leeds Center, Me., writes that he has obtained very satisfactory results from crossing Galloway cows with Jersey and Short-horn bulls. Five years ago he began with five Galloway cows, using a Jersey bull for one and a Short-horn for the other four. Last year he patronized a pure-bred polled Angus, and has a fine lot of black polled cattle of various ages, from calves upward. The grade cows have proved very good butter-makers, and Mr. Carver's milk is admitted to be the best that goes to the cheese factory in the vicinity. He is very much pleased with the results of his experiments in breeding grade polled dairy cows.

PROF. JORDAN, of the Maine Experiment Station, makes the following good point in regard to the comparative value of chemical fertilizers:

There is one point in connection with the excess of selling price, to which attention should be called, which is that the same excess of selling price over valuation in two cases does not necessarily mean that one fertilizer is sold as cheaply as the other. This can be illustrated as follows: A's fertilizer is sold for $40 per ton, and values at $32. B's fertilizer sells for $21 per ton, and has a valuation of $16. The excess of selling price is $8 in both cases, but this is only 25 per cent. of the money value of the ingredients in A's fertilizer, while it is 50 per cent. of a similar valuation of B's fertilizer. In other words, B is charging the farmers twice as much as A for handling a given quantity of plant food.

THE RURAL NEW-YORKER ON GAPES.—The editor of the Rural New-Yorker, says the Poultry Keeper, has been at work among a brood of "gaping" chicks, and after experimenting comes to the following conclusion:

It is probably true that the disease known as "gapes" kills more chickens than any other. Most of the remedies offered are uncertain, such, *e. g.*, as obliging the ailing fowls to inhale lime dust and tobacco smoke. Will kerosene kill the worm that causes gapes? Will it kill the chicken if a drop of kerosene be dropped in the trachea? We can answer "no" to the latter question, and from a single experiment we are inclined to say "yes" to the former. The writer dipped a small feather (about two inches long) into kerosene, and then carefully pushed it down the windpipe, carefully turned twice or thrice and then withdrew it. The chicken which had the gapes recovered in a few hours. The experiment is worthy of repetition.

The editor of the Poultry Keeper commenting on the above, says that the remedy is a simple one, and that he has tried it with success, and also used spirits of turpentine with benefit, but the kerosene is the safest material. What is desired is to avoid the use of the feather. To thus handle several hundred chicks is quite a job.

INTEREST ON FARM INVESTMENTS.—Editor A. W. Cheever remarks, in the New England Farmer, that Secretary Gold was right when he stated in a public agricultural meeting that the returns from labor expended are both greater and surer in agriculture than in mining. And Secretary Russell was right, too, when he said, in another agricultural meeting, that a farmer ought to be ashamed of himself if he could not get a bigger interest for his capital than the four per cent. the savings banks are now rather reluctantly paying their depositors. A cow, a hog, a sheep, or even a hen, ought to pay more than four per cent. interest on capital invested, and it will in the hands of any intelligent, willing worker who has faith in his business.

SEVERAL VARIETIES OF OATS AND WHEAT.—Mr. C. S. Plumb, whose dilligent, thorough work at the N. Y. Ex. Station is the kind to do good service to farmers, talks of wheat and oats in a late issue of our respected contemporary the Albany Cultivator. Of the many varieties of the oat that he has tested, none show a weakness of stem equal to the White Australian or Welcome. Of 79 so-called varieties, but few have had serious damage done them, excepting the White Australian, on his plot. It has been, he says, the same all through Western New York, and in 1885, from Geneva to Niagara Falls, extensive fields of this variety were to be seen lying flat on the ground. Admitting that the White Australian Oat has a splendid grain, and is a good cropper, it most certainly cannot be as profitably grown as other varieties, Mr. Plumb says. Any variety whose straw is so weak as not to enable it properly to uphold the head of grain in an average storm, has a very great weakness. Hence he freely condemns the White Australian for a grain variety, though for an early fodder crop for soiling, its soft, succulent stem, and its very foliaceous growth, make it especially desirable. He is aware that this oat is being boomed extensively; yet he insists that an oat crop that has to ripen lying flat on the ground, and be cut with a scythe, cannot be cultivated with profit.

The RURAL NEW-YORKER raised a quarter of an acre of the White Australian before it was introduced. The land was good, the season favorable. We remember that Henry Stewart visited the farm just as it was well headed out. Mr. Stewart is not a tall man certainly, but he could not see over the grain. It promised to yield, he thought, over 100 bushels to the acre. A storm a few days after lodged the most of it. Again we sowed a five-acre field to Russian White, Washington, White Australian, Probsteier and Schœnen, giving equal parts of the field to each. The season was favorable and the Australian stood as well as any. In our plots of the past season, the Welcome (White Australian) stood up as well as any, ripened and yielded as early as any. At the Rural Farm (Long Island, N. Y.) we sowed, last Spring, four acres of Clydesdale. The seed sown weighed plump 40 pounds to the bushel, and the grain harvested was the heaviest we have ever raised, though less than 40 pounds. The plants stood up quite well, though lodged in places. If there is any difference between the Clydesdale and White Australian or Welcome, we can not distinguish it.

Mr. Plumb has raised, this year, what is without doubt the finest collection of oat varieties ever grown at one time in the United States—nearly 80. Among these, he says, the strongest and best growing are the "Horse-mane" or "Side-head" oats. As in past years, they this year resist wind and rain far better than the open-panicled varieties, and certainly experiments thus far have not shown them second-rate yielders. He advocates this type of oat for general farm use, because he believes it the most profitable one a farmer can grow. Mr. P. says that with plenty of manure and good soil, no matter what the variety, so long as it be a "side-head" oat, other things being equal, it will give better results than the open-panicled.

In this we must disagree with Mr. Plumb. All the side oats that we have raised are later than the spreading-panicled oats, and will not do as well, on our land at least, in unfavorable seasons as the latter. Besides, there is more chaff and less kernel. The best yield, it is true, we have ever raised was of the Mold's Black Tartarian, a side oat; but the season was just right. The oats weighed, per bushel, about 26 pounds.

Mr. Plumb considers the question of how much seed wheat should be sown to the acre. They have at the Station four experimental plats of one-twentieth acre each, situated side by side. Alternately they were seeded with an ordinary grain drill, at the rate of one and two bushels per acre. They passed the Winter equally well, and at the time of Mr. Plumb's writing it would have been difficult to say which plats would yield the most. At the Rural Farm we sowed on six plats all the way from half a bushel to four bushels per acre. The plot which received a bushel-and-a-half yielded most.

Mr. Plumb praises the Mediterranean Hybrid (better call it Diehl-Mediterranean) Wheat as a vigorous grower, with very erect habit; head bronze, bearded and very compact, though short; averaging about 2½ inches long; grain plump, short, amber-colored and fairly heavy.

HE says of the Landreth (Armstrong) that it is one of the more recent and best candidates for public favor. Heads white, beardless, having a loose tendency; grain white or slightly amber color, of medium size and plump. This variety has a very erect growth he says; much more so than any other that is at present prominent before the public, excepting Martin's Amber, which it much resembles in almost all respects, and one is about as meritorious as the other.

As we were examining the heads of our Martin's Amber a few weeks ago we were struck with this close resemblance. Are they not the same?

Mr. Plumb says that the Washington Glass "is synonymous with the Surprise, which was sent out in the Seed Distribution of the RURAL NEW-YORKER several years ago. It is a white, beardless wheat of great excellence. The head is compact, and the spikelets produce more grains than the average wheat, often yielding four. The grain is light amber, very large and plump." He is sure more farmers could grow this wheat with profit.

We raised a lot of the Glass Wheat about eight years ago from seed secured from the Ag. Dep. at that time. The heads were of the shape of Clawson or Armstrong, *i. e.*, not larger at the top than at the bottom. The Surprise is partially club-headed with the spikelets crowded towards the top. Again, according to Mr. Wysor, the originator, the Surprise came from the same head as did the Fultzo-Clawson.

FULL AS A TICK.

MANY think favorably of the Lucretia Dewberry, and therefore dissent from the RURAL'S estimate of it. We are glad of it.....

HAVE you occasion to dig up any sods along the roadside, under the fences or in any part of the garden? Save them. Spread a layer of sods and sprinkle on it a light dressing of potash (ashes) and bone; then another layer of sods, then ashes and bone, etc., until the heap is completed. This will give you a perfect soil for flower pots.....

TEN or a dozen young ewes and lambs would be enough for a start on most places, says a writer in the Farm Journal. A good ram should be hired or purchased, and about the first of December, placed with the flock. Do not try for early lambs the first year! May is the safest and *easiest* month, and a very large per cent. of all the lambs will live if the ewes have been running about in the pasture a month, while a large per cent. will die if dropped in February, under ordinary care....

TAKE your children to the fair? Yes, by all means, unless horse-racing and lager beer selling, etc., are allowed. If so, keep them at home, and stay at home with them.....

MUCH is said at present about using the roller on land which is being fitted for wheat. The roller is good to pulverize and firm the soil. But *harrow after rolling.* That is our experience.....

SLUG-SHOT is recommended by one of our esteemed contemporaries as sure death to the cabbage-worm. It may be, but is it safe? Its killing property is arsenic in one form or another.....

THE Japan Chestnut. Don't forget it, friends, in the Fall. We have been talking with many who have been raising seedlings since our late pressing advocacy of this tree, and have nothing to take back. The Japan Chestnut, or the best varieties of it, will have its day—a near day and a long one, unless we are greatly off the track. Our contemporaries will come in line after a time.....

THE N. Y. Times says that pasturing cows has been found a wasteful practice, and will soon be abandoned for a better way. "What would be thought if we were to walk over our bread and butter?" said Sydney Smith, speaking of cows grazing in pastures. "The cow's tread, unlike that of the sheep, does not turn the land to gold, but often destroys an immense amount of fine pasture." Sydney Smith took a very reasonable way of looking at the unclean and wasteful practice, and many a farmer will confess that pasturing cows ought to be obsolete as being the reverse of economical.....

PROF. GOESSMANN, of the Massachusetts Agricultural Experimental Station, says that as long as the vital energy of an annual plant is still essentially spent in the increase of its size, as a rule, but a comparatively small amount of valuable organic compounds, as starch, sugar, etc., accumulates within its cellular tissue.....

THE amount of vegetable matter in a given weight of green fodder corn, cut at the beginning of the glazing of the kernel, is known to be not only nearly twice as large as compared with that contained in an equal weight of green corn fodder cut when just showing the tassels; it is known to be pound for pound more nutritious, for it contains more starch, more sugar, more of valuable nitrogenous matter, etc.....

IN the Orchard and Garden, Mr. D. B Wier mentions the American chestnut as an example of an individual tree ripening and shedding all its pollen six to fourteen days before there are any stigmas on the tree mature enough to receive it. Young, isolated trees, as a rule, he says, do not become fertilized therefore, but bear great crops of burrs without nuts in them. According to the past season's observations of the writer upon a few trees, the earliest catkins do bloom before the stigmas of the cone-like female flowers seem to be receptive, while the later ones bloom and shed their pollen at the same time. We know of single trees far away from others that bear full crops.....

DR. HOSKINS thinks that one of the strangest of the many strange trade conditions of this country is the importation of potatoes. We have a duty of 15 cents a bushel, or at present prices in New York, 32 per cent *ad valorem*, yet this does not prevent the importation of an average of about $4,000,000 worth every year. England, Germany, Bermuda and Nova Scotia are sending potatoes into this country every day, and at the same time our farmers cannot get a remunerative price for this product. What is the cause? The same cause that is deciding many other agricultural problems in this country against the agriculturist—internal transportation. It costs more to take a bushel of potatoes by rail from Albany to New York, than from Liverpool to New York by steamer.....

GALVANIZED barb wire, which costs five cents a pound (75 cents will buy 220 feet), is acknowledged by all scientists to be a very good conductor of electricity. Double the wire and twist into a cable, which will make it four-ply, or four strands. Put one end in the well, cistern or moist earth, and carry the other up over your buildings and along the gables, passing over the chimney or highest points of the building. Fasten to the woodwork with common fence staples. The electricity will not leave as good a conductor as galvanized wire to follow dry lumber. Thus you have the best lightning rod that can be made for less than $1.00, all told. So says the Vermont Watchman.....

DR. MARCKER is quoted by Prof. Johnson as saying that since by the absorption in the soil all potash salts pass into combination with silica, it is of no consequence as far as supplying a deficiency of potash is concerned, whether muriate or sulphate is used. Frequently, therefore, the cheapest form of potash is the best .....

DR. MARCKER also says that there is no reason to believe that the potash salts containing chlorine are injurious to vegetation; on the contrary, the muriate is often to be preferred because its potash is more thoroughly diffused in the soil. He excepts, however, potatoes and sugar beets, since their starch or sugar production is decreased by muriates. Tobacco is also injured by muriate of potash. Low-grade salts, Dr. Marcker says, or the

muriate if used, should be applied upon potato land as early as possible, at the latest in December. If the potash must be applied near planting time, only sulphate should be used. In some cases he found that potash lessened the starch and the starch diminished as the potash was applied nearer planting time.....

PROF. S. W. JOHNSON says that the best time for manuring with muriate of potash depends chiefly on the quality of the soil. For heavy soils manuring in Autumn and Winter is to be recommended; while for light and sandy soils, early Spring is the most suitable time. For meadows and all kinds of land liable to be flooded, manuring in the Spring is best.....

THE best method for employing muriate of potash for field or garden cultivation is to strew it by hand, broadcast, on the unplowed field or the rough furrow. To place the muriate near the seed in drills or hills is not advisable. It is better to mix it with an equal or double quantity of dry earth.....

THE quantity required for potash manuring is, of course, dependent on the chemical condition of the soil and also the amount of potash the crop requires. It may be taken as a general rule that 250 to 450 pounds of 80 per cent. muriate of potash for one acre are necessary.....

SUPPOSE farmers should form a society and strike for fewer hours of labor and higher prices for their products, says Mr. Biggle in the Farm Journal. Suppose the society should resolve that the price of wheat should be $1.50 per bushel, of corn $1, of potatoes $1, and that all vegetables and fruit should bring remunerative prices. Suppose they should put every farmer's life in jeopardy who sold below the scale of rates fixed by the society, and should boycott every corporation that carried the low-priced produce, and every firm and individual that bought or used it; wouldn't things be lovely then?.....

A WRITER in the Cultivator says that stock husbandry must be the foundation of all long-continued successful farming. Any other system is one of slow exhaustion and ultimate sterility.....

HE further estimates that a ton of pea meal will yield in the manure $14.28 worth of fertilizing elements, while one ton of Swede turnips will give only 91 cents. ... .

WE presume that 99-100 of all the wheat heads selected as "different from the variety sown," and again sown as new wheats, are old kinds: that is, old in other parts of this country or some other.....

NO, IF imitation-butter people had sold their compound for what it is, the idea of taxing it would never have been entertained.....

PUT your skim-milk and buttermilk into calves or pigs, supplementing them with corn meal and a sprinkling of oil meal, says the U. S. Dairyman. Give both calves and pigs room to move around in and keep clean. Both will be benefited by having good grass to feed on in addition to what is carried to them. It will keep them healthy and contented, and promote growth. Plenty of clover is a good preventive of hog cholera.....

MAJOR ALVORD is of the opinion that irregular milking affects the size of the fat globules. When milked irregularly, the globules are smaller, though more numerous .....

THE oleomargarine people tell us that half the wine sold is not real wine at all, but an imitation of wine. Why, then, they ask, should the law not oblige them to sell it for what it is? Truly, why not?.....

AT this season of the year swale and swamp water is simply abominable, says the Dairyman. It is full of germs of decay, corruption and disease. Bacteria, and all sorts of disease-engendering spores are contained in stagnant water. When drank by human beings its effects are said to be malarial. The effect on cows is similar. It makes them sick and feverish, and causes them to give feverish and unwholesome milk. Pure brook, spring or well water is a requisite in the production of sound, wholesome milk. And the water must be easily accessible, for cows will not travel long distances for water, in the hot sun, until they suffer badly for want of it. When they reach it they will drink to excess. This will also make them feverish and sick and spoil the milk. See that they have plenty of clean, sweet water, easy to reach .....

Is there any valid reason why, by proper selection and breeding, the large milk flow of the Holstein-Friesian may not be made as rich as the smaller one of the Jersey, asks the above journal? She does not give more milk in proportion to her size, than the Jersey does. If we can add the secretion of a little more fat, all drawn from carbonaceous material, why should it be any more of a tax to her system than it is to that of the Jersey? It looks reasonable that by breeding and feeding more fat may be secured. This done, the Holstein-Friesian cow would be the ideal "general purpose" cow of the world. Is not a hint to the owners of that breed sufficient.....

CHEESE that is easily crumbled is digestible, and may be eaten without fear. It is the India-rubber article that gives one a fit of the blues.....

BUTTER, butter, wondrous fair!
How I wonder what you are.
Are you really what you seem,
Are you made of grease or cream?.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LXI.

MARY WAGER-FISHER.

Professor Hilgard; Department of Agriculture in the California University; exotics in California; mixed husbandry needed; silk culture, a failure in flush times, a possible success now; females in agriculture; felling trees with giant powder; ground-squirrel nuisance.

I HAD a talk with Professor Hilgard, of the California State University, concerning the outlook of silk culture in this State. Professor Hilgard's name is a familiar one to RURAL readers, and I was delighted to find him to be a very charming gentleman, and he has the reputation also of being "a very good man." He is of German birth, and speaks with a noticeable but entirely pleasing accent. He is of medium hight, rather slight in figure, has blue eyes and is a man of quick and active temperament. He is at the head of the Agricultural Department of the University, which, so far as I have been able to judge, does for California very much what the Agricultural Department at Washington does for the United States, omitting its blunders. So far as training young men for agricultural pursuits, it accomplishes little. Occasionally a young man, after finishing his collegiate course, tarries a little longer for agricultural lore, if he purposes farming, studies the analyses of soils, and learns where to plant almonds and where not to try olive culture.

The great value of the Department is in its experimental and distributing station—sending out plants, cuttings, etc., all over the State. It is probably due in large part to this that California has become so rapidly the home of a multitude of exotics, ornamental and useful in a striking degree. In the experimental grounds, one can see some things growing that he has probably not seen elsewhere in the United States—cinchona, for example. This plant, although growing finely in the open ground, had been furnished with winter protection by a rampart of earth and a framework around it covered with bagging; but the Professor thought this provision might have been dispensed with. Chinese bamboo, a very graceful plant, does well here. Professor Hilgard believes in the cultivation of cotton, which has been successfully grown all the way from the Mexican boundary to Shasta County, and even tea for California; and it is quite evident that the agricultural resources of the State have only begun to be developed. Asia, Japan, Australia, the islands of the sea, are all being levied upon to increase the variety of California products, and it is surprising to note the variety of fruits that flourish in any one nursery. Times have so changed since the days of '49, that one rarely hears of mining, but on every hand of the production of fruit and grains.

But to return to silk culture. Mulberry trees do admirably here, and the rainless Summers are good for silk-worms, as rain and wet tend to mold and mildew. The climate of China and Japan is more equable, but the California climate, in its way, is the worst drawback the State has. The people depend too much upon it, and place too little reliance upon industry and economy for success. It is a common remark, that the reason so many farmers fail in California is because they plant but one crop—and then "go fishing." If that crop fails, all fails, and they have nothing left to depend upon. But more versatility in farming is being practiced. The climate in another way is not good for silk-worm eggs—it is not cold enough, and the eggs hatch the worms before the mulberry leaves are out, and they have to be fed on lettuce—which is something like rearing a baby on a bottle. But the women who form the silk culture association—and women have a peculiar persistency in trying to make a success of indifferent things—have impressed Prof. Hilgard into their service. An experimental and distributing silk-worm station has been established at Piedmont, a beautiful region near Oakland, where the hatching of the eggs will be retarded by artificial cold—and whence they will be distributed at the proper time. So far, so good. But the successful and profitable cultivation of the silk-worm has so far only been compassed in countries with a comparatively dense population, and where every penny is carefully looked after, and small profits are kindly regarded. But in a State sparsely as yet populated, and where until only recently nothing less than a $20 gold piece was thought worth picking up, it was nonsense to talk of silk culture. True, it was tried—on a large scale. There were shanties of silk-worms with Chinamen put in charge. It was proposed to produce cocoons on a large scale—on the wholesale plan—but the experiment was a complete failure. Now things are different. Finances are down to a nickel basis and the penny is even talked of, and will soon arrive, and there are many women in California as elsewhere, who are desirous of being able to earn a little money in an easy, quiet way, and it may be that there will be enough patience and industry developed to supply the State with cocoons for home manufacture. At San José there is a silk factory run by French weavers from Lyons, and they make very nice silk from imported material. The quality of both California cotton and silk is excellent. The cotton, so far, has been absorbed by the woolen manufacturers in mixed goods.

I don't know how well broken-down Eastern "school ma'ams" have succeeded here generally, in an agricultural way, but there are some distinguished farmerines in the State. Mrs. Hill is credited with having made a fortune of half a million in raising pyrethrum insect powder (she has invited me to visit her at harvest time in May, and if I am able to do so, I will be able to write definitely of this industry) and other women have achieved money and fame in raisins, goats, honey, citrus fruits, etc. But, after all, it is the *woman*, as it is the *man* who succeeds—and the success might come in the East as well as in the "West, by the sea."

During a stroll through the experimental garden at Berkeley, the seat of the University (open to both sexes equally) we came upon a tree that had been felled by giant powder—a method, Professor H. said, that was frequently employed in California because of its cheapness. A hole is first bored under the tree, in which the powder is placed—six pounds costing 70 cents had been used for this tree. When the tree comes down, there is no stump left to be grubbed out by hand labor, it is out of the ground, roots and all.

A great annoyance is caused to farmers by the ground squirrels which burrow in the ground. One mode of exterminating them is to smoke them to death, and there are machines for driving the smoke in their holes. These squirrels are particularly destructive to wheat.

RURAL SPECIAL REPORTS.

Delaware.

DOVER, Kent Co., August 7.—The Summer thus far has been the wettest and coldest we have had for a great many years. It is so wet that it is almost impossible to get wheat dry enough to thrash. Much that has been thrashed has to be spread and stirred in order to dry it so as to make it fit for market. Corn has not been worked as it ought to have been in consequence of the rain, and early potatoes are rotting. In this neighborhood what few peaches are left are rotting badly, and the low prices of farm products make a bad show for farmers. Corn is looking well, all things considered. I never saw young clover look so promising. Many fields are fully knee-high and in full bloom. Wheat a fair crop. Oats good. Hay fine. Millet is doing finely; some fields two feet high, while others sowed late, are six to ten inches. Berry crop good; price, low. Apple a fair crop. Quinces blighted badly; many trees nearly killed. Grapes rotting. Prices about as follows: Wheat, 75c. to 78c.; corn, 40c.; oats, 40c.; potatoes, 40c. to 45c.; butter, 16c. to 20c.; eggs, 14c.; chickens, 10c. to 12c.; cabbage, $2 to $3, per 100; other things about in proportion.

S. T. S.

Illinois.

STERLING, Whiteside Co., Aug. 4.—Frequent rains in the forepart of the season made farmers late with corn planting and late potatoes Some of the ground we could not plow until after June 1; but since the middle of May, there has been rain enough to wet the ground only once, and then only an inch, and it did not reach the potatoes. Result a very large crop of tame hay; less than half a crop of early potatoes; wheat and rye good. Oats very short and not extra filled. Strawberries stopped off at half a crop; raspberries, one-third; blackberries one-eighth. Early sweet corn fair; late field corn must have rain soon or fail. Late potatoes a failure anyhow. Pasture as dry as a bone and almost all are now feeding hay as in "Winter." Fall hay will be nothing, so we are not feeling as bright as usual, but I think we will get over it.

JAS. H. W.

Iowa.

OLIN, Jones Co., August 3.—We have had a long and severe drought, and it still continues. Grass moderate or light in quantity, but of extra quality. Small grains generally an average yield and of good quality. Corn promises to be a light crop unless it gets rain soon. Buckwheat and Hungarian, of which there is generally more or less raised every year, very poor, principally a failure. Potatoes to some extent past help. Early ones very light, indeed. Beans and onions failures. Garden vegetables generally, of very little account. Melons promise a short crop—only very few raised. Not much cane raised, must share the fate of the corn. Rural seeds promise fairly well.

I. A. B.

Missouri.

ELDON, Miller Co., July 31.—Wheat, oats and hay are all harvested and are full average crops. Corn, which is really our staple crop, is being very seriously damaged by continued dry weather; in fact, unless we have rain in a very short time the corn crop will be a failure. Pastures are getting short on account of the weather, and stock will begin to lose unless farmers commence feeding. Potatoes are good, especially early ones. Cane also promises a good crop. Considerable wheat will be sown this Fall, though not more than the average. I notice quite a number of farmers are improving their farms, so that times cannot be so very hard with all of them.

N. J. S.

South Carolina.

COLUMBIA, Richland Co., Aug. 10.—The Department of Agriculture has received 257 special reports, covering every County in the State, on the condition of the crops, and furnishes the following summary: The reports of the cotton crop with few exceptions are unfavorable. The correspondents generally concur in the opinion that a larger yield than is now anticipated will be realized if the Fall is late. The condition on the 1st of August is in Upper Carolina, 62, Middle Carolina, 66, Lower Carolina, 73; average for the State, 67, which is lower than it has been at any time since the war. Corn in many places on bottoms was totally destroyed by the Spring floods, and only a part of these was replanted. The condition is reported in Upper Carolina at 68; Middle Carolina, 74; Lower Carolina, 83; average for the State, 74. The condition of the rice crop is generally favorable, except where it has been injured by the freshets. One-half the crop is estimated as destroyed. In Georgetown the condition is reported at 84. Other crops as follows: Sorghum, 85; sugar cane, 89; peas, 80; Irish potatoes, 91, and sweet potatoes, 91.

P. A.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

RAISING WATER BY POWER OF A CURRENT.

H. S. C., Harvall, Dak.—My farm is at a point on the Missouri River where there is a strong current. The house and garden are 100 rods from the river and 60 feet above it. The water is very muddy, would that make any difference? 1. Is there any inexpensive way whereby sufficient water can be forced up, by the power of the current, to irrigate two acres of garden? Would a hydraulic ram work in such a place? Would it be cheaper to use a wind-mill, and pump water out of a well 60 feet deep into a tank? How large should the mill and tank be?

ANSWERED BY HENRY STEWART.

It is quite an easy matter to raise water from a swiftly flowing river for the purpose of irrigation, and at a very small expense. Indeed, the ancient and modern system of irrigation in Egypt consists largely in the use of a wheel turned by the current and having buckets upon the rim, which raise the water and pour it into troughs that carry it on to the fields. These fields are called norias, and are exceedingly frequent along the banks of the Nile. In the case mentioned, however, the hight above the river of the land to be irrigated would call for some other device to be used with a wheel for lifting the water. This would be a force pump operated by a crank fitted to the axle of the wheel. A wheel of eight feet diameter, for instance, might be fitted in a frame built in the river; it would be provided with floats or paddles a foot square—as the paddle wheel of a steam vessel—which would be moved by

the current, thus turning the wheel. The wheel, being fitted with a fixed axle, which turns in proper bearings, would easily operate a crank, and work a force pump attached to the wheel frame. This pump, with such a wheel and a current flowing four miles an hour, would easily elevate water enough for two acres of land 60 feet above the water level. A two-inch pipe might be used which would furnish water enough for perhaps four or five acres. The whole arrangement, including pump and pipe, might cost not more than $10; and a cheap pump and iron pipe would cost perhaps $10 or $12 more. There is no reason why a competent person should not adopt this simple method to raise water enough from such a river to irrigate a whole farm, furnishing water for 200 acres at a very reasonable expense, and with less cost than that of making a long ditch. A two-inch pipe would discharge about three square inches of water, and supply about 2,000 cubic feet every 24 hours. In a very dry climate one cubic foot per second of water is sufficient to irrigate 200 acres of land. The mud in the water would be an advantage, as it would make a valuable fertilizer. A hydraulic ram would not operate in such a case as this. The power of the stream would be cheaper and more desirable than a wind engine, giving more power for the same cost, and a constant power instead of a variable one. The method of raising water above described might be varied by using the submerged propeller motor, which would work at any stage of the river, in high or low water; or by fitting the wheel on a floating platform, which would rise and fall with the river, and could be held to the bank or anchored in the river, and could be adapted to thousands of cases where water could be made useful in irrigating meadows and crops, market gardens, etc., in dry seasons. The present season is prolific of instances of this kind.

HEN MANURE, ASHES AND PLASTER.

E. E. B., Norfolk, Va.—In a quotation from Mr. Henry Stewart in a late RURAL, we are told of the great value of a mixture of hen manure, ashes and plaster; now, would not the addition of wood-ashes to hen manure liberate the ammonia, so that it would be lost?

ANSWERED BY HENRY STEWART.

The mixture of the common home-made fertilizer, poultry manure and wood-ashes, is really one of the most valuable manures, because it contains every element of plant food. But it has somewhat of the quality of soda water, viz., that it must be used as it is made, because, like this exhilarating beverage, the mixture produces a gas which escapes very rapidly and leaves a "flat, stale and unprofitable" residue. It is one of the peculiarities of alkaline substances that they have a strong action upon nitrogenous substances, converting inert nitrogen and nitrates into ammonia, which is volatile and so rapidly escapes into the atmosphere. Hence to mix ashes or lime with manure of any kind, is to start an effervescence, so to speak, as in the soda water; then is produced a volatile gas which is lost, unless the mixture is used immediately. This activity of the mixture is one of its good and useful points when one understands it, but otherwise it is a dangerous one. In all cases it should be guarded against and controlled, and this is best done by adding plaster to the mixture. Plaster is sulphate of lime, a combination of sulphuric acid and lime, and when it is brought into contact with ammonia (the carbonate is usually the form in which this exists in manures), the lime and sulphuric acid separate; the former takes carbonic acid, for which it has a stronger affinity than for sulphuric acid, from the carbonate of ammonia, and the ammonia and sulphuric acid then unite and form sulphate of ammonia, which is not volatile. The mixture is then safe, and can be kept without loss until it is used. Hence the great usefulness of plaster as a deodorizer and purifier of stables and poultry houses, as well as domestic cess-pools and drains. My own practice has been to mix plaster with the manure by dusting it thickly over the floors of poultry houses, horse stables and cow stables, thus using it where and when it will do the most good most conveniently.

SAVING CLOVER AND SORGHUM SEEDS, AND CRIBBING CORN.

L. S., Thibodaux La.—1. What is the proper way to save clover seed? 2. How are sorghum seeds saved? 3. Is there any device for putting corn in the crib direct from the wagon instead of dumping it on the ground, and then throwing it by hand into the crib? Could the corn be elevated by hydraulic pressure from water pumped into a tank by a wind engine?

ANS.—1. Clover seed is saved from the second cutting. It can be very easily gathered by using a mower with a cloth attached to the cutter-bar, upon which the heads gather, and can be raked off by a boy following, with a light, wide rake. To separate the seed, it is run through a machine called a huller, which rubs the pods and breaks them, and so liberates the seed. Except for market and for ordinary sowing, the rough, unhulled seed may be used, sown on the freshly harrowed soil and covered with a brush harrow or smoothing plank frame. We have separated the seed from the hulls reasonably well by using a common thrashing machine with a bag over the discharge opening, so confining the chaff and choking the machine, and making it discharge so slowly that the hulls are rubbed to pieces and the seed freed. So much seed always remains in the chaff that it pays to sow it on the meadows and pasture lots as a reinforcement. 2. The seed of sorghum is thrashed out with flails, the heads being cut when the canes are trimmed, and saved for the purpose. 3. The most effective way of unloading corn is by elevating the whole load, the wagon-box with its contents, and dumping it into the crib. This can be done by simple machinery made to wind up a rope running through some blocks, and then tipping the wagon-box. An elevator with large cups could be made, into which the corn could be shoveled; but this method would not be much saving of labor. An excellent method is to have boxes holding each a bushel, made light of strips, and easily lifted. The corn is thrown into these boxes as it is gathered; they are lifted into the wagons and taken to the crib, and emptied very quickly. A hundred or more of these harvesting boxes would be exceedingly useful for this and other purposes. There is no gain in using water for the purpose mentioned, but a loss of power, and it would be better to use the power directly.

SMALL FRUIT QUERIES.

F. C., Leomenster, Mass.—1. What are the best varieties of black and red raspberries for home and market in this section? 2. Is it true that the Shaffer throws out no suckers? 3. What are the best sorts of strawberries? 4. Who is a reliable nurseryman near here? 5. Can upland or other wild cedar be transplanted this Fall? 6. Can the tall sort of shadbush be successfully transplanted in August or September? 7. My quince trees bear a great many small, dead twigs, some say the cause is fire blight; isn't the injury due to the lack or presence of something in the soil, which is wet? 8. Is the Versaillaise the largest and best currant? 9. What is the best gooseberry free from mildew? 10. What is the surest way to kill Crab Grass? 11. What is the best blackberry? 12. Is any thornless raspberry or blackberry profitable for market?

ANS.—Red: Hansell, Marlboro, Cuthbert. Yellow: we are inclined to think that Golden Queen will prove the best. Black: Souhegan. Try the Hilborn and Earhart Everbearing. 2. It throws out suckers sparingly. 3. For market we should name the Crescent, Jewell and Sharpless. For home the Cumberland, Downing and Parry. 4. Stephen Hoyt's Sons, New Canaan, Ct.; Hale Bros., South Glastonbury, Ct. 5. We should wait until Spring. Select small plants with all the earth about the roots possible. 6. Yes, in September. 7. We cannot say. 8. We prefer Fay's as the best red. 9. Downing. 10. Cultivation when the soil is dry. 11. Probably the Dorchester is best for you. We prefer the Kittatinny, its only failing being tenderness. The Snyder and Taylor are hardy. Fruit good, but not large. 12. No. We do not know what the berry which you speak about is from your description. We should like to try a plant.

"BLIGHT" IN CURRANTS AND CHERRIES.

J. J., Toronto, Can.—A blight fell on some of my cherries and currants this year when the fruit was half-grown in some cases, and well formed in others. The Cherry, White Grape and Fay's Prolific Currant were nearly all destroyed, while Prince Alberts in the same row were not touched. Coe's Transparent, Downer's Late and Governor Wood Cherries were all badly blighted, while the Dukes and Morrellos in the same rows were not touched in leaf or fruit. The fruit of the affected trees shriveled up and fell to the ground. What was it?

ANS.—The description of the "blight" referred to is not sufficiently full and clear to give us a clue to its nature, especially as it attacks species so distinct as currants and cherries. We have seen the foliage of currant plants badly injured, and the crop made nearly abortive, by thrip, seemingly identical with that of the rose and the apple. This season, our currants, both Fay and Red Dutch, have lost their foliage sooner than usual, but not to the injury of the present crop, though probably weakening the plants for next season. We have also noticed the appearance of a partial russeting of the fruit, especially of the Fay, which is perhaps the work of a mite such as produces the russeting of the orange. Unless the blight spoken of is general in our correspondent's neighborhood, it is probable that it may be due to some local cause, either in the soil or air. Are there chemical works near by, or some manufacture from which fumes noxious to vegetation might arise? Does the soil need under-draining, or is it a clay soil, heavily manured from the stable? The latter would be likely to damage cherry trees, but hardly currants.

FOOD FOR POULTRY.

G. C., Summit Sta., Ohio.—It is not desirable to depend upon any single grain as a food for poultry. Wheat gives the best satisfaction where eggs are required or for the feeding of young chickens. Rye fed alone would not give as good returns as the wheat, but mixed with wheat, or fed on alternate days or weeks, it will prove valuable. The value of rye as a food for stock is not generally understood, and only rarely considered. In many places it is very successfully used for fattening hogs, and many farmers esteem it highly as a food for horses. Compared with other grains, the chemical constituents of rye are found as follows in the tables prepared by Dr. Jenkins:

	Total dry matter.	Protein.	Fat.
Rye	88.40	10.60	1.70
Wheat	89.56	11.87	2.13
Corn	89.51	10.62	5.49
Oats	89.30	11.30	5.00
Sweet Corn	91.41	11.71	8.31
Barley	88.90	12.40	1.80
Buckwheat	87.40	10.00	2.25

Judging from the chemical analyses given, rye ranks low as a stock food, but practical feeding shows better results.

WOOL WASTE AS A FERTILIZER.

H. H. Somerville, N. J.—I can buy wool waste for 50c. a load half a mile away; will it pay to use it as a fertilizer, and what is the best way of utilizing it? A good deal of it is wasted, because farmers don't think much of it.

ANS.—Here is a mine of wealth going to waste. Wool contains 17 per cent. of nitrogen; in an unavailable form at the moment, it is true, but in the form of the waste of woolen mills it slowly decomposes in the soil and gives up its nitrogen to the crops. Its nitrogen is in such a form that it is one of the most lasting of fertilizers. It is highly valued, and hop growers find it the most useful manure they can procure for their gardens—and English hop growers pay $25 to $50 a ton for it. If H. H. is wise he will make a long contract without delay for this waste and secure a bonanza. It can be used for any crop, spread on the plowed ground and harrowed in. It is excellent for wheat when thus used; also for corn, turnips and garden crops as well as for a top-dressing in the form of compost for grass land; and, in fact, for anything, any where.

Miscellaneous.

J. W. W., St. Mary's, Pa.—1. Does hemlock saw-dust keep moisture in the soil? 2. Does it warm or cool the soil? 3. Does it do any harm? 4. How does it compare with leaves as an absorbent of ammonia in liquid manure when used for bedding stock? 5. Would it be well to use it, after it leaves the stable, on a clay-loam truck patch?

ANS.—1. If applied as a mulch it would tend to prevent evaporation from the soil, and would therefore keep it moist. 2. Cools it by intercepting the sun's rays. 3. Yes, it harbors insects of various kinds; makes the soil sour and mouldy. 4. It is a better absorbent than leaves by far. 5. No, we should not use it unless rotted in a compost heap.

E. M. C., Pittsburg, Kan.—My white grape vine, a week earlier than Concord, regularly blasts, having never borne more than two pieces of clusters. It is about the size of the Delaware and sweet, with a thin, deeply serrated leaf, and is a rampant grower. I suppose the cause of its blasting is that it isn't properly fertilized; what would be a good sort with which to fertilize it?

ANS.—Yes; no doubt the flowers are imperfect. It *may* be, however, that the pistils are imperfect, in which case there is no help. Try Moore's Early, Lady, Cottage, Elvira, El Dorado, Florence, Early Victor or Jessica.

W. F. K., Clinton, La.—Of the grasses sent for name, No. 1 is Panicum Texanum, Texas Millet, native of Texas, first described by Prof. S. B. Buckley in 1866. It is of vigorous growth, with many culms crowded at the bottom, succulent and yielding a large amount of forage. It is by some considered far superior to any grass for that climate. It is an annual, growing five feet high. It is a much more certain crop than millet. All kinds of stock relish it. It requires rich soils. Mr. Ravenel has cultivated it in South Carolina, where it is naturalized and freely seeding and propagating itself. No. 2, Leptochloa mucronata—Feather or Slender Grass. This is not of much agricultural value. It is nutritious, but several acres would be required to produce a ton of hay.

J. H., Dent, Ohio.—On new, rich land, will Diehl-Mediterranean Wheat lodge? Velvet Chaff did not on similar soil.

ANS.—Velvet Chaff Wheats, with us have always developed weak culms. The Diehl-Mediterranean does not yield as well on the RURAL'S Long Island Farm as it appears to do in other climates. It has never lodged, however, and we fancy that the straw is as strong as that of any other variety. On Mr. Woodward's (Western N. Y.) farm the D.-M. is highly prized.

E. E. B., Norfolk Co., Va.—To make white-wash, take a peck of salt dissolved in water, one-half bushel of well-burned, fresh quick-lime and two buckets of boiling water. Put the water and salt and lime into a barrel and put on a cover to keep the steam inside. Make the wash about as thick as thin cream, and strain through a cloth. Soak a pound of glue in water. Add three pounds of rice flour and mix. Add this to the white-wash and put in enough hot water to make the mass of the right consistency.

DISCUSSION.

W. H. T., ST. GILES, CANADA.—To pick up the salt question again. In Summer my cattle are fed salt, because my wife, like others, will not believe it is unnecessary. The cows are enticed to eat it by putting it into their feed. Then they only eat a tablespoonful once in 10 to 15 days. My horse eats none at all, but the sheep want it every day. My pasture contains about everything in the vegetable kingdom, and the cattle eat more or less of everything in it. In Winter my cows and calves get a feed daily of roots, and the latter have oats. They average about a tablespoonful of salt every week. The other cattle have two feeds per day, one of hay, cut green, and one of straw cut before full maturity and the lightest grains left at thrashing. These cattle get no salt at all during the six months of Winter. They keep in fine condition, slick and fat. I do not pretend to say that they keep in good condition *because* I feed them no salt, but that they are so notwithstanding the fact that I feed no salt. The argument that salt goes through the body unchanged is no argument against its utility. It is certainly separated from the other food before being evacuated, and does not follow the greater vessels of the body to be as speedily gotten rid of as possible, as the injurious or neuter bodies are. It is taken up and found, if not utilized, in the most minute vessels of the body. I firmly believe, however, that by far too much salt is fed to stock ordinarily. I would not on any account allow my cattle free access to salt. My idea is that cattle, like men, inherit a predisposition to several tastes and habits. Salt-fed cattle will be sure to bring forth salt-desiring young. After feeding salt to stock for many generations, it would be cruelty to deprive their progeny entirely of it. It seems evident to me that plants in more inland counties do not contain as much saline matter as do those nearer the sea coast. This may explain why animals on the prairies or in mountainous countries will travel so far after salt. I claim that when we feed an unnatural diet containing a less proportion of salt than is found in well cured green hay, and light grain cut with the straw, we should make up the deficiency and not otherwise.

J. M. M., Clay Co., Fla.—J. C. S., page 495, should renew the wood of his grape-vines by growing new wood each year, and cut away the wood that has borne fruit at the close of each season, near the ground. He will thus avoid all danger of his grapes rotting on the vines if the soil is properly drained and fertilized. I use cloth for bags for grapes, to keep off birds and insects. These bags will last five years if taken care of. I have 500 vines that I shall trellis with bird-proof galvanized wire.

THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, AUGUST 21, 1886.

HAS Simon's Plum fruited with any of our readers? If so, we would be glad to hear about it.

☞ *The SUPPLEMENT of the RURAL NEW-YORKER Special to be issued Sept. 4th will be mailed to subscribers and all applicants from its date until next May or June.*

Advertisements for the Supplement should be sent in at once. The price will be 50 cents per line to all. Advertising patrons need never apply to us for special rates. We have no special rates.

THE plot upon which our experiments with different fertilizers upon potatoes were made this year, is about one-eighth of an acre. Two men were engaged 16 hours of last week in digging, weighing and counting these potatoes. The yield of the entire plot will not exceed 90 bushels to the acre. Some of the trenches yielded not over 25 bushels—others as high, probably, as 400. The longer we are engaged in purely experimental farming, the more evident it becomes that the average farmer can not afford to experiment in a careful, systematic way for himself. Hence the value of Experiment Stations, if only they be conducted by intelligent, earnest, practical men.

IN the RURAL'S potato experiments of the present year, the potatoes fertilized (separately) with acid phosphate and muriate of potash were more corroded, so to express it, than those fertilized with bone or sulphate of potash. Whether this corrosion of the surface was due to wire-worms or to a fungus, or both, we cannot say. The entire report, which, we think, will be of special interest to all readers who use, or intend to use, concentrated fertilizers, will appear in a few weeks. It strengthens our previous experiments, which, in the worn-out soil where they were made, tell us that only *complete* fertilizers will materially increase the crop.

DOES SCARLET FEVER COME FROM THE COW?

EARLY this year, something like an epidemic of scarlet fever occurred in a part of London, and strict investigation showed that it started among the customers of a certain dairy. The supply of milk from that source having been stopped, the cases grew fewer. The strictest search, however, could find no cases of fever among the people at the dairy, and the cows appeared in fairly good health. At length it was noticed that there were sores on the milk bags of some, and that along the back and on the tail, the hair did not grow firmly. The beasts were killed, and it was found that their lungs, livers and kidneys were affected. The loose hair and the local sores, like the red skin in man, were only outward signs of a disease tainting the entire system. A dog and a calf were inoculated by virus from the sores on the udders, and in each case the diagnosis was confirmed by the post-mortem. It has long been known that the cause of scarlet fever is as specific as that of yellow fever or dyphtheria; that it is carried very easily for long distances, and that milk can be a medium of carrying it from house to house; but it was thought it must be first contaminated from a human source. Beyond this, science has never hitherto been able to conjecture how or where it originated. From the above discovery, however, the honor of which is due to Drs. Power and Klein, it is now claimed that it starts from the cow, like cow-pox, or like rabies from the dog or glanders from the horse. The disease was identified in the cows by well known symptoms; it was made to reproduce itself in other animals, and it was shown that it produced scarlet fever in man. The doctors believe the milk in the udders of affected cows is wholesome; but in milking, it becomes charged with disease germs which rapidly multiply. They claim to have seen the chain-like disease germ (streptococcus) and to have cultivated it in pure milk more easily and as certainly as plants can be raised from seed. Years ago Dr. Peters, of New York, during a virulent outbreak of the disease here, concluded that it afflicted the lower animals as well as man, and another physician declared it could be prevented by inoculation. Have the English physicians drawn too wide an inference from insufficient data? In any case, what American doctor will earn the great honor justly due to the discoverer of some antidote against this most deadly of children's diseases.

MORE VETERINARIANS.

IF a fair proportion of the young men who graduate at medical schools each year would devote themselves to the practice of veterinary science, the world would be better off. The last census gave us 64,137 lawyers and 85,671 physicians, and these numbers increase at the rate of 1,000 or more each year. At the same time there were but 2,130 veterinary surgeons. We have doctors enough already. The more we have the more easily shall we be inclined to believe ourselves sick. We need better treatment for our animals. The live stock of the country is increasing in value with great rapidity. Over $300,000,000 have been added to the value of our cattle alone by care in selection and breeding. Where men have $500 or more invested in a single animal, they will be careful to consult authorities as to its health. The business of the veterinarian will be sure to grow. Every large stableman or breeder will eventually be forced to employ some one to look after the health of his animals. There will be money in such a position; it is an honorable profession and it offers a wide range for usefulness. Farmers' boys who desire to obtain an education and enter some profession may well turn their attention to veterinary science. Boys brought up on the farm, accustomed to watch animals in health and disease, will find no inconsiderable portion of the course in veterinary mastered when they come to attend the lectures. It will not be like making a complete change in his habits of thinking and living as he would be obliged to do in order to enter one of the so-called genteel professions. There is hardly a line of work in which success is more likely to follow hard and earnest labor. Some of the young men who have turned their thoughts towards the work of experimenting with the health of their fellow men will do well to consider the chances for energetic and studious men in veterinary science.

OLEOMARGARINE.

NEARLY three-fourths of the oleomargarine made in this country is turned out at Chicago. The large local manufacturers met there Wednesday last to consult with the Collector of Internal Revenue about the new law and its effects. It was at first determined to test the constitutionality of the law; but on due consideration it seems hardly probable this step will now be taken. A test case would be expensive and could not be decided under three years; and even if successful would certainly lead to the passage of another statute less open to legal objection and more grievous to them. The great objection is to the tax of $48 a year on retailers. It is thought that many of these will decline to pay this impost for the privilege of selling bogus butter under present risks and restrictions. The wholesale dealers also want the retailers to be allowed to put the concoction into any dish or jar brought by a customer simply putting a printed statement around it before putting it in the vessel.

The Commissioner of Inland Revenue has sent out circulars to the makers of oleo and the local collectors in the chief centers of the trade, asking for suggestions as to the most convenient yet effective means of carrying the law into effect. The Bureau of Printing and Engraving has begun to prepare the plates for printing the oleomargarine internal revenue stamps. They are to be in form and design like the tobacco stamps, and to be for 10, 20, 40, 80 cents and $1. The stuff is, it seems, to be put up in packages of from 10 to 60 pounds generally, and in Winter in barrels of 200 pound. It is under consideration whether it can be put up in stone jars. Thursday last, the Civil Service Commissioners at Washington gave directions that the examiners should devote their entire time to the examinations of candidates for clerkships and other appointments rendered necessary to carry the law into effect.

In this city, the directors of the self-constituted American Agricultural and Dairy Association, composed of a handful of large butter and salt dealers, but which has put itself very prominently forward in advocating the measure, met the other day, and passed resolutions of thanks to the Congressmen and others who were the most energetic supporters of the bill. It reported that it had spent $7,090.32 in championing the bill, of which $5,659 had been collected from the butter and salt dealers of this city, and the remainder has still to be contributed.

As a result of the passage of the law the price of butter has gone up two cents a pound within the last fortnight. The Commissioner of Internal Revenue says that if "moonshine" oleo factories are suppressed as vigorously as illicit distilleries the law may have an effect entirely different from what its advocates anticipated. One of its first effects will be to drive small manufacturers out of the business, thereby increasing the profits of the larger establishments which will have a monopoly of the trade. It is thought they may entirey evade the law by coloring the stuff pink or green; for, as the President pointed out, the statute applies to a substance "made in imitation or semblance of butter," and they would thus escape the reproach conveyed in another part of the President's messsge—that "hardly a pound ever entered the poor man's house under its real name and in its real character."

FOREST FIRES.

DURING the past few weeks, forest fires, nearly unequaled in extent and in the value of the property destroyed, have raged in different parts of the Northern States. From Maine to Minnesota the air has been black and heavy with the smoke and ashes of burning forests of white pine, spruce, beech and hemlock. A few weeks ago, the forests in the upper counties of Maine, the slopes of the White Mountains in New Hampshire, and to a less extent in parts of Vermont were sadly laid waste by extensive fires, which destroyed hundreds of thousands of dollars' worth of timber, besides much other property. Smaller fires have darkened the sky by day, and lit it up by night, along the timber regions of Northern New York, and westward through Ontario, Canada. The most destructive of all, however, have been raging for the last week in the great pine belt of upper Michigan and Wisconsin. Here lay the most valuable and productive white pine in the world, while beech and maple also abounded. The reports of disaster come from widely separated parts of both States. The two Michigan peninsulas are equally affected. Thousands of acres of valuable timber have been destroyed all along the Lake Superior water-shed of the upper Michigan peninsula, while reports tell of widely scattered devastation in various parts in the northern part of the lower peninsula also. Bay, Mecosta, Newago and Lake Counties have been heavy sufferers, and the fires are still spreading.

Still greater has been the devastation in Wisconsin. Vast areas of timber have been destroyed on the waters of the Upper Chippewa and on the streams that flow into the Menominee both from Wisconsin and Michigan. A great line of flame and smoke with a frontage 100 miles in extent, is reported along the St. Paul Railroad east of Ashland. Other conflagrations are reported from various widely separated parts of the upper section of the State.

The destruction of standing timber must be enormous. A careful estimate of the pine burned in the Menominee region alone places it at upwards of 100,000,000 feet, and this is a small area compared with the vast region devastated. An enormous amount of cut-timber, lumber, shingles and cord wood has also been destroyed. A great deal of dressed lumber has met with the same fate, 150,000 feet of chair stock, for instance, were burnt up, with the factory, at Marshfield. Farm-houses, outbuildings, fences, standing and harvested grain and all kinds of fixed farm property have been swept away. Several towns have been threatened with destruction, and some have been injured to a greater or less extent, while a few villages have been entirely destroyed. Such was the fate of Spencer where the loss was over $300,000. It is greatly feared that some lives were lost among those traveling, hunting or working in the forests and settlers in isolated clearings.

Great as must be the present loss, however by the destruction of these great areas of timber, and of prosperous villages and farm property, it is probable that the country will suffer more from the permanent injury done to the soil by the conflagration. Forest fires destroy not only the forests, but the soil that produces them. Many years, perhaps generations, must pass away before the slow growth and decay of humbler vegetation can build up a fresh soil rich enough in plant food for new forests to thrive and mature. The devastated region is naturally a forest country. Its severe climate, sandy and often barren soil, and inadequate natural drainage, render it unsuited for ordinary agriculture; while pine and several other species of trees grow there to perfection, and the most profitable use to which nearly the whole region could be devoted, would be the perpetual production of forests.

The area of forests burned in the census year of 1880, as estimated by Professor Sargent, was 10,274,089 acres, involving a loss of $25,462,250, besides the incalculable injury done to the soil by rendering it, in most cases, incapable of reforesting. It is highly probable that the forests consumed every year by fire are as extensive as those removed by the axe. The most numerous causes of fire in Michigan and Wisconsin, as in the rest of the country, are the burning of trees and brush-wood to clear the land; carelessness on the part of hunters, who leave the embers of their fires unheeded, or throw brands or lighted matches among the dry grass, or set this ablaze with ignited gun wadding; sparks from locomotives; fires made by settlers for improving pasturage; and fires kindled from sheer malice. The wide extent and rapid course of the fires in Michigan and Wisconsin, are also in a great measure due to the methods pursued by the lumbermen of the region. Long ago they cut down all the trees that answered their purpose, trimmed them up and left the trimmings behind. These in course of time became as dry as tinder, and only a spark was needed to make a blaze.

What can be done to put an end to or minimize the danger from these causes? Evidently settlers must be more careful about clearing land and improving pastures by means of fire. They and their fellows will be the greatest sufferers through carelessness; but in addition to this cause for caution, heavy penalties for recklessness should be enacted. The carelessness of hunters and travelers should also be severely punished, whenever detection is possible. Unless laws are made and enforced in this direction forest fires must increase with the increase of our population. Railroad corporations operating in forest regions should be compelled by law to provide safeguards against the needless spread of fire. If carelessness deserves punishment, how much more so does malice? Little mercy should be shown to the wretches who purposely start a conflagration which may cause an incalculable loss of property and even life.

The lessons taught by the misfortunes of Michigan and Wisconsin should teach the people of every well-timbered State the importance of passing appropriate laws for the protection of forest property, and make their enforcement possible by teaching a true appreciation of the value of forests to the community and nation. Our forests have been too much reduced by a century of mismanagement, to allow the country to regard with indifference the losses incurred within the last few weeks.

BREVITIES.

A FIT subject for our agricultural Ex. Stations to investigate: the relative value of sulphate and muriate of potash.

SUPPOSE you exclude from the food of any animal either phosphoric acid, potash or nitrogen. Would the animal thrive? No more than the plant, we believe.

THE American Agricultural and Dairy Association, which was started here a short time ago by some butter and salt dealers, who were disgruntled at the refusal of the old American Agricultural Association to permit them to run it, has called "a National Convention of all interested in agriculture," etc., to meet in Philadelphia, next September 15 and 16. It says "proposals are now making to combine all the agricultural, dairy, live-stock and wool growers' associations in this organization for the most perfect work, and we shall yet see in it the most powerful institution for good the country has ever had." Well, nobody could ever justly charge the President and mouth-piece of the Association with too much modesty.

ACCORDING to the August report of the Department of Agriculture the winter wheat crop amounts to 295,000,000 bushels, and there is no likelihood of any considerable variation from this estimate. The spring wheat crop is estimated by the same authority at 136,000,000 bushels, or an aggregate of 431,000,000 bushels. Our estimates on July 3rd were: Winter wheat, 295,000,000 bushels; spring wheat, 140,000,000 bushels; aggregate, 435,000,000 bushels—difference, 4,000,000, altogether in spring wheat. Our estimate was made on reports up to July 1. This was before the great injury to spring wheat by the long-continued drought; but we made allowance for considerable injury from the drought then in progress.

A COMMON dodge of swindlers, male and female, is to pretend they are begging donations for some real or pretended charity, or for some real or pretended unfortunate. Great caution should be exercised in giving anything to persons begging for known charitable institutions, unless one is acquainted with the "begger." Many impostors preteud they are authorized agents for such institutions. In case of doubt it is always best to say "No" emphatically and stick to it. Even if the agent is authorized to make collections, he or she is working, not for charity, but for the percentage allowed out of the amount collected, so that there is really no reason why one should be over-sensitive with regard to the person's feelings. The percentage varies from 15 to 50 per cent., averaging probably 25 per cent. The less known or less meritorious the charity the greater the percentage, because the harder must be the agent's work to weedle the shekels out of the public's pocket. If you want to give a donation, give it personally or send it direct.

Years ago the E.-O. was taken in by a charitable fraud, and has several times refused to be taken in by a similar trick since. Quite a ponderous, well dressed and respectable looking man called with another rather shabbily attired. No. 1 very blandly introduced No. 2 as a poor man who had just lost his wife and some children by an accident in a different part of the town, and who was seeking charity to bury them decently. In a fine Tuvydrop style he expauded on the hardship of the case and the merits of the petitioner, and was superbly thankful for the contribution given. It was only after the pair had left that it struck the E-O that he knew nothing about either of the men, and "just for fun" he followed them and had soon ample proof that they were a couple of rascals. The swindle varies considerably in details; but is always fundamentally the same. What, in the name of common seuse, is the use of an introduction of a stranger by a stranger? The latter stranger may be an acquaintance of a couple of days' or even weeks' standing, but if you know nothing about him or his business except what he tells you, he is really a stranger still. A great many of the swindles perpetrated on poor, simple-minded people are successful, because the dupes are taken in through the introduction of one stranger by another. The more benevolent, honest, open-hearted and in every way plausible stranger No. 1 is, the greater the danger and need of caution. The man who looks, talks or acts like a rascal or worthless fellow, can have little influence for evil in this line; it is the oily or brusk talker, the dapper or pouderous embodiment of respectability or jolly-good-fellowship, that does all the mischief. Beware of all strangers, and consider every man a stranger till you learn a good deal more about him than he has told you himself.

About a year ago, the RURAL urged the Department of Agriculture to take up the exposure of swindles on farmers, and gave some very cogent reasons why it should do so. It followed our advice shortly afterwards, mentioning a number of frauds already exposed in the RURAL. Though no credit was given, we were glad of the wider circulation thus given to our exposures, and are very much pleased that the Department has again had recourse to this department in a late issue of its monthly report. Old readers of the E.-O. will remember that the following frauds have been denounced here, some of them several times. We mention them briefly as a reminder to old and a caution to new readers: One fraud is the taking of orders for some subscription book—in some cases the revised New Testament—and converting such orders into notes. Still another is the one operated by the pretended agent of a Bible or tract society, who presents himself at a farm house about dinner-time, and accepts an invitation to dine on condition that he may be allowed to pay for his meal. The society, he says, requires that he should pay his way, and to prove that he has done so he asks the farmer's signature to a form of receipt which he carries with him. In course of time this receipt comes back to the farmer in the form of a note for some money filled in by the plausible swindler. A lightning-rod agent agrees to put lightning-rods about a house for $5, and presents a bill for $105—$100 for the rods and $5 for putting them up. The collection of royalties on some patented article found in the farmer's possession, the sale of worthless recipes for the manufacture of fertilizers, the sale of rights for a worthless patent process for curing tobacco, the collection of fees by pretended officials, such as boiler inspectors, the "drive-well fraud," a variety of insurance frauds, and the sale of worthless recipes for the cure of "hog cholera" or other animal diseases, are among the numerous swindling devices mentioned by the Department.

As long as there is rascality on the one side and undue credulity on the other, such swindles will continue to be practiced to a greater or less extent; but they are now practiced successfully in many cases where they might be frustrated by the simple rule of refusing to deal with irresponsible parties without any known business standing or any fixed local habitation. The only additional precautions that suggest themselves as available to the individual are the exercise of reasonable care, the use of proper means to keep informed of agricultural matters, the education of farmers' children in business law, and the use of facilities for mutual protection offered by such associations as the Patrons of Husbandry, or other farmers' organizations. There are, however, some classes of frauds—such as the sale of fertilizers under false names and the manufacture of oleomargarine for sale as butter—which demand the efficient intervention of State or national authority. But even in this matter much must depend upon intelligent concert of action among the farmers themselves, both in suggesting the proper legislation and in bringing to bear on legislature the influence necessary to insure the proper action.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

WE FLING AWAY OUR GOLD.

WE fling away our gold.
Ease, comfort, pleasure never beg in vain.
From starving, homeless ones our mite withhold:
When seed thus sown might whiten all the plain!
We fling away our gold.

We send away our thoughts,
Half clothed and senseless, soft they speed away;
When, like the gorgeous tapestry inwrought,
They might add lustre to each passing day.
We send away our thoughts.

We throw away our time.
That golden gift we never know to prize
'Till life's high goal unreached, too weak to climb,
The last few moments pass our closing eyes,
We throw away our time.

We cast away our love—
We plant its flowers upon life's shifting sands—
We bend the tender blighted blooms above,
Watered by tears within our feeble hands—
We cast away our love.

—Lydia L. A. Very, in Salem Gazette.

OF INTEREST TO WOMEN.

THE great problem of how women clerks are able to work for lower wages than men has at last been solved by the San Francisco Chronicle. They do not play billiards, smoke cigars or drink cocktails. When they go to a theatre, somebody else pays. When they meet each other in the street, they do not "adjourn." Hence 40 dollars are to a girl as much as 60 dollars to a young man; while, of course, to the employer, they are just 20 dollars cheaper.

English philanthropists are discussing the eligibility of women as poor-law guardians. The great difficulty is the political qualification, candidates for this office must be parish ratepayers. It is the general opinion that in the treatment of the poor, women are both more prudent and more sympathetic than men. The chaplain of Clerkenwell prison particularly strengthened this argument from the experience of a want of womanly help he had known in just these sort of cases which had come under his care. No two girls are alike; each wants individual treatment, especially with the hereditary taint of drunken, dissolute parents. Go where you will, over the length and breadth of the land, it is impossible to visit a work-house without discovering some weak spot, owing to the want of just the housewifely experience which comes within a woman's province. To guage the misery now existing in the metropolis, it is only necessary to see the thousands of waifs and strays, who every night have no other lodging but the archways and out-of-the-way holes and corners of the great city. There is no end of work waiting for womanly effort, and the sex should be ashamed to waste life in the mere enjoyment of social pleasures. The busiest women are the happiest; they have no time for aches and pains and discontent.

Invention seems to have no end in the matter of lamp and candle shades. For lamp-shades, the silk and lace-trimmed parasol ones get larger and more elaborate, and for candle shades, exact representations, full size, of the Lilium auratum, or of a monkey's head, or enlarged colored pansies, or of butterflies, are much in vogue. Another form of the candle shades, or candle screens, as they should be called, for they only shade one side of the flame, are small colored paper screens, having in the centre a transparent medallion, with a group of Kate Greenaway figures, which, with the light shining through them, are seen to advantage.

The newest wall pockets are either plush, embroidered with bright colored flowers in the shape of an envelope with the flap cut off, or small baskets made to hang on the wall and fitted with pincushion, scissors, etc. Our grandmothers used to say every woman should be provided in every room with a pincushion, pair of scissors, and a duster. As regards the two first-named articles most ladies, if they have seen the scissors now being made with handsome brass handles and brass sheath, will, I am sure, be wanting a pair, and also one of the brass pincushions to match; but as to their requiring the duster nowadays "*Je m'en doute*," unless, indeed, it should be a particularly artistic one.

Of all the new materials produced in recent years, probably there is nothing prettier or more artistic than that now used in place of silk for ribbons, scarfs, sashes, etc. It is a material called canvas, and has various silky colors mixed with gold threads introduced into it. Some of these canvas materials make very pretty chair backs, borders for curtains, etc., as the colors are blended with such excellent taste that they look like the productions of some Eastern loom. English and French manufacturers seem year by year to improve in the art of arranging colors, and in this respect can no longer be considered as in anyway inferior to the far-famed natives of the East.

Ruskin asks: "What do you think the beautiful word 'wife' comes from?" It is the great word in which the English and Latin languages conquered the French and Greek. I hope the French will some day get a word for it instead of that of *femme*. But what do you think it comes from? The great value of the Saxon words is that they mean something. Wife means 'weaver.' You must either be housewives or house-moths, remember that. In the deep sense, you must either weave men's fortunes and embroider them, or feed upon and bring them to decay. Wherever a true wife comes, home is always around her. The stars may be over her head, the glowworm in the night's cold grass may be the fire at her feet, but home is where she is."

WHILE WE HAVE TIME.

OVER the fire-place in the sewing-room of a certain busy charity guild, is a panel of brass, bearing an inlaid scroll with the society's motto: "While we have time let us do good unto all men." A noble text, even without its prophetic ending—"for the night cometh, wherein no man can work." While we have time—that is the key-note of our success or failure. Not only material success, but also in the finer graces of the spirit. Our kindly words and gentle deeds; thoughts of sweetness and works of charity—all must be accomplished—while we have time.

But perhaps we spend all our lives in a hurry of seemingly sordid cares, too much absorbed to think even of these finer graces. How many women say they would gladly do something, anything, for suffering humanity, only they can never find time! Dear anxious Martha! cakes and pies are good things, and so are well-kept rooms and tasteful gowns; but they are very small and trivial if they cause us to neglect the Lazarus within our gates. And suppose your duty to your neighbor does not seem very plain in this direction. Perhaps there is no one actually in physical want within your range of vision—though this Utopian condition is rare. Then you must cultivate mental charity; kindly words and gentle deeds, whether in the home circle or in society, will make life easier for yourself and others. And you need not look very far for objects of material charity. We do not recommend Mrs. Weller's charity circle, which supplied red flannel waistcoats and moral pocket-handkerchiefs for the benighted Africans. "Charity begins at home," as the much-quoted and much-abused maxim says. We must first care for the stranger within our gates; then turn our attention to far-off lands. We once read of a generous woman who kept a certain savings which she called her love-purse. It consisted of money obtained by self-denial—all sorts of trifles which would be overlooked by other women. This she devoted to charitable works. Her generous plan might be followed by many; we can all offer our mite.

We must always bear in mind that if we ever

see *any* opportunity of doing good, either by word or deed, it is plainly our duty to do it. We must not think that perhaps somebody else would do it better, or that it is not really our business. We may rest assured that no good deed or generous impulse is ever lost, though we may not see its immediate fruition. If it does not appear to have the effect we intended the feeling that prompted it will "strike in," to use a homely phrase; we shall feel its grace in our own personality. Organized charity is a great power; but it merely represents in the concrete the deed and impulses we may all personally represent. "How far yon tiny candle throws its rays; so shines a good deed in this naughty world." So, believing that there is no time like the present, and no duties like those lying near us. "While we have time let us do good unto all men."

ROSE NOMENCLATURE.

FROM AN AMATEUR STANDPOINT.

THIS is a subject that will no doubt interest your young lady readers, and it is not to be wondered at. I suppose that they take such a deep interest in these flowers, as roses, like girls, are somewhat capricious in their nature, but as some one has said: "a thing of beauty is a joy forever," and with all their peculiarities we love them still. I trust the latter qualifications will atone in a measure for the former and keep me out of any difficulty with your fair friends.

They are certainly an interesting study (I refer to the roses, of course) as well as delightful ornaments, either on the lawn or in the parlor. It is an unceasing source of enjoyment to me to watch these beautiful flowers as they grow and blossom, to note their various habits and characteristics, or to admire their delicate tints and delightful fragrance. But when I come to classify them I am met with "confusion worse confounded." Turning to the catalogues of the florists, one man says a certain rose is a Tea, another a Hybrid Tea, another a Hybrid Perpetual, and another, perhaps, a Hybrid Noisette, till I am at a complete loss to know what it is. Of one thing, however, I am pretty well convinced, and that is that it is a Hybrid of some kind. This leads me to look up the botanical classification and history of the rose, which, although very interesting, fails to throw much light on the particular plant in question. The fact is, I suppose, as I find stated in the article on the rose in Appleton's Cyclopædia, "The roses of our gardens and greenhouses are for the most part varieties obtained by selection and by hybridizing and crossing (and I might add recrossing), and this has been continued so long that often all traces of their original parentage are concealed."

Under this state of affairs the best that we can hope for is a garden classification, but let us have one that will give the purchaser some idea of the nature and habit of the plant he is asked to buy.

All florists admit that the term "Hybrid Perpetual," under which, perhaps, the most interesting of our roses are classed, is a complete misnomer. These roses are not perpetual bloomers, as the term implies, but bloom at intervals or stated periods, usually in the Spring and Fall, although they are frequently treated in ways best known to the florists, so as to bloom in the Winter and other periods of the year. The French term "*Remontant*" (meaning literally "to grow again") is more significant and certainly a much better term than "Hybrid Perpetual."

The Ever-blooming or Monthly Roses are not strictly ever-blooming, but bloom at random, or apparently without any definite periods. This term, however, is not as objectionable as that used to designate the preceding class, and conveys a tolerably accurate idea as to the blooming habit of the varieties it comprises, but I should consider "random-blooming" a better term.

The term "Bourbon" designates a class of roses which originated on the Island of Bourbon [here we have a geographical name], and was undoubtedly the result of a cross between the Damask and Bengal roses. It is usually classed as an Ever-blooming Rose. It does not, however, possess the same habit of bloom as the Bengal and Tea Roses, but blooms periodically, the periods being more frequent than with the Remontant Roses.

The Noisette Roses are a class supposed to have originated from a cross between the White Musk and the China or Bengal Roses, and created some excitement when first introduced. They are certainly a remarkable and beautiful class of roses, but there appears to exist some confusion in these with the Climbers and Teas, and they are usually placed in the catalogues as a distinct class. Most of the Noisettes I believe are climbers, but some are not, or at least are not so distinctly characterized. They were named in honor of the man who originated the variety; but historical and geographical names are not wanted in our catalogues; we want something indicating the nature of the plant.

The Hybrid Teas are roses of recent introduction, the result of crosses between the Remontants and Teas, and are undoubtedly destined to supplant some of the older varieties in popularity, as they combine in varying degrees, according as they favor the Damask or the Tea, the robust habit and brilliant coloring of the Remontants, with the exquisite perfume, delicate tints, and more constant blooming habit of the Teas. The La France and Bennett are types of this class. By the way, I would like to ask as a matter of curiosity, how the yellow shades in our Tea Roses are derived. Are they natural to the species Caninæ, or do they originate from crosses of this species with some other, the Sulphurea, for instance, which is distinctly characterized by its deep yellow flowers?

The Hybrid Noisette is another class of recent introduction. The Ball of Snow, Coquette des Alpes, and Coquette des Blanches belong to this class. The white musk origin is apparent in the pale tints of the flowers. The last two classes are in some confusion and are indiscriminately classed by florists as Hybrid Teas or Hybrid Perpetuals.

But it is easier to find fault, I suppose, than to apply the remedy. It does seem to me, however, that some effort should be made to extricate the most beautiful and charming flower that nature has given us from the confusion into which it has so sadly fallen.

It has occurred to me that roses might be divided according to the character of their bloom into annual, semi-annual, quarterly, and monthly bloomers; but I fear the flowers would not appear at the appointed intervals, as regularly as the sheets of the RURAL, and it might lead to weekly, daily, minutely and secondly roses. This is cutting the year up too precisely for the capricious nature of the plant.

After revolving the matter in my mind for some time I have finally, for my own convenience, adopted the following classifications:

First, I divide all roses under two heads—shrubs and vines or climbers—as all the varities can be readily assigned to one or the other of these divisions, which indicate the habit of the plant. These divisions I subdivide into three classes each, significant of the bloom: 1. Annual blooming roses, or those which bloom but once a year: 2. Periodical blooming roses, or those which bloom at certain periods, more or less defined as the case may be, such as the Remontant and Bourbon Roses; and, 3. Random or Ever-blooming Roses, or those which bloom apparently at will, such as the Bengal and Tea Roses. [I prefer to retain the title "Ever-blooming", as it is a term in common use and pretty generally understood.] This gives me six distinct classes.

First; annual blooming shrubs, which may be designated by the general title of "Shrub Roses," including the Damask, Provence, Moss, French, White, Hybrid Chinese, Hybrid Bourbon and Hybrid Provence, or most of those now classed as "Garden Roses."

Second; periodical blooming shrubs, including the Remontant and Bourbon Roses. If the term "Hybrid Perpetual" must be retained; let it be a title for this class.

Third; ever-blooming shrubs, including the Bengal, Tea, some of the Noisettes, and perhaps also the Macartney and Microphylla Roses, which may be designated under the general title of Ever-blooming Roses.

Fourth; annual blooming climbers, including the Sweet Brier and Hardy Climbing Roses.

Fifth and sixth respectively; periodical and ever-blooming climbers, including the Musk and certain of the Noisettes. I am not sufficiently familiar with the latter varieties to say just which class they should be placed in, nor can I say from my present limited knowledge under what classes the Hybrid Teas and Hybrid Noisettes should come, but I imagine it would lead to a division of these now popular roses.

I offer these remarks as a suggestion to our Horticultural Societies, with a faint hope that they may lead to a better classification of the Rose than we have at present. I think it would be interesting if the RURAL could some time give us a *special* on the Rose.

WM. HEWETT.

[Rosa Canina is never yellow. The yellow tint in many Tea Roses is derived from the original Yellow Tea, introduced from China in the early part of the century (Rosa Indica Odorata). Many amateur rosarians among the fair sex will doubtless echo our correspondent's plaint; however, some study of Ellwanger's excellent text-book, "The Rose," will show the *raison d' être* of our present classification].

GOLDEN GRAINS.

CULTURE is something large and generous, which takes a man out of his narrow specialty and floats him into the deep current of human life.....

FOSTER says an observant man in all his intercourse with society and the world carries a pencil constantly in his hand, and, unperceived, marks on every person and thing the figure expressive of its value, and, therefore, instantly meeting that person or thing again, knows what kind and degree of attention to give it. This is to make something of experience.. .....

HOPE is like the sun, which, as we journey towards it, casts the shadow of burden behind us.. .. ..

THE memory is perpetually looking back when we have nothing present to entertain us; it is like those repositories in animals that are filled with stores of food, on which they may ruminate when their present pasture fails.....

THE way to gain a good reputation is to endeavor to be what you desire to appear.....

EVILS in the Journey of life are like the hills which alarm travelers upon their road; they both appear great at a distance, but when we approach them we find that they are far less insurmountable than we had conceived them..... ....

HE that does good to another man does also good to himself: not only in the consequence, but in the very act of doing it; for the consciousness of well doing is an ample reward...

THE chains of habit are generally too small to be felt till they are too strong to be broken.

THE blessings of fortune are the lowest; the next are the bodily advantages of strength and health, but the superlative blessings, in fine, are those of the mind..... ....

IT is said a wise man should have money in head and pocket, but not in his heart.....

THE hills of lofty endeavor and high achievement lie all around us, and if we never catch a glimpse of the views they afford we need not complain that it is because of the insuperable limitations of our surroundings..... ...

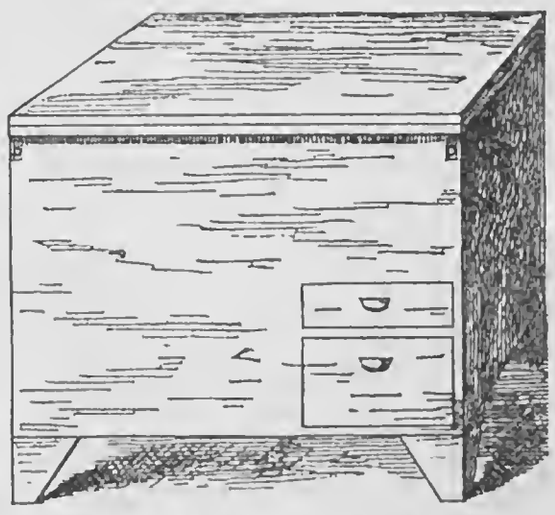
NEWTON says there is inestimable blessing in a cheerful spirit. When the soul throws its windows wide open, letting in the sunshine, and presenting to all who see it the evidence of its gladness, it is not only happy, but it has an unspeakable power of doing good. To all the other beatitudes may be added, "Blessed are the joy-makers." ... .

OUR lives are like some complicated machine, working on one side of a wall and delivering the finished fabric on the other. We cannot cross the barrier and see the end. The work is in our hands—the completion is not....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

The truest homes are often in houses not especially well kept, where the comfort and happiness of the inmates, rather than the preservation of the furniture, are first consulted.



FLOUR CHEST. Fig. 334.

THE above cut shows a very handy flour chest that my mother has. It is 36 inches high, 18 wide and 42 long. It will hold one barrel of flour, one peck of meal and one of buckwheat flour. The solid bottom is six inches from the floor. A partition runs from bottom to top, 14 inches from right end. The smaller space has a solid cross partition just above the drawers. The larger drawer, 14 inches wide, 16 long by 8 deep is for bread. The smaller one, 14 inches wide, 16 long by 4 deep, is divided off into six different compartments.

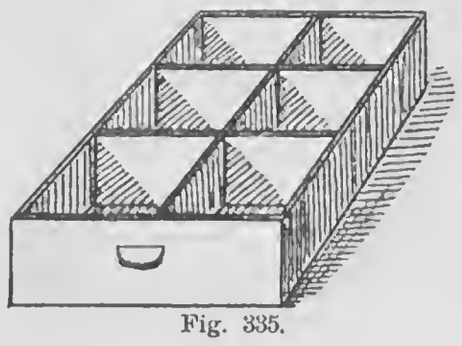


Fig. 335.

There are two covers which are held together by small brass hinges. Strong wooden supports, one inch by two (ends are three inches thick), and length the same as width of chest, run into groves on inside of either end to hold covers when open. The covers are attached to chest by two rods of iron 12 inches in length, with screw holes in ends. One end of each rod is fastened to the front corners of bread board, which is the lower cover, while the other ends are fastened to outside of chest in the middle of sides as far down as they will reach when the covers are in place. To open chest (Fig. 336, pull out the supports—these

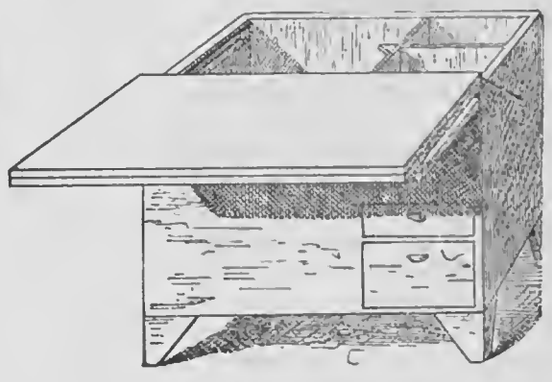

Fig. 336.

should have rings in them for the purpose. Open the first cover and you have a table; the inner cover turned over opens the chest, with bread-board up. If you wish a more solid place for kneading bread, the iron rods permit the covers to be turned upside down over the chest, with bread-board up.

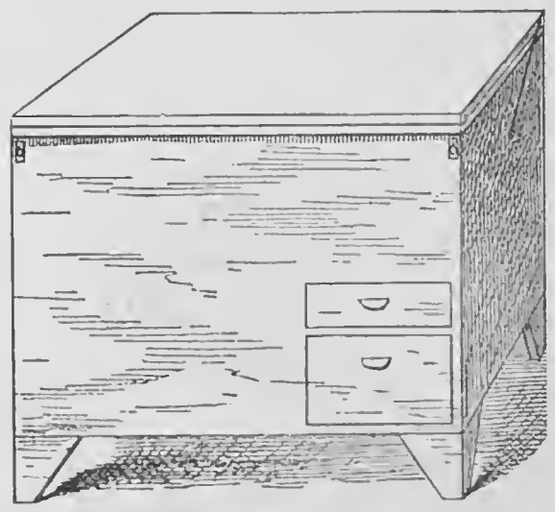

Fig. 337.

Put two small brackets about six inches down on inside for boxes of baking powder, soda, etc. MRS. R. W. WILLIAMS.

HOUSE-KEEPING IN CALIFORNIA.—XIII.

MARY-WAGER FISHER.

On Sundays our church going was chiefly confined to the First Congregational Church. The laddie liked the Sunday school, and never missed either the school or church service. The church edifice was very large and beautiful, and had a membership of nearly 1,000 and 600 children in the Sunday school. There was an orchestra of 12 pieces or so, played by Sunday-school boys, besides the piano and organ. I was always interested in the floral decorations of the altar, which excelled anything I have elsewhere seen—even in Plymouth Church, in Brooklyn. Half a hundred Calla lilies, massed in their green leaves, banks of roses, pyramids of violets, or of French marigolds were no uncommon display at one time, and sometimes only ferns would be used. About 40 Chinese were members of this church, and the pastor said that, taking them all in all, their Christian lives were as creditable as those of white men of their intelligence. When a Chinaman embraces Christianity on the Pacific Coast, it entails upon him a heavy sacrifice. If he is a laundryman he has to close his wash-house on Sundays, and it touches his pocket very deeply. He is also persecuted by his own countrymen, sometimes beaten and imprisoned by them. There is no doubt whatever of the sincere conversion of many of these people, who, in their gentleness of manner, are far more Christ-like than the "Christian white men," who have treated them so brutally. I was told of one Chinaman who learned the English alphabet at Sunday school in Oakland in one hour, so that he could give the name of any letter in any way it might be presented to him—a prodigious feat, truly.

Sunday in California has very few Puritan aspects. True, there are a few people of religious habits, or of aristocratic tendencies, who do not drive on Sunday for pleasure—it is not respectable so to do! The theatres are open on Sunday night as on Monday night—how far they are patronized by Americans I do not know; but there is a large French, German and Italian population which regards Sunday as a holiday, as it is observed in Europe. Boys fly kites in the streets, men have their games of base ball or cricket, venders

hawk their fruit about in the streets, and Sunday is not very different from other days. The morality of the people is lower than that on the Eastern Coast, which is not high enough to boast of, the mercy knows! and if the various so-called labor organizations continue to tyrannize over their members, affairs will grow even worse. In San Francisco, and presumably in other large towns, fathers are not permitted to allow their own sons to learn their trades, and the boys grow up in idleness and swell the hoodlum class. California schools are creditable to the State, but the great need, after all, is technical schools where boys, in particular, can learn trades—how to work. If every boy in the land could have what he should have, it would be a rearing on a farm, and every mother who has her children about her in a country home may well be thankful that their lot has not been cast in the town.

As the days wore on, and our stay in Oakland overran the allotted time, the laddie longed to go home with an ever-increasing desire. One day we went off into the country for wild flowers, and on our return he captured a small bull-frog in a stream, and came shouting after me "Only see, mamma! it is the first bull-frog I have had in my hands since I left home!" and he resisted all my pleadings to let the frog go, as it would soon perish in his hands. "How would you like to be carried off from all your friends?" I asked. "The froz will have friends" came the sturdy reply. "He will find friends and companionship with my tadpoles"—and so all the way until the horse cars were reached that frog was immersed in every mud hole we came to, in order to give him "a taste of his native habitat, mamma." Finally, an old tin can was found, and the frog put in it, in which vehicle he reached the can which held the tadpoles. The acquaintance however, was fated to a short duration, for next morning the boy came to me with "A very peculiar thing has happened. The frog has disappeared and the screen that I put over the can is still on."

During the last week of our camp life, the laddie had an added task which he enjoyed. It was to go for milk, at a house near-by. The occupants kept two Jersey cows, which were brought each night from pasture and led through the cellar into a stable back of the house for milking. It was quite an event to see those cows march quietly through the narrow door that opened into the basement. The milk was excellent, and a great improvement on the country milk which we had previously. It was entirely free from sediment, and although it cost 10 cents a quart, it was cheaper than the other at eight cents. I remember that a young student in Washington Territory took with him into Seattle two cows from his father's farm, and the money he received from the sale of the milk went a long way in defraying his expenses at school. In the parlance of the West, I thought it a capital "scheme." The food for the cows came from the farm, he took care of them himself and delivered the milk. There is always a way to success, and this was his way, and well worthy of imitation.

DON'T neglect to "dress up" a bit in the afternoons.

A DAINTY TOILET SET.

A VERY pretty thing in this line is made from white Java canvas, the mats being cut either oval or oblong, as taste or the shape of the toilet set may direct. A parti-colored design of simple crazy patchwork stitches in fine worsteds of old gold, dark-blue, cardinal, sea-green and pale blue and pink, was very effectively placed in each corner, and a shell stitch of blue worsted with an outer one of pink silk crocheted around the edges. The effect was very oriental, and the time spent in the manufacture should not exceed two hours.

DAISY.

A FARMER'S DAUGHTER'S DOMESTIC REVERIES.

CHARITY SWEETHEART.

I WONDER if all country girls get as tired of the routine of farm work as I do. Sometimes when I see other girls who earn their living easily, all well dressed and having plenty of pocket money, I am "real" envious. I can't help it. I hate my brown hands and the roughness that will come to my fingers from doing all kinds of work. And I know all the time people don't mean it when they say they "admire tan," as some folks do. When Beatrice Bustler comes up to visit us she likes to put her lily-white hands beside mine and show me two sparkling rings she wears that some of her gentlemen friends have given her. Her father works hard and her mother does dressmaking to help keep this only child in idleness and finery. Some people have queer notions of happiness, and I don't think I should enjoy her way of living anyway—picnics and drives and going out nights seem to be all she cares for. Now my way would be to have plenty of books, some pocket-money, a little leisure to enjoy things as they come, and the company of refined, superior people: not all kinds of superior people, however, for there are some that make you feel so ignorant, and speak so patronizingly that it takes away all the pleasure of learning from them. Just as some ministers do when they explain simple terms and treat their hearers as if they did not know anything.

Then I think it would make me very much happier if the boys were a little more tidy in appearance, and more considerate for me. Fancy my having to go out and chop kindlings in the morning—and sometimes after it rains it is not very pleasant—and to light the fire, get water from the spring, and those boys in their beds! Sometimes I half feel like not lighting it, and just doing without; but then there is father, and I can't make him suffer. Oh! if it wasn't for *father*, I couldn't put up with it at all. As Burt grows older, he is more particular with his neck-tie and collar on Sundays, and less particular with his dirty boots, and untidy ways on week days. I can get father to put a coat on to come to meals. It is very little trouble, though his arms are stiff with rheumatism; but the boys will hardly take the trouble to roll down their shirt-sleeves, and as for washing their faces—oh! that is only needed when they go to the village. Burt is awfully particular if there is a chance of meeting Mina Finmore anywhere about. I don't see why farmers' boys need be so careless of their every-day cleanliness, and I wondered very much one day in Spring, when they were hauling manure to the corn-field, and didn't take off their boots when they came in to dinner, if God had deprived them of the sense of smell, or made mine more than usually acute. For after I had worked in the heat preparing the dinner, I could not taste it, but had to go out-of-doors to the pure air feeling deathly sick, while their appetites were unimpaired. When Beatrice Bustler is here, Burt puts on a coat, brushes his hair, and slicks up generally. And why not show as much respect for his sister? I like people and things to be nice, and he knows it, too; and so I get discouraged, and if I say a word, the boys call it "nagging."

Good advice or persuasion is all classed under that term, and if they are found fault with at all, they say, "Oh, we're going off to Montana in the Fall," or Spring, as the case may be. Sometimes I wonder if they would have treated mother so if she had lived. But I don't think it, for boys generally love their mother too well to be rude to her.

The garden is very pretty this year. We have flowers all the time to put on the table, and I am always able to give Burt a pansy or geranium for his button-hole. He is very fond of flowers now, and I think that is a good sign, and if I am sick he is very kind. If I was to die, I am sure he would wish he had been kinder and done more for me; but then that wouldn't do me any good. That's the worst of it. What we want is to be able to give and receive kindness now as we go along life's journey; it helps and cheers one very much. And I often think when I see families flinging satire and sneers at each other, and provoking each other to anger, and sometimes to blows, that if they only knew the future, and what is in store for them, they would spare each other,

"For hearts are broken by harsh words spoken,
The morrow can ne'er set right."

WASHING WITH KEROSENE.

MRS. S. E. D. says she has tried the methods recently given in these columns for washing with kerosene to her entire satisfaction, and that she has thereby been enabled to do washings which she could not have done in the old way.

SUMMER SWEETS FOR WINTER USE.

PINEAPPLES make the most delicious preserves and marmalades for those with whom this fruit is a favorite. Pare the fruit, then hold it firmly by the crown with the left hand, take a large three-tined fork in the right, insert it above the eyes of the fruit, beginning at the base, and pull the separate sections off from the core. This leaves the pineapple tender and juicy, without the core, and is much the best way to prepare it for the table. Weigh the fruit, and allow three-quarters of a pound of sugar to each pound of pineapple. Put in alternate layers in a preserving kettle with a cup of water for every two pounds of fruit. Heat to boiling, and let this process be a slow one; take out the pineapple with a perforated skimmer, and lay upon flat dishes in the sun. Boil and skim the sirup for 20 minutes; return the pineapple to the sirup, and boil all together for half an hour. Take out and put in jars, cans, or bowls, filling them two-thirds full, thicken the sirup by simmering for 15 minutes longer, and pour over the fruit, covering it to keep in the heat. When cold, cover with tissue paper wet with brandy. Paste stout paper over all, or you may seal up at once in self-sealing jars. For a rich preserve of this kind the small pint jars are the best size.

For pineapple marmalade, select well ripened fruit, but without decaying spots. Pare and grate with a coarse grater or mince with a chopping knife, leaving out the core. Allow a pound of sugar to every pint of pineapple. Make a sirup by adding a cup of water to every two pounds of sugar. Boil and skim. Put the fruit in a porcelain-lined vessel closely covered, and heat by setting it over the fire in a large pan containing boiling water. When it is smoking hot all through, add the sirup and boil all together until it is a clear light-colored, almost white paste, stirring almost constantly with a wooden spoon. It will take from half to three-quarters of an hour. Glass cans or tumblers are always preferable to china bowls for preserves and marmalades, as you can see the first signs of fermentation.

Watermelon rind makes a very unique preserve, pleasing to both the eye and palate. The large dark green melons with the thick rinds make the best. Peel off the green skin and cut the rind into strips or fanciful shapes; throw into a large vessel with cold water, and let it stand for 12 hours, changing the water four times. Drain and weigh. Use four lemons, a quarter of a pound of white ginger root, and six pounds of sugar for six pounds of rind. Wrap the ginger in a muslin bag and boil in a quart of water until the water is highly flavored; put in the sugar and boil until no scum arises; put in the pieces of the rind and the lemons which have been peeled, sliced thinly and the seeds removed, and simmer gently for an hour; take out the rind and lay upon dishes in the sun until firm and almost cool: put back into the sirup, simmer half an hour, spread out again and when firm pack into cans, pour over the boiling sirup and seal. In preparing the lemons for this sweetmeat, peel them with a very sharp knife, and take off first the very thin yellow rind; par-boil this and then add it to the sirup with rind. It adds greatly to the flavor and beauty of the sweetmeats.

PALMETTO.

Miscellaneous Advertising.

Pain in the Side

Is a symptom of disease. It may be caused by Rheumatism, or by Neuralgia, but it usually indicates a disordered condition of the Stomach, Liver, or Kidneys. Ayer's Sarsaparilla corrects the action of the vital organs, and removes every trace of disease from the system.

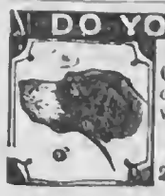
Last fall and winter I suffered from a dull, heavy, pain in my side. I did not notice it much, at first, but it gradually grew worse until it became almost unbearable. During the latter part of this time, disorders of the Stomach and Liver increased my troubles. I began taking Ayer's Sarsaparilla, and, after faithfully continuing the use of this medicine for some months, the pain disappeared and I was completely cured.—Mrs. Augusta A. Forbush, Haverhill, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.



DO YOU WANT A DOG?
DOG BUYERS' GUIDE.
Colored plates, 100 engravings of different breeds, prices they are worth, and where to buy them. Mailed for 15 Cents.
ASSOCIATED FANCIERS,
237 S. Eighth St. Philadelphia, Pa.

"The Farmer will find that thorough cultivation of wheat ground is manure, and that each of his teams earns $10 each day they are thus employed." If this is true, how important it is that the farmer should use proper implements for the purpose of pulverizing the soil. See advertisement of the "ACME" Pulverizing Harrow, Clod Crusher and Leveler on page 556.

CARMAN RASPBERRY This NEW Extra Early Black Cap is now offered for Sale, and is likely to work a REVOLUTION in in market growing. VERY PRODUCTIVE. Fruit of **largest size, Jet Black**, and the **earliest** *of all to ripen*. Sells at highest price. **Best** quality for family use. Also **EARHART** Rasp., a valuable novelty—fruits from June to Nov. Pot STRAWBERRIES and all best varieties Small Fruits for Fall planting. Cheap for choice stock. Circulars free. **Hale Bros.**, South Glastonbury, Conn.

HAND PICKED SEED. **DIEHL-MEDITERRANEAN.**
The hardiest, best yielding and milling Wheat grown. Seed hand-picked and strictly pure. For sample heads and prices, address, with stamp,
H. M. JAQUES, Wright's Corners, N. Y.

NEW STRAWBERRIES Summit, Covill's Early, Bubach's No. 5, Belmont, Lida, Jewell, Ontario, Sunapee. Send postal for history and description, to
M. CRAWFORD, CUYAHOGA FALLS, O.

Diehl-Mediterranean Seed Wheat.
Raised from seed purchased of the originator, for sale at $1.50 per bushel; bags, 20 cents. Address
A. H. LYTLE, DERBY, ERIE CO., N. Y.

SEED WHEAT.
Pure DIEHL-MEDITERRANEAN, from the Originator. Best Wheat known. $1.25 per bushel; bags, 20 cents. Address Walter O'Dell, SOMERSET, MICH.

SEED WHEAT
And How to Grow It or Thirty Years in the Wheat Field.
Giving the origin, history, and description of the different varieties of wheat, the best and most popular modes of cultivation, **with samples of five** of the most hardy and productive kinds now grown in this county. All sent on receipt of **10c.** in postage stamps or money. Address SAMUEL WILSON, MECHANICSVILLE, BUCKS CO., PA.

1838 **POMONA NURSERIES** 1886
Established 1838.
POT GROWN STRAWBERRIES.
Parry, Lida, May King, Henderson, Jewell, Belmont, Bubach, and Ontario ready for immediate shipment. Other varieties potted to order. Send for catalogue, with testimonials, etc. Also of **Lawson & Kieffer, Marlboro & Golden Queen, Erie & Wilson Jr., Niagara & Empire State**, etc., etc.

Hatches Ducks, Turkeys Geese and Chickens. Received First Premium where exhibited. Send for Circular.
ANDREWS' **Hatcher Co.**
Elmira, N. Y.
Mention RURAL N. Y.

INVENTORS and MAN'F'RS. Send for large pamphlet containing U.S. PATENT Office Rules for obtaining Patents. F. B. BROCK, Atty., Washington, D.C.

News of the Week.

HOME NEWS.

SATURDAY, August 14, 1886.

THE import duty on canned mackerel has been raised from 20 to 100 per cent. ad valorem by the local custom-house authorities at Boston. The case is to be appealed to the Secretary of the Treasury. In view of the small catch of mackerel by American fishermen, this is an important matter. It is a blow at Canadian fishermen and at American fish consumers.....For some weeks there has been a strike or lockout at the immense pork-packing establishments of John B. Squires, at East Cambridge, near Boston. The men wanted better terms; and Squire would not tolerate the K. of L. or any other labor organization, as they were likely to ruin his business by frequent strikes and incessant growling. The men (about 4,000) all returned to work Tuesday last on better terms; but they had to treat not as an organization, but individually, so Squire gets all he wanted, and the men nearly all they wanted...The Standard Oil Company has leased 2,000 acres in Northern Pa., extending along the natural depressions from Corry to Erie—a part of a scheme to monopolize all the available gas and oil lands in the country..... Of the Canadian Volunteers against Riel only about 900 have taken land warrants entitling them to 380 acres of land in the Northwest territory, while 3,500 have preferred to take scrip worth only $80. Nearly 1,000 of those entitled to scrip or warrants have appeared for neither. The issue of land warrants closed on July 31; but the men can still take scrip..... .....At the annual session of the Grand Army of the Republic at San Francisco the other day, a resolution in favor of pensions for all surviving soldiers of the late war was voted down by a majority of four to one, as a similar motion had been at the meeting of last year.....Workingmen have no reason to find fault with the session of Congress just ended. It passed every labor measure presented to it. It passed an arbitration bill, it prohibited the importation of contract labor, prohibited the contraction of contract labor in Federal prisons, and ordered an investigation of convict labor in the prisons of every State and Territory, as a basis for future legislation ....Of the 4,000 men who went on a strike on the Gould system of railroads in Missouri, it is said that only 200 have been re-employed ....A rich oil belt has been discovered at Livermore, Cal....It is said large numbers of Chinamen are continually entering the United States over the Mexican border, in violation of the law...Arrangements are being made at the Treasury Department for a large call of bonds in a few days, in addition to the usual monthly call of $4,000,000 to meet the requirements of the sinking fund. The amount will probably be $10,000,000....In an election, Tuesday, Jackson, Miss., gave 300 majority against prohibition, but the county was carried by the Prohibitionists by 800 majority. That's the tale nearly everywhere—the towns vote for rum or high license; the country for local option or prohibition..... The Audubon Society was duly incorporated under the York State laws last Saturday..... ....The Blaine fight against Edmunds in Vermont, in spite of the late declaration of the Republican State Convention in the latter's favor, still continues. Nominations for the Legislature are now being made—for 30 Senators and 240 Representatives—and the Blaine-Smith men are doing their level best to secure anti-Edmunds nominations. Edmunds still ahead, however.....In Tennessee, the Republicans nominated the Hon. Alfred Taylor for Governor on June 15, and Thursday the Democrats nominated his brother, Robert L. Taylor, now Pension Agent at Knoxville, for the same position, while the Prohibitionists propose to nominate the father of both these men as their candidate. Good for the Taylor family!..... ..... Japan having recently voluntarily surrendered a fugitive from justice to the State of California, the American and Japanese Governments have negotiated a very complete extradition treaty, which was sent to the Senate by the President June 9. The treaty was negotiated by ex-Gov. Richard B. Hubbard, of Texas, our Minister to Japan, and Count Inouye Kaoru, the Japanese Minister of Foreign Affairs. This is the first extradition treaty ever negotiated between an Asiatic and a civilized power, and marks the highest advance yet proposed by our Government, which has always been highly favorable to extradition .....The law requires the Treasury to purchase each month $2,000,000 worth of silver and coin it into as many silver dollars as it will make. In June, the average price paid for silver was 98.77 cents per ounce, and $2,000,000 worth of silver produced in silver dollars $2,617,981. This gives an intrinsic value per dollar of 76.42 cents. The intrinsic value of a $10,000 greenback, however, is a mere trifle; but the credit of the United States makes it worth its face value in gold—so say the "silver men."..... The National Association of prisoners of war meets at Buffalo, August 18 and 19. It is claimed 100,000 were at one time or another prisoners. Only 22,000 survive; of these, 11,000 can't get pensions. 46,000 are said to have died of exposure and starvation..... The people of Georgia, in the October election, will be called upon to vote on a constitutional amendment authorizing the Legislature to pension Confederate soldiers ....The President signed the River and Harbor Improvement Bill on the ground that the amount, $14,473,000 was moderate, being the smallest for some years, and upon the assurance of Gen. John Newton, the Chief Engineer, that if the appropriation failed, it would require $500,000 to keep important works from deteriorating. Gen. Newton assured the President that all the appropriations in the bill were for meritorious works, except perhaps in the case of 18 items, for which the sum total did not exceed 1 per cent. of the whole appropriation. Others do not agree with this view, but anyhow it has lately become too much the custom to vilify Congress and those in executive places for nearly everything they do or do not do ....Daniel Magone, of Ogdensburg, N. Y., 55 years old, of Irish descent, and a lawyer by profession, has been appointed Collector of Customs at this port to succeed Hedden, requested to resign—one of the most important appointments in the whole country owing to the immense amount of patronage at the disposal of the Collector Prof. Foster, meteorologist, Burlington, Ia., predicts that one of the greatest storms in 1886 will begin August 16 and continue till August 27, during which time the great drought will be broken by heavy rains, hail, tornadoes, and heavy gales. He predicts a tropical hurricane on the southeast Atlantic coast between the 16th and 20th. These storms will be general, and Iowa, Illinois, New England States, Eastern Canada, and Labrador will lie in the danger path. Vivid sun-spots are predicted from the 18th to the 20th, and brilliant auroras on the 20th and 23d Has the Union as well as the Dominion a Wiggins?..... .....Ex-Gov. W. Stevenson, of Ky., died at his home in Covington, the other day, aged 73. Had been an able lawyer, member of both branches of the Legislature, Lieut. Gov., Gov., Member of Congress and U. S. Senator..... ....Very likely Sec. Manning will resume his official duties in Oct.—steadily recovering.... ....The Prohibitionists of N. C. are about to nominate a State ticket.....The anti-riparian party which induced Gov. Stoneman to call the extra session of the California Legislature has failed to carry one point in its program—the Legislature refuses to re-organize the Supreme Court. It is hoped to secure relief from the Court's decision by special legislation..... Geronimo and his Apaches are being hard pressed by Capt. Lawton's pursuing force in the Sierra Madres Mountains. One of his roving bands recently attacked a wagon train near Ures, Mex., and killed the Mexican teamsters and two wood choppers. The country for miles around has been terrorized by his depredations. The Mexican troops are co-operating with the American forces in pursuing the hostiles..... .....Samuel J. Kirkwood, the "War Governor" of Iowa, has consented to become a candidate for Congress in the Second District of that State.... .....Leading Knights of Labor are discussing the propriety of reorganizing the management of the order. The plan most favored is to give Mr. Powderly, or whoever may be at the head, the privilege of selecting the members of the General Executive Board. The matter will be considered at the Richmond convention in October. Here the K. a fortnight ago ordered out all the trade union cigar makers who refused to give up their Unions altogether and become Knights exclusively. Some belonged to both Unions and K., but all—over 5,000 "went out" as the manufacturers preferred to deal with the K., who promised to fill the places of the "outs." This they have been unable to do, and the Unionists are returning to work on their own terms. In a great number of other cases also the K. are getting the worst of it; for of late the "striking" and "boycotting" faction has been coming prominently to the front, and employers and public are getting "tired" of their tyranny. After all, if public opinion is against them, their ultimate ruin is certain... Editor Cutting is still in prison at Paso del Norte. He is held for circulating the libel in Mexico, not for printing it in Texas. He has been sentenced to a year's imprisonment and a fine of $600, with 100 days' extra imprisonment if it isn't paid. His record is by no means a good one, and it's a pity such a fuss should be made over a fellow of that sort. The Chief of Police at Piedras Negras has been acquitted for the killing of Rasures. It seems he was given in charge of a deputy to be carried up country, tried to escape and was shot. It is now alleged he was not an American citizen; but he was well known as a horse thief and a worthless desperado. Very contradictory reports from all along the border about almost everything. A great deal of excitement along the Rio Grande and Texas, and volunteers offering themselves "for the war," from Buffalo to San Francisco. The Southern States, especially Texas, are hot for hostilities. Not much fear of war, however, unless the countries are dragged into it by border adventurers, speculators and desparadoes. European and American speculators in Mexican lands and mines would make millions by the appreciation of property they bought for a song, if their section of Mexico were annexed to the United States, and they are trying to bring that about. The Mexican Government is acting well, and in any case arbitration must be tried before war..... .....Mrs. Robinson, arrested at Somerville, Mass., on a charge of poisoning her son, is now suspected of having caused 100 deaths during the last four years, including husband, children and other members of her own family. The insurance on their lives, in which she was interested, was generally the cause... ...A portion of the New Orleans Exposition Building, falling, killed one man and seriously injured others, yesterday.....Cardinal Taschereau, of Quebec, has sent a circular letter to the bishops of his Province announcing that the Roman See has finally condemned the Order of the Knights of Labor..... ..... Secretary Whitney has ordered the construction of the most highly powered cruiser in the world..... .....The long drought in portions of the West was yesterday broken by a storm that did much damage to property and worked serious injury to the crops. .....A telegram as we go to press says the forest fires in Michigan and Wisconsin are abating.....

FOREIGN NEWS.

SATURDAY, August 14, 1886.

FROM last Saturday to Thursday, very disastrous riots raged in Belfast. There have been 42 known deaths, and over 300 people have been treated for severe injuries in the hospitals, besides a great many more at their own homes. The number of deaths and injuries will never be known, as both parties, whenever possible, hide their misfortunes, as the knowledge of them would gratify their opponents. The town has about 175,000 Protestants to 50,000 Catholics; but though the former are undoubtedly most to blame, both parties are at fault. In addition to the late reinforcement of constabulary, 500 fresh policemen have been sent there from other parts of the island. The reinforcements are chiefly Catholics, and the Belfast Protestants hate them worse even than they hate their Catholic fellow-townsmen. Over 5,000 troops patrol the town, disperse mobs and try to keep the peace. Government is to make inquiry into the trouble. The Magistrates are 37 Protestants to 11 Catholics, and the majority decides, and Catholics say they are treated very unfairly..... .....In England Parliament has been prorogued to September 19. Lord Salisbury intimates coercion for Ireland. The Conservatives are preparing a Home Rule Bill for England, Ireland, Scotland and Wales, leaving each to take care of its own legislation, while the General Government will act like Congress here. The federation of the United Kingdom and all its colonies is gaining headway, and this is a move in that direction..... ....When a Member of Parliament accepts office under Government he has to be re-elected either by his former or some other constituency. All the Conservatives who took office have been re-elected without opposition at the polls.....Cholera is growing more violent than of late in Italy. At Trieste 17 new cases yesterday and five deaths; 131 new cases and 63 deaths at Barletta; 36 new cases and nine deaths at Ravenna, and 61 new cases and 30 deaths in other parts of the country..... The Emperors of Germany and Austria-Hungary have had a three-days' interview at Gatsein, but the Emperor of Russia was absent, and Russia is very much displeased because Germany backs up Austria in checking her designs on Constantinople, and war may show her displeasure at no distant day.....

AGRICULTURAL NEWS.

SATURDAY, Aug. 14, 1886.

ACCORDING to the Alexandria Produce Association's Report, the cotton and corn crops of Egypt are an average, but two weeks late owing to the lowness of the Nile..... .....The Canadian Government is to make a collection of the best early autumn fruits and vegetables for the great Colonial Exhibition now delighting and instructing London and the rest of England. The first shipment will be made Sept. 23, from the Industrial Show at Toronto, and the Horticultural show at Montreal. The second shipment will be made Sept. 30, from the Provincial Fair at Guelph, and the Dominion Exhibition at Sherbroke. All the English papers are enthusiastic over the magnificent display of raw and manufactured mineral and vegetable products made by Canada at the Colonial and Indian Exhibition—the Colonind, as it called, for short. .....The Winnepeg Packing and Provision Company has applied for incorporation. It is to go into the pork and dressed beef packing business, and wants a bonus of $10,000 from Winnepeg for starting there—entire capital, $75,000. Unless a packery is started there soon, some other place is likely to get ahead, as there will be plenty of stock soon in the Canadian Northwest.....According to carefully prepared estimates, the sugar crop of Cuba amounts to 661,697 tons against 631,967. Bad weather spoilt the June estimate of 700,000 tons in '85.....Pleuro-pneumonia has appeared among another herd of cattle in Manor Township, near Lancaster, Pa. Dr. Bridges, of Philadelphia, State Veterinarian, Wednesday killed four head on the farm of Cyrus Mann and inoculated the remainder of herd. The other herds infected are improving. ....Up to date fully 3,000 cattle belonging to intruders have been driven from the Chickasaw Nation, Indian Territory, by the police. A large number of intruders who made a pretense of selling to the Indians to enable them to keep their stock in the country have been compelled to take their herds and go. The Indians who attempted to shield them have been placed under arrest..... .... Commissioner Colman has appointed his predecessor, the Hon. George B. Loring, of Massachusetts, to represent the United States at the exhibition of the American Percheron Horse-breeders' Association in Chicago, September 6.....Wily farmers in Litchfield County, Ct., it is alleged, are having more than two tons of oleomargarine sent them from New York every week to be used in adulterating butter.....Rainy weather in Russia is rotting the grain in the fields, and the crop outlook is bad... .... For 15 points in the West and Northwest, the records of the Signal Service show an average of 6.53 inches of rainfall during May, June and July of this year. The average of the same points for 11 years past, is 12.52 inches for those three month. The supply of moisture this Summer, thus far, has been but very little more than half the average of the season. .....The watermelon crop of the South will hardly be very profitable this year. Last year's crop was very profitable, and a large increase was made in the area; hence the oversupply now, and melons often don't pay freight and charges. South Carolina alone is expected to send over 3,000,000 melons to this city, besides loads to the West and other sections..... ... The wheat crop of France is estimated at 106,000,000 hectoliters against 210,000,000 in 1885'.....

Restoration of Hearing.

Do you hear well? If not, it will be interesting to read what several patients have to say of how their hearing was improved:

A gentleman in San Francisco, Cal., who had for a few months used Compound Oxygen, wrote as follows: "My left ear had always been to me a useless organ. Yesterday I made several prolonged tests on the telephone. Although formerly I had been unable to hear at all in that ear, *I am now able to hear in it* more distinctly than in my right ear."

A patient at Indianapolis, Ind., writes: "I have used three-fourths of the Compound Oxygen you sent me, and have derived much benefit. My catarrh I think about cured, and *my hearing has also been benefited.*"

A physician of Shreveport, La., says: "Compound Oxygen is the best remedy I have found for my troubles. To first time I used it I was relieved of a very severe catarrh trouble, which kept me awake all night. My *defective hearing has been very much improved* and my lung trouble promises to be a thing of the past."

A gentleman in Des Moines, Ia., writes: "Compound Oxygen has improved my general health. The periodical *attacks of deafness are not so frequent* nor so long continued."

A Virginia physician writes: "*My wife* has been for twenty-five or thirty years deaf in one ear, and under the use of the Oxygen *can now hear well.*"

"Compound Oxygen—Its Mode of Action and Results," is the title of a work which gives a full and interesting explanation of what may appear mysterious about this remedy, and also gives letters from patients cured

of various chronic diseases. It is furnished free to any address on application, either personally or by letter, to Drs. STARKEY & PALEN, 1529 Arch Street, Philadelphia, Pa.—*Adv.*

Crops & Markets.

SATURDAY, Aug. 14, 1886.

The visible supply of grain August 7, as compiled by the New York produce exchange, was: Wheat 36,752,874 bushels, increase 2,095,910; corn 8,695,346; decrease 545,813; oats 2,021,231, increase 266,457; rye 420,847, increase 49,311; barley 252,884; increase 25,996.

The Department of Agriculture at Washington reports that the spring wheat returns for August show an improvement in condition in Iowa, a small decline in Wisconsin and Nebraska, and a heavy reduction in Dakota The causes of deterioration are drought and chinch-bugs. Heat has been excessive in many districts that have produced a fair yield not withstanding. The harvest is two weeks earlier than usual, and the quality is unusually good, except in sections where heavy loss from blight has occurred. The average has been reduced from 83.2 to 80.1, while last year at the harvest the average was 86. Iowa's present average is 97, and no less than 25 counties, each producing from 200,000 to 1,000,000 bushels, report the condition at 100 or over. In Minnesota there is an increase from 78 to 80. The reduction in Wisconsin is from 75 to 72; in Nebraska from 83 to 82, and in Dakota from 85 to 62. The condition of corn has declined heavily in Illinois, Wisconsin and States west of the Mississippi since July 1. In the Eastern and Middle States the condition is well maintained. The general indications point to a crop of 22 bushels to the acre. The average of spring rye is 88. There has been no material decline in oats, the average being 87. Barley has maintained its condition, and a nearly average crop is assured. The condition of buckwheat averages 94, of tobacco 82, of potatoes 88. The cotton crop has suffered from wet weather in all States east of the Mississippi and in Louisiana. The average of condition had been reduced from 86 to 81; Virginia 75, North Carolina 74, South Carolina 67, Georgia 80, Florida 86, Alabama 77, Mississippi 79, Louisiana 75, Texas 88, Arkansas 96, Tennessee 95. There has been a slight advance in Arkansas and Texas. The decline is heavy in the Carolinas. The Government's London agent telegraphs that the European harvest will be 10 per cent. less than last year.

THE Cincinnati Price Current of Thursday says in Kansas the general outlook for corn has been improved by rains. Nebraska continues to give a poor promise. In Iowa scarcely any locality promises over three-fourths of a crop. Missouri is more variable, but not averaging over three-fourths of a crop. Some rains have fallen in Illinois, but the situation remains poor, averaging two-thirds of a crop. In Indiana there will be but little short of an average yield. Ohio generally fairly good. Michigan somewhat short, Kentucky nearly an average and Tennessee rather poor in condition of crop. These States represent 75 per cent. of last year's production, and if present indications are fulfilled will be about 77 per cent., compared with last year. This means a total of 1,115,000,000 bushels for the 10 States, or an average of of 23½ bushels per acre. The remaining portion of the country is in fairly good condition; 450,000,000 bushels, or 10 per cent. below last year, closely approximates the promise of this portion of the country. This implies less than 21 bushels per acre as a general average for the whole country.

The Price Current calculates the exportable surplus of wheat this year from the Atlantic division of the country at 70,000,000 to 75,000,000 bushels, and for the Pacific division approximately, 50,000,000 bushels, as available during the year now opening in excess of domestic requirements for consumption, seeding and reserves.

Telegraphic advices from Winnipeg, Manitoba, on the 11th, concerning nearly every station in the Northwest, indicate that the wheat harvest is already well advanced, and that it will be nearly finished during the week. All reports agree as to the superior quality of the crops, though the average yield will likely be under 20 bushels per acre. Good for the Dominion!

Other reports from Ontario, Canada, say there has been exceptionally fine harvest weather in Western Ontario, and already the bulk of the fall wheat and barley has been housed in excellent condition. Thrashing has commenced, and from reports received both the samples of wheat and the yield are all that could be desired. Some few fields of early oats have been cut, but generally speaking they are light in the straw. Spring wheat is ready for the reaper. The hay crop has been harvested in the finest condition that was ever known, as the majority of that cut hardly got a sprinkling of rain. One week more will see the grain harvest pretty well through with in Ontario—one of the earliest remembered.

A special from St. Paul, Minn., on the 12th, says: Scattering reports from the Southwest of the State, where some thrashing has been done, are generally encouraging. In many places in the James River country, where the crop was supposed to be very badly damaged, wheat is turning out fairly well. It is now apparent that the crops in the immediate vicinity of Millbank are damaged about 50 per cent. by the hailstorm of a month ago. Around Ortonville, the wheat will yield 12 to 13 bushels. The quality is good, as there is no smut this year. Around Webster, Dakota, wheat will yield 15 to 19 bushels of excellent quality; oats about 30 bushels. Along the Fargo southern crops are turning out very well, and the yield of wheat and oats will be about an average. In Watonwan County thrashing is well under way, and the quality and yield of grain are better than expected. Corn is maturing rapidly, and is in a fine condition. Some farmers about Shakopee are already thrashing, and report the yield perfectly satisfactory, one man obtaining 26 bushels per acre on a 10-acre field. The weather is very dry, and the chinch bugs are damaging the corn to a considerable extent. It has been reported that Walsh County, Dakota, will not raise half a crop this year.

LATEST BRIEFS.—Fears of serious effects from the drought are stiffening corn prices. The actual yield of spring wheat appears to be in excess of the quautity lately anticipated. Cotton is doing well in Arkansas, Tennessee, and the eastern cotton belt, except Alabama, where worms have done some damage. In Texas the hot weather continues, and has caused shedding. Rain is still needed in some sections of the western tobacco region. Special hop crop reports to Bradstreet's point to a probable total crop of 65,000 bales in the United States, 20,000 bales in New York State, and the remainder on the Pacific Coast. Old hops on hand aggregate 120,000 bales, and the probable consumption the coming year is placed at 140,000 bales. The old hops are of very poor quality. Sugar is again lower in price, owing to heavy supplies in sight.

After two months of advancing, followed by firm prices, without material change, the wool markets begin to show symptoms of weakness. Takings by manufacturers have been very moderate for some days past, and sales have occasionally been made at small concessions on the terms which were strenuously insisted on earlier in the month. Reaction will probably not be lasting.

MARKETS BY TELEGRAPH.

SATURDAY, August 14, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 1½c. higher; No. 2 Spring, ½c. higher. Corn, 1½c. higher. Oats, ¼c. higher. Rye, 1c. lower. Barley, ½c. lower. Flaxseed, 2c. higher. Two Hundred Thousand Farmers in the United States know from practical observation what the "ACME" Pulverizing Harrow, Clod Crusher and Leveler is—how efficiently and cheaply it does the work—and how its use increases the wheat crop by thoroughly pulverizing the soil. The remaining farmers should post themselves in reference to this valuable implement.—See advt. on page 556,

For the Young.

I NEVER yet saw a boy who liked to turn the grindstone. I have known boys to run and hide when the tools wanted sharpening. They were always found out, though, and made to work harder than ever. Whenever the hired man has a spite against the boy he likes to get him to turn the grindstone. By bearing down hard on the axe or scythe, the work is made a great deal harder than it otherwise would be. Whenever I see a hired man doing that, I want to see him served as I once saw one served. He was "bearing on" as hard as he could, when the axe slipped and his finger went up against the stone. The skin on his finger was well ground off, and he had to go light for a while. While grinding is about as hard work as any on the farm, the tools cut enough better for the sharpening to pay for the extra work. Sharp, clean tools are what we want on our farms. We are going to have them when we have farms of our own. Remember that your hard work at the grindstone counts towards good crops as much as anything you can do. You may not get much credit for the work, but the help is there, just the same.

YOU remember the story Franklin told about the man who wanted him to turn a grindstone? Franklin was a boy, going to school, when he met a man who called him a "smart boy," and wanted him to take hold of the handle and turn, just to show how smart he was. Franklin turned like a good fellow, proud enough at this praise, while the man put his axe on the stone and sharpened it well. When the axe was done, the man stopped and said: "Clear out, you little rascal, or you'll be late to school." Now, when we see a person coming about very polite, and praising our work, we are apt to say he has "an axe to grind," that is, he wants to get us to do something for him. Look out for the people who do nothing but praise you. They are poor friends. I always want my friend to tell me what my faults are, and not praise me to my face and then go and tell somebody else how foolish I am to believe what he says. When you pick out your friends, avoid those who have nothing but praise.

SOME people have queer notions. When I was a boy they used to tell me that if I ate milk and cherries, or milk and lobsters, or milk and tomatoes I would be poisoned. I thought it was so. I can remember that in all our neighborhood, people never dared to drink milk after eating any of these three foods. They just believed what had been told them. One year a man came in from another town. He went up into a cherry tree and ate all the cherries he wanted. Then he came into the house and saw a bowl of milk on the table. Being thirsty he drank it about all up. Then there was a great commotion. Everybody supposed he would be dreadfully sick. But he never was sick, and people gradually found out that they had been deceiving themselves for years about food. They had taken for granted all that people had told them, without trying to see for themselves whether things were so or not. Our minds were given us to reason and think. We must not settle that a thing is so just because somebody else says it is. Things that we prove for ourselves are worth twice as much as things somebody else proves for us.

I ALWAYS feel sorry for a boy who has a "cow lick." I have seen some bad ones. The hair *will* stand up straight, in spite of all the combing and brushing you may do. There is no use getting discouraged about them, for they are sure to go down in time if you will only persist in combing and brushing the right way. Keep at them and brush them down.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

AFTER a long walk over the muddy roads, which ran for most of the way through the woods, I came to a brick schoolhouse which proved to be my "institute." There was a general air of decay about it. The bricks appeared to be weak and discouraged. At the corners of the house they were in tears—crumbling away. Several of the windows held broken panes of glass. The doors were stained and cracked. The sills were worn flat to the floor. A broken fence surrounded the yard. A large belfry had crowned the structure, yet no bell had ever been placed there. The whole premises showed the marks of neglect in every feature.

A large house stood directly across the road from the school house. I was somewhat surprised to see my satchel lying upon its side directly in front of the gate. I judged from this mark that I had reached the director's house. I pushed open the gate and walked up to the front door where a large, pleasant-looking man sat reading a paper. As he saw me he rose and came out to meet me.

"Ah! my worthy young friend, the teacher, I presume? Proud to greet you sir—proud to greet you. Excuse me for not offering my card. Since I came to live in this abode of wild beasts, sir, I have not been able to continue many of the usages of refined society; but I treasure them in memory, sir—I treasure them in memory. I recognize in you, sir, a friend in need—a brother in misery. Your misery has not yet begun, sir, but it will come upon the stage 'ere long. Walk in, sir."

We went inside where I met the rest of the family. I was tired after my long walk and gladly accepted a seat in the old-fashioned parlor. I had little need to talk. The director seemed like a man who had been kept silent for a long time and who now found a chance to liberate his voice.

"I came out from the city six months ago. This place belongs to us, and as it was running down I determined to see if I couldn't bring it up. I don't know anything about farming, and these hounds seem to appreciate the fact. If I go to them for advice they deliberately lie to me and do their best to make me go wrong. The society here is so far below the standard that the standard has closed over it. There is only one thing that would start out a crowd here, and that is a dog-fight. They elected me director—what they did it for I don't know—and I'll show them before I get through what a director is. They have built up the worst school in this part of the State. It is the direct result of their system of doing business. When one side gets a teacher in, the other side just makes it a business to get him out, if they can. We haven't had a good school for the past 10 years, for this very reason. The young folks here show the result of it. Now I'm in this office and they can't put me out. I want you to back me up in this matter, and we'll clear things up. We want reform, and you are just the man to start it."

In the evening, Messrs. Hardhack and Mouser came over to make the final arrangements. They walked solemnly in and took seats by the fire, keeping their hats on, as if afraid that some of the demoralizing influence of the Forest family might enter their heads unless well protected. They looked at each other and shook their heads sadly, as we laughed and talked over the meal. No such levity was to be allowed at their tables. Eating was a solemn business with them.

"We don't want no fancy teachin' in this decstrict," said Moderator Hardhack, after the School Board had adjourned to the parlor. "We aint got no call fer all this here grammar, history and sech like. Jogerfy's all right 'nuff, but cyferin' gits ahead of 'em all. Ye wanter learn them boys so'st they kin git the pitch to a ruff, how to figger interest and git the number of foot in a log. We aint never gonter make no presidents uer no ministers to Bear Crick; they aint no timber fer it, an' I aint in no favor of spilin' good farmers by runnin' truck inter 'em. Them's my idees—what's yourn?"

Mr. Mouser, who had been selected to care for the finances of the district, gave his opinion next.

"I don't want spellin' crowded out. Spellin's a big study. You take a good speller, an' he can go anywheres an' stand up 'longside of any of 'em. I used fer ter be a boss on spellin' myself, when I went ter deestrict school. Whenever I went out to a spellin' school, I was the bell weather, an' got me a seat by the fire every time. I don't want spellin' froze out. Anything that boosts a feller up amongst folks, and puts him on a high seat, wants ter be cosseted. Spellin'll do it, I'll lay a hoss."

A KANSAS VIEW.

DEAR UNCLE MARK: Long ago I sat down to tell you all about an afternoon I spent on the prairies, which seemed more characteristic of Kansas than any one of the pleasant outings I have had.

It was a bright Saturday in May when the good uncle came in the big wagon to take another of the ladies here and myself for our first experience on the open prairie. We went to Burnett's Peak, commonly dubbed "The Mound," which on a clear day may be distinctly seen some five miles to the southwest, but to reach it we must cross the river and so pass through Topeka, which takes us some miles out of a due course. There were six of us, or seven, if I include the very important factor, a big jug of water. Right merrily we rattled off, the three small boys and their older companions all in the best of spirits. It seemed a little windy when we started and by the time we had ridden seven miles through city and country there was no room to doubt that it was a windy day. When we were fully a mile from the great green mound it rose before us so distinctly I am sure that a man on the highest point would have stood out plainly against the sky. A more lovely day to enjoy a view of Kansas could not have been had for the air was remarkably clear, the sky cloudless. About half a mile from the mound we turned off the road and drove for a short distance across the treeless prairie, then hitched the team to a fence at the base of the mound, and began our ascent on foot, which proved more of a climb than I imagined Kansas could afford. There is a much worn path to the summit, for no one who takes in the city of Topeka is well informed unless he visits Burnett's Peak. Pansy, among other notables has stood there and seen "the whole State of Kansas," which indeed seems little exaggeration of the truth. It was so windy when we reached the top that our only safety lay in dropping flat to the ground and holding on to some one of the many huge stones which in this rockless country are one of the many features of the mound.

I cannot describe the view which met my eyes when once I was firmly enough seated to pay attention to something besides my feet. I presume the least distant point of the horizon is 20 miles, while toward the east I would venture to guess 60 miles as the limit of vision. The mound itself rising like a great mole hill, has on it neither shrub nor tree, and at its base I should judge it to be a mile, at least in circumference, rich, fertile fields and the open prairie on the east, spread out for miles. The country is by no means one unbroken level, but hills, big and little, rise on all sides in imitation of the mound, and just as far as the eye can reach one can see tiny houses which multiply like mushrooms in this new country. We found attractions near at hand, too, for the wild sensitive plants and numberless strange flower—especially of the pea family cover the hill sides. Altogether I was disappointed in Kansas spring flowers and found not one-fifth of the varieties we have in Ohio, but the Summer flowers quite make up for the lack of earlier ones. On our way home from Burnett's Peak, we stopped on the banks of the Shunganunga, and made careful examination of the contents of a certain large satchel.

It was a picturesque little nook—and the mosquitoes thought so too. Topeka spreads over so much ground, fully half of our ride seemed in the city. New houses are going up every day and appear in most surprising locations. I am acquainted with but a small part of Shawnee County, but that I love right well, and have a good word for Kansas at all seasons. We are much in need of rain now, but who ever saw a Summer without any drawbacks, even in old Ohio. I wonder if any of the Cousins had a jollier Fourth than we and our boys had this year. Just imagine the fun and noise produced by a hundred boys. Rhyme entirely accidental—such genius!

Truly yours, BERTHA KNOWLTON.

Topeka, Kans.

LETTERS FROM THE COUSINS.

UNCLE MARK:—I see by Brother Willie's letter in the last RURAL, that you expect an article on celery culture from me. For first early we use "Nellis' Self-Bleaching," now advertised by most seed houses as "New Golden Self-Bleaching." We make the beds seven feet wide, and make the ground very rich with barnyard manure and hen manure. The barnyard manure alone being too slow for the quick growth we expect in the Fall. We set the plants about seven inches by one foot apart in rows across the bed. The stalks of this variety grow upright and stalky. When the plants get large enough to market, we board one-third of the beds two feet high and hold them in place with stakes driven down in the ground. We then dig the remaining beds, leaving dirt on the roots as much as possible, and pack it between the plants in the frame, upright. We then cover the frame with a supply of seven-foot boards we keep for the purpose, and cold frame shutters. In eight or 10 days they will do to use, taking out that which was packed in, leaving that which is growing to remain until the last. Care must be taken in warm weather that it does not sweat too much and rot. If it does, why take off the cover and give air until dried off. For next early we use Henderson's White Plume. We plant it about one foot apart each way, and at the same time we plant Hartwell and Goldenheart for use in Winter and Spring.

Dover, N. J. HARRY BYRAM.

MAKE plans early this year for getting a good supply of nuts. They will go well next Winter.

Miscellaneous Advertising.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

PERSONALS.

HENRY WARD BEECHER is to lecture next Winter on Ireland.

GENERAL BOULANGER, the French Minister of War, has been presented by comrades with the insignia of the Legion of Honor in diamonds.

DR. FRANK ERASTUS HAMILTON, M.D., LL. D., widely known through the country as one of the chief physicians attending dying President Garfield, died here Wednesday, aged 73.

ONE of Henry Ward Beecher's sisters, Mrs. Isabella Beecher Hooker, is a vigorous advocate of temperance on the platform. She delivered a lecture recently at Saratoga on "The Duty of Women to their Country."

EX-PRESIDENT ARTHUR is now declared by his friends to be really regaining health. He has put on flesh and weighs nigh 175 pounds, takes a good deal of exercise and "looks like a man who has many years of life before him."

THE death of Franz Liszt, the great pianist, the other day at Weimar, was quite sudden, after his return from a triumphal visit to London and Paris, where he had received the greatest consideration from the highest in both countries.

FUNDS are being raised in Texas for a monument to the memory of General Thomas J. Rusk, who was Secretary of War, Commander-in-Chief and Chief Justice, successively, of the Texan Republic, and afterward United States Senator.

ALL the royal princes of Germany have learned trades. The Crown Prince, for example, is an expert jeweller, Prince William has studied the art of glove-making, and Prince Henry, besides being a brave sailor, is an excellent watch-maker.

AUGUST LANGLOIS, a farmer of Pointe Aux Trembles, while feeding his fowls a day or two ago, was attacked by a Game cock. In lifting his hand to push the bird away it was pierced by the bird's spurs. Langlois died after suffering terribly from lockjaw.

JOHN T. ELKINS, of Kansas City, a brother of Stephen B. Elkins, died suddenly of heart disease near Salida, Colorado, on Tuesday, while on a fishing excursion. He owned large silver and cattle interests in Colorado and had served a term in the Senate of that State.

MME. CHRISTINE NILSSON was quietly married in Paris the other day to Count de Miranda, a Spanish nobleman, and has gone to Spain with her husband. She is making a scrap-book of one room of her house, whose walls she is papering with old play bills in which her name appears.

MR. J. F. STUDEBAKER, of the great wagon firm of Studebaker Bros., South Bend, Ind., who is now in Europe with his wife, daughter and niece, last week purchased 180 fine Percheron horses for his extensive ranch in Colorado. The ladies will make an extensive tour in Europe and afterward go to the Holy Land.

CONGRESSMAN LEWIS BEACH, representing Orange, Rockland and Sullivan Counties, N. Y., died at Cornwall-on-the-Hudson, Wednesday, aged 51—typhoid fever complicated with Bright's disease. Though always a Democrat, he was a strong supporter of the Oleomargarine Bill, and earnestly advocated that bogus butter should be colored pink.

THE pretty Countess of Aberdeen, who is one of the most amiable and popular of British gentlewomen, was pelted and covered with flowers by the people of Dublin at the demonstration in honor of the retiring Lord-Lieutenant of Ireland. The Earl of Aberdeen is one of the idols of the Irish, but his wife is quite as popular as he. Her kindness, charity and simple manners won the Irish heart.

A MEMORIAL statue to the late blind Postmaster-General of England, Henry Fawcett, erected exclusively by contributions from women, has just been unveiled in London. He not only opened post-office and telegraph appointments to women and made himself a leader in the cause for their higher education, but he was their spokesman in a thousand instances where his voice was of authority, and where theirs could not be heard.

SENATOR Jones, of Florida, though absent in Detroit during the whole of the late session of Congress, drew his pay regularly on the fourth of every month through a Detroit bank, and still continues to do so, though he says he will never again appear in the Senate or in the State that sent him there, intending to open a law office in Detroit. The law says that "the Senate shall deduct from the monthly payments of each member the amount of his salary for each day that he has been absent from the Senate, unless such member assigns as the reason for such absence the sickness of himself or of some member of his family." Jones refuses to resign; shouldn't the fellow's pay be cut off?

Is the best general purpose wire fence in use. It is a strong net-work without barbs. Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. The Sedgwick Gates made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working all-iron automatic or self-opening gate, and the neatest cheap iron fences now made. The best Wire Stretchers, Cutting Pliers and Post Augers. For prices and particulars ask Hardware Dealers, or address, mentioning paper,

Dairy Husbandry.

THE HOLSTEIN-JERSEY "CLOVER."

THE cut of Clover (owned by Col. Chas. D. Miller, Geneva, N. Y.), in this week's RURAL, (Fig. 338), though quite attractive, fails in doing justice to the subject, particularly in the head and hind-quarters. Clover's head is strong and vigorous, with the perfection of fine finish, not perceptible in the cut. The but appears in the cut round and full, which formation is technically known as "pumpkin but." This is not true of Clover, as she is straight and well formed in the hind-quarters. The picture was drawn from an inferior photograph, in which the cow was very poorly placed.

PEDIGREE.

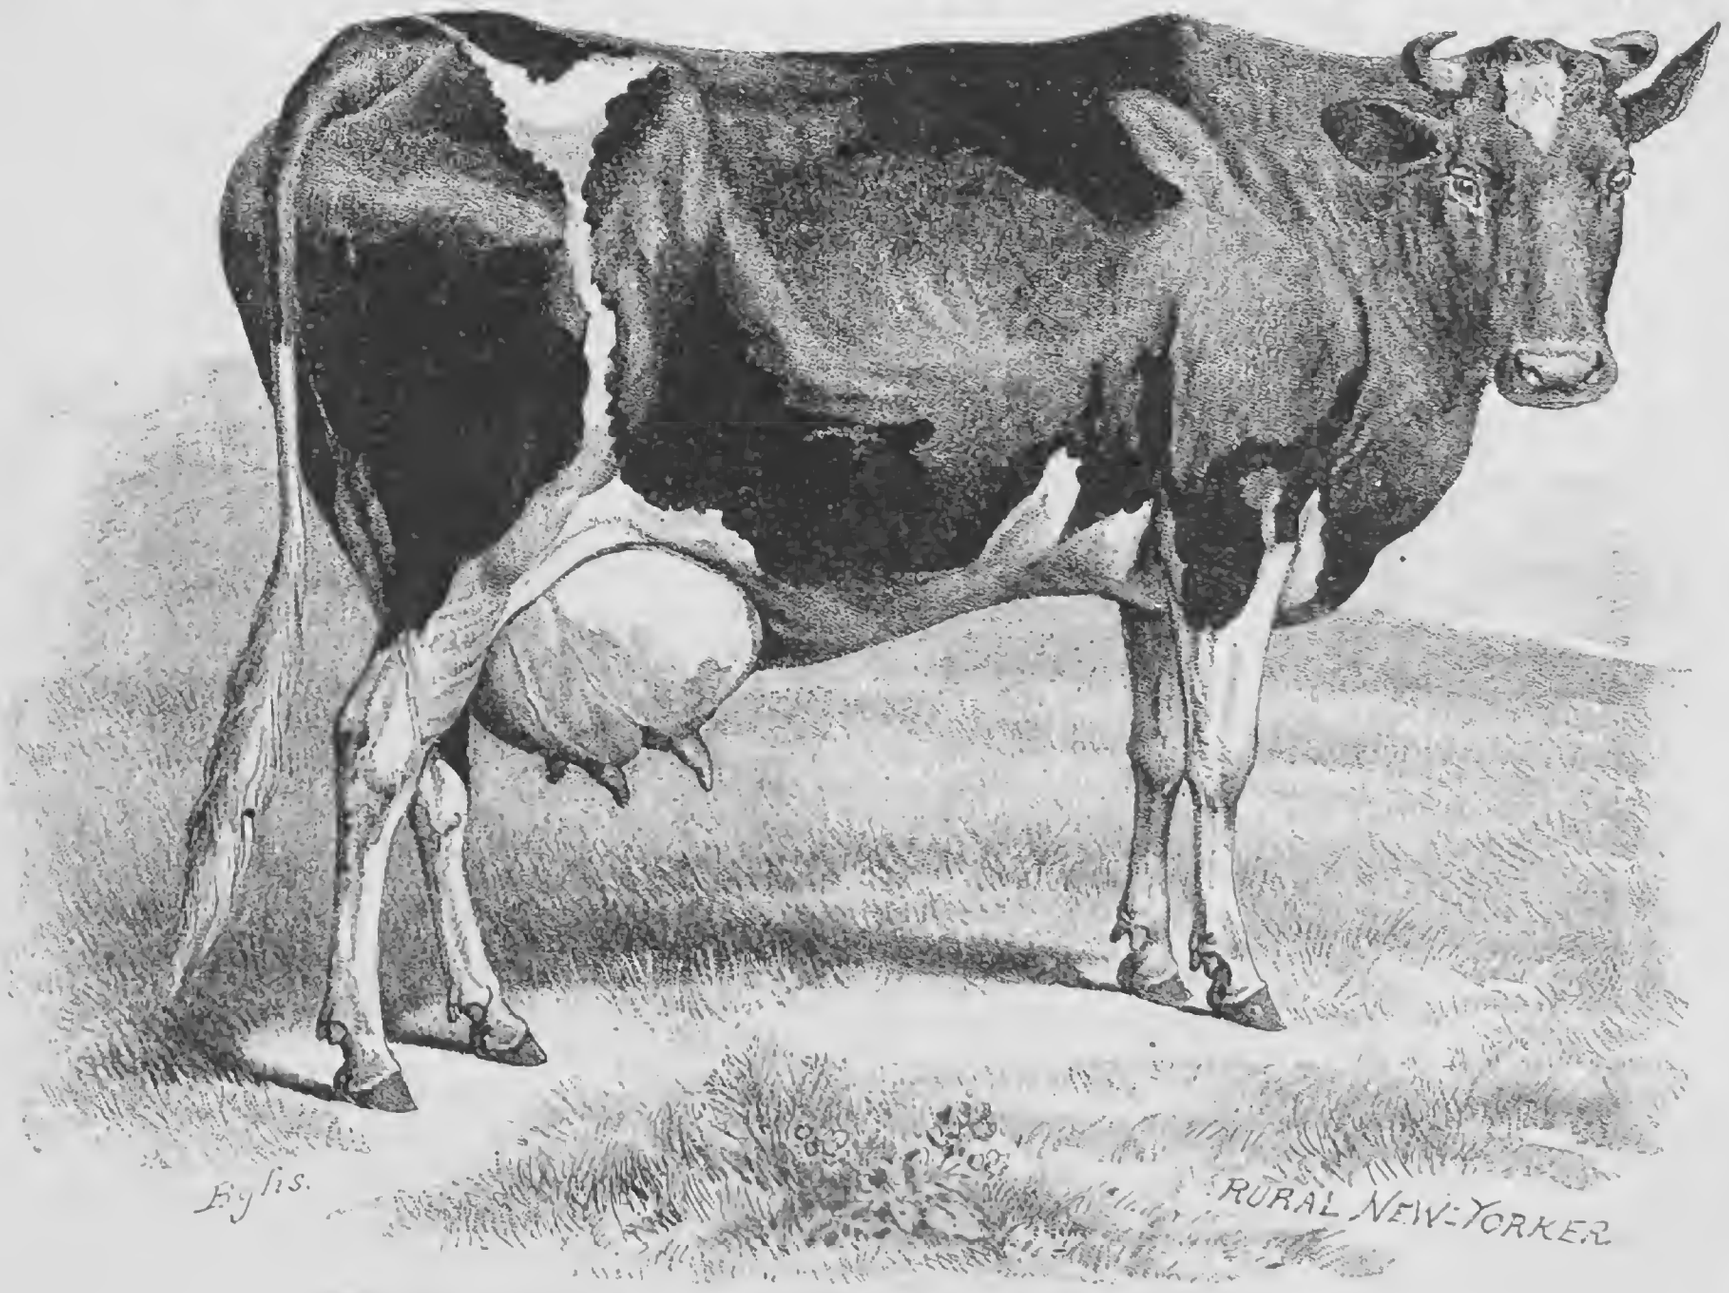
Clover,	Holstein,	Rip Van Winkle,	Friesland Bell
	Stentor,	Dowager,	Fraulein.
	Jersey Buttercup.		

Clover's dam, Buttercup, a full-blood Jersey, was sent to Peterboro, Madison Co., N. Y., as a calf, where she was raised. She has dropped seven fine calves, all sired by full-blood Holstein bulls. Buttercup gave from 30 to 32 pounds of milk per day at her best. Dandelion, her second calf, owned by Malcolm Forbes, Esq., Milton, Mass., gave 42 pounds in a day as a two-year-old, and 50 pounds at maturity. Strange to say, the quantity was not only greater than that produced by her full-blood Jersey dam, but her milk was of a richer yellow color. Clover was the next calf, and has grown into a wonderfully attractive and useful animal. Her greatest day's milk record is 59 pounds, and her milk is very rich. The sire of Clover (Stentor) is half brother to Echo, so she comes naturally by good milking qualities.

The third heifer and fourth calf Buttercup had was Tansy, sired by Conqueror, the great escutcheon bull. Tansy's escutcheon is enormous.

The fifth calf was the heifer Butterwood, also sired by Conqueror, and now owned by Chas. P. Bowditch, Esq., Boston, Mass.

Daisy, the next heifer, was very promising, and milked 30 pounds in a day as a two-year-old. This heifer is owned by Mr. Clifford Watson, Milton, Mass. Thistle, sire Hullemau, was the next heifer, which is very fine and promising, owned by Dean Sage, Esq., Albany, N. Y. Her first calf could not drink all her milk. She and all the others are excellent milkers and make most useful family cows. Their color is invariably black or black-and-white. If one desires cross-bred Holsteins we know no better cross than the Jersey, unless it be Guernsey, for a family cow.



HOLSTEIN-JERSEY COW "CLOVER." From a photograph. Fig. 338.

HOLSTEIN-FRIESIAN COUNTERBLAST.

WILL those apostles of the Holstein-Friesian breed who keep talking and writing about the unchurnable butter-fat or "richness" there is in their milk, which, because of the minuteness of the butter globule, as they allege, will not rise when the milk is set for creaming, but, which they allege, is utilized when the milk is devoted to cheese-making, explain how it comes to pass that the Massachusetts official chemical analysis of Holstein milk yields only 3.29 per cent. of fat, while the Mass. Jersey milk yields 4.34 per cent. The story about there being elements in milk that vanish in the hands of a chemist and a butter-maker, and "materialize" in the hands of a cheese-maker, is good "flap-doodle" to feed fools with. Square honesty is the best policy. If neither a common churn, nor a chemist, nor an oil test churn can make butter fat "show up" in "common scrub" proportions in Holstein milk or cream, how metallic is the "cheek" that assumes that in some charmed way it puts in an appearance in a cheese!—as though rennet had more than mortal power to evoke something out of air, to abstract something from nothing!

Cheese is a solidification of the elements in the milk of which it is made, commingled with a per cent. of water. Rennet is no creator of solids. All it can do is to seize, for the time being, a per cent. of water with the solids, and it takes the fat in the cheese to hold the water for any great length of time—long enough for the rennet to "cheese" the caseine, and keep it moist while the process goes on. The reason a skim cheese dries to chips so soon after it is made, is, that there is so little fat to resist the process of evaporation. The reason it does not digest easily, is, that it is short of fat to act as a lubricant. Two kinds of milk different in butter-fat, make a cheese different in butter-fat, as inevitably as alloy incorporated with pure gold, compromises its purity.

Let the Holstein fraternity address itself to the sensible and honest work of developing some of their magnificent cow-frames into producers of milk as rich, proportionally, in butter-fat, as the common cow gives, and we will have respect for them, and bid them God-speed. A few have done this already, unless the world is fuller of able-bodied falsifiers than I wish to believe. But when they attempt to crowd the fallacy down our throats, that low-grade milk will make high-grade cheese, and try to persuade the dairymen to believe so, they insult the common-sense of every cheese-maker who ever made the milk of the same cows into cheese in both the Spring and Fall, and saw the difference in the yield and quality of the cheese. "Grapes do not grow from thorns, or figs from thistles." "BADGER."

PASTURING COWS.

J. S. WOODWARD.

GIVING EXTRA FOOD WHILE AT GRASS.

IT has been conceded that inasmuch as grass is a complete food, containing the albuminoids and carbohydrates, as well as the mineral elements of animal growth in the proper proportions, therefore stock, and especially cows, when at pasture, need nothing besides what they can pick, to produce the largest amount of milk, butter, or cheese. From the experience of several years I am convinced this is not true, even when pasturing on the most luxuriant growth of the richest fields, let alone when running on the old and half worn-out soils now the rule on most farms.

Conceding that mixed grasses as found in the best pastures do contain everything in the best proportion for making perfect milk, yet in proportion to its bulk, the amount is so small that the cow cannot eat and digest enough to furnish her with enough of these elements to enable her to produce a maximum yield of milk, butter or cheese. This is clearly shown by the numerous tests of cows both for milk and butter yield, which have been made in the past year or two. In every case the best results have been reached only when the cows have had rich foods of some kind to supplement the pastures or soiling when green forage is given. I have also proved it to my own satisfaction by feeding my cows a daily ration of a mixture of bran, oil meal (new-process) and corn meal. This is fed at night, at milking time, and is given dry, although I have no doubt it would produce better results if made into a mash and allowed to soak for a few hours before it is eaten. It largely increased the product of butter on the flushest feed and now that the pastures are suffering from drought it would double the product. This is with me no new experiment as I have practiced it often and always with the same satisfactory results.

WILL IT PAY?

This is the question first asked, and one very pertinent, for butter is at present very low and few wish to increase the production unless it can be done at a price yielding a small profit, or at least without loss. When running at pasture the maintenance ration must first come from the food, and the butter made is surplus product; so that when extra food is given, if the cows are able to digest and assimilate it, the whole available nutritive value should be returned in the churn, if making butter, and I think that two pounds of bran, one pound of new-process oil meal and two pounds of corn meal, mixed and fed daily to a fairly good cow, will give, on an average, an increase of at least four pounds of butter per week. In fact, it has done much better than this with me this year. Now this ration cost at the prices paid here for the various foods, 1.2 cents for the bran, 1.2 cent for the oil meal and 1.9 cent for the corn meal daily, making an aggregate cost of 30 cents per week. Now suppose I sold the butter in our local market at only 12 cents per pound (the lowest price) I should get 48 cents, or a profit of 18 cents on each cow. But we must not forget that my land must be fed, and that the above food is all returned to the soil except what little enters into the

butter. The extra manurial value of the feed is $9.00 per ton for the bran, $19 per ton for the oil of meal and $6 per ton for the corn meal. The aggregate value of the week's ration returned to the soil as plant-food is more than 17 cents, so that I must get 13 cents for my increased butter product to be even. Now supposing I am mistaken one half in my estimate of the increase attributed to the extra ration and that the difference is really only two pounds, and that this is sold at the lowest price, or 12 cents per pound, there would still be a profit of seven cents, and this is worth saving. Some may say I have put the price of feed too low, and others that the price of butter is too high. I have given prices prevalent here, giving the highest price for feed by the ton and the lowest price for butter, and as a rule the prices of butter and feed will be found in nearly the same proportion, so that it is fair to claim that extra food, if judiciously given, will pay even when the cows are in flush pasture.

The Herdsman.

ABERDEEN-ANGUS COWS.

While Aberdeenshire and Angus or Forfarshire, Scotland, have long been contending for the honor of having been the first to produce superior polled cattle and of having done the most to develop the great merits of the breed now known by their joint names, it is known that in Ballindalloch, in Banffshire, on the north of Aberdeen, in the Valley of the Spey and at the foot of Ben Rinne, there has been a race of superior polled cattle for nobody knows how long. For generation after generation the Grants of Ballindalloch and Inveresbie have taken no small pride in the high standard to which their herd has always been kept as long as any record of it remains. The late Mr. McCombie, of Tillyfour, in his book on Cattle and Cattle Breeding, says that perhaps the Ballindalloch polled cattle are the oldest in the north, and in the time of his earliest recollections (and his recollections went back to the first decades of the century), they were superior to all other stock. At present the Ballindalloch herd of Aberdeen-Angus is, the London Live Stock Journal says, acknowledged to be the first in the kingdom, if not in the world. It is composed of over 10 tribes or families, each descended from a famous ancestress, and distinguished for some special characteristic. The first of all in merit is the Erica family, which traces back its pedigree to Erica 843, bought in 1861 for $265 by Sir George Macpherson Grant, the present owner of Ballindalloch. She soon founded the Erica family, which at once took the leading place in the herd and has kept it ever since.

The entire herd numbers 140, including calves, and of these there are no fewer than 49 Ericas, forming a magnificent family, with scarcely a common-place animal among them. They have been frequent prize-winners at all the great cattle shows both in England and Scotland. Though not the largest animals of the polled race, or indeed the largest family in the herd, the Ericas have great excellence peculiarly their own, which they infuse conspicuously in their descendants. Even crosses from them partake largely of their special features, turning out deep, thick, short-legged, heavy-weighing beasts of the best quality. They are constitutionally hardy, and easily kept and fattened. They ripen early, and on moderate keep remain in fine condition; and in the London market fetch the highest prices. Two fine specimens of the family are shown at Fig. 349, page 565. Eugenia 4,170, in the background is considered one of the best of the herd; while Electra 4,196, a very pretty cow in front, was second at the Centenary Show of the Highland Society at Edinburgh two years ago. The likenesses have been re-engraved from the London Live Stock Journal, which is deserving well of British stockmen on account of the excellent series of animal portraits with which it has of late been embellishing its pages.

LIVE STOCK NOTES FOR SEPTEMBER.

HORSES AND COLTS.

THE average horse stable at this season is a cruelty. It is filled with the overpowering pungent odor of ammonia, and infested with those cruel flies which bite like a lancet and from their provoking the constant kicking of the tormented beasts, are known as Stomoxys calcitrans. How can the tired animals rest under these inflictions? This question should be considered by every humane farmer. The remedy is a simple one. Keep the stables clean, litter the stalls with fine dry earth, clean sawdust or dry swamp muck, and spread plaster over the floor liberally once a day. This does much to keep down the flies, but wire gauze over the open windows, a tight door, or one protected in this way, and some Persian insect powder will do the rest.

Did you ever give your horse a bath on the hot days? If not, and there is a river or pond near, let him swim out a little now and then, and then run and roll in the clear grass to dry himself. If he cannot have this privilege, give him a sponge bath in the creek or with a pail of water and wash off the foulness gathered from the sweat and dust. Do to him as you would be done by if you were the horse and the horse the owner. It is a great incentive to do right, to think how it would be were we to change places with other men and even with our animals.

It is difficult to realize the enormous quantity of matter which transpires from the skin of a horse during a day's work in the field on a hot day. A man who works hard often discharges one pound of perspiration per hour from his skin. As this fluid contains about five per cent. of salts, soda and potash and organic acids, some quite offensive, and this solid matter dries upon the skin as the water evaporates, a little figuring and some imagination will give a pretty fair idea of what will be the result to the horse of a hot day's work in the field before a plow.

It is a disputed question, what causes the active salivation or slobbering of horses pastured on meadows and clover fields about this time of the year. It is worth while to consider how this can be avoided, because the loss of saliva is exceedingly weakening and is almost as injurious as the loss of so much blood. Saliva is a very complex fluid, intended as a digestive agent to prepare the food for the action of the stomach. Hence the loss of a few quarts of it every day for a month or more is a serious tax upon the vital forces. This effect is due to several causes all of which may be avoided. The most frequent are acrid weeds, as lobelia, St. John's-wort, pennyroyal, dog fennel, etc., in the pasture. Second growth clover, both red and white, also causes it. It is something to be prevented with care by keeping the horses off from such fields. A small quantity of bran or corn meal with a handful of salt stops the flow of saliva at once. The great advantage of having a crop of something green to cut for horses, as well as other animals at this season, is that any trouble of this kind can be avoided and yet the horses may be supplied with palatable and nutritious food. Millet is perhaps the very best of all the green crops. It is not as laxative as clover, while it is even more nutritious and does not produce a softness of condition which favors excessive perspiration, and is sufficiently nitrogenous to supply all the needs of a working animal.

New oats are commonly considered unwholesome food for horses. This is perhaps due to the irritating effect upon the bowels of the sharp points or beards which are found at the extremities of the grains and which dry up and disappear as the grain grows older and drier. If this result is feared, crushing the oats and adding an equal quantity of coarse wheat or rye bran will avoid any ill effect from feeding the new oats. This mixture is the best food for young colts which should now be weaned and which should have at least a quart—to begin with—daily of some nutritious and easily digestible food.

COWS.

ARE the cows well supplied with green fodder at this season when the pasture fails? If not, how can they be expected to keep up the supply of milk? The growth of green fodder crops is one of the most indispensable "new-fangled notions" which a farmer should take up with. "New-fangled" is by no means a term of reproach. The railroads, telegraphs, telephones, and even the mowing machines were all new-fangled things at one time; but the world could not get along without them now. There are old fogies who pretend that any new device or idea in agriculture is "too foolish for anything," and that what the old gray beards do not know is good for nothing. "Old things are passing away and everything is becoming new" in agriculture as in other matters, and pasturing one cow abundantly on five acres of poor grass mingled with weeds in the month of September, is an old thing that should pass away as quickly as possible. A crop of fodder corn and the early mangels just now will reverse the order of things and make one acre carry five cows for the month, which is doing just 25 times better than the old way.

Those farmers who have a fresh cow or two coming in in September, should by all means compare the product and its value with that from as many cows coming in in March or June. The price of dairy produce in the Winter is about double that of the summer prices, and cows not yet in-calf may well be kept over for three months more to bring them in this time next year.

There are a great many things in the management of live-stock which depend upon calculation and forethought. How to make the most of our farm animals at the least labor, is the grand point to aim at. It is enough to suggest the idea and set thoughts in motion in every owner's mind. One thing may, however, be referred to particularly, which is that the time of the year has come when it is easy to let stock fall off in condition and so go into the Winter, three months hence, under the most unfavorable circumstances. An old proverb says it is time to think of getting over a ditch when you come to it. This is not wise, but otherwise. Ditches are most easily got over when a man thinks betime to carry a plank with him for the purpose, and just now it will be quite wise to be preparing for Winter and get the young stock as well as the old into the best possible condition, and also get their lodging places prepared for them.

SHEEP AND LAMBS.

This is the season for coupling the ewes. Sheep are looking up. In fact they never looked down; it was the foolish owners who got up a panic, and became more scared than ever their sheep were. Now is a good time to select the best possible ram for the flock, and so grade the flock up to a high standard. Every sheep owner has his pet breed, and it is probably the most satisfactory to him. But one thing is needful, and that is, to consider what kind of wool is wanted, for, after all, the fleece brings in the most profit from the flock, and then select a ram advisably. The long-wool sheep are not in favor just now, anyhow.

If a sheep is found limping about or feeding on its knees, the feet want attending to. Paring off the old half-rotten hoof and picking out the gravel under the crust will often remedy the trouble. If the horn is decayed and the feet sore, a little powdered blue-stone and then a dash of tar will be useful. Foot-root needs no description; it is too serious to be mistaken. If it appears in a flock, refer to a good work on sheep, and apply the remedies advised.

A division of the flock should be made this month. Wethers intended for market should be kept by themselves, and the lambs, which require good feeding, may be turned with them. The ewes and their mate are then given the best treatment and feed, the results of which will be apparent when the lambs come in due season.

A supply of roots is essential to success with sheep. With a few roots every day from this time forward, a flock will produce more than the value of them in the quantity and quality of the fleece.

Dipping as a remedy against ticks and other parasites should be done this month, if at all. Soft soap mixed with crude petroleum, in equal parts, is a good dressing for this purpose. So is crude petroleum alone applied as described in the RURAL of August 7, page 515.

To refer to damage from dogs is always in order when thinking of sheep. A ewe badly bitten on the rump by a dog became fly-blown and the maggots were down to the bottom of the deep wounds and in the wool, about them. Some kerosene oil was injected into the wounds and into the wool with a squirt can. Most of the maggots squirmed out and fell to the ground; the rest were picked out with a needle and the sheep was turned loose. In a week the deep wounds were all closed and soon healed nicely. The wool all came off, but it is growing on again all right.

SWINE.

Fat is made most rapidly in mild weather. Swine put up to fatten as soon as the corn is cut, will make weight faster than if given much more food two months later. It pays to have especially for this purpose a piece of corn planted twice as thickly as usual. The stalks with the soft, sweet milky ears will be eaten with the best relish and the pigs will fill out apace and make very sweet pork and firm fat. There will be no cholera in a herd thus fed, unless it is brought in by contagion. This feeding may and should begin in September. The immature ears and half-grown nubbins may be used healthfully while they are fresh, but when, later, they become sour or moldy, they are apt to be unwholesome. It cannot be too strongly urged upon feeders of swine that cleanliness in food and water is indispensable to health, and that pens and yards should be put into the best condition at once for early occupation. Some persons believe that a hog is naturally a filthy animal, and cannot be kept cleanly, and that filth being "second nature" to the beast, cannot be hurtful. It is not a great thing to try differently for once, and note the result.

The Poultry Yard.

A GOOD POULTRY HOUSE.

EVERY farmer should keep at least 100 hens, for I am confident that no stock will pay as well in view of the capital invested. I have a plan of a poultry house which has some points much better than any I have seen. Make the building 16x25 feet, with 8-foot posts and a peaked roof at least one-third pitch, with large windows in the south side. Make the sash to be opened up and down, with wire net-work, to keep out the rats, cats, etc. The windows should fill a large part of the south side. Divide it into two apartments with drawers for nests. The nest boxes should be 12 inches wide, 12 deep and 24 long, so they can be slid through and used on either side of the frame or partition. This is to be made like a chest-of-drawers or bureau, less the back. One room is to be for the laying and the other for the sitting hens, so that when a hen wants to sit she can be set where she has been laying, and the drawer or nest can then be shoved through to the other side. Now make, over the nest boxes, a platform to catch the droppings, sufficiently wide to allow roosts enough for the hens—and a hen ought to have at least one foot for roost room. It should be 6½ or 7 feet high, so that one can walk upright under it. Put the roosts all on a level two feet above the platform, and have ladders on which the hens can walk up. It is a great mistake to put the roosts at different hights, as the hens crowd on the highest roost. They should be made so as to be taken out and washed to keep them clear of vermin. A good shape for roosting poles is octagon about 1½ inch in size. The platform should be cleaned often and put out of the hen house.

This plan may seem expensive for a hen-house, especially to those who are in the habit of allowing the hens to select their nests in the barn, manger, under the barns, in the weeds and the tall grass which are permitted to disfigure their premises; and to find roosting places on the shade, apple and pear trees; but it will pay. W. M.

MORE CARE IN BREEDING POULTRY.

WYANDOTTES are losing their popularity. They do not lack merit—they are splendid fowls. Too many people have had bad luck with the eggs, which they bought from so-called "breeders." Out of three settings I obtained but six chicks, and only two of these were fit to breed from. One setting from a thoroughly scientific breeder would have given more and better fowls. Wyandottes are doomed if the present system continues. There are thousands of amateur breeders who advertise to sell eggs from fowls of noted strains without knowing whether they are fertile—or if fertile, whether they are from properly mated fowls. Such eggs, sold at low figures, are almost sure to give dissatisfaction, and the breed suffers. Many Wyandotte eggs produced a bad mixture of chicks. If this is continued, the breed will suffer more than the breeders. A real breeder works with some definite object in view. To accomplish anything like good results, requires unlimited time, patience and skill. It has taken years, for example, to produce a strain of Light Brahmas like the "Autocrat." People who complain about the high prices asked for first-class poultry are not ready to consider how much patience and skill it takes to fix characteristics. It is no more than fair that the breeder who has spent years in developing a breed or a strain should be rewarded. A dozen eggs for $5 or $25 for a breeding pen may seem like high prices, yet a novice may be making more money selling eggs at $2 per clutch, or fowls at so-called reasonable prices, than a scientific breeder makes at the "fancy" price. The fact of the matter is that if we expect to get something that is good, we must pay for it. When we buy a really good breeding bird or animal, we pay the seller for the time, patience and skill he has spent in previous years; and we pay a small price for them too.

Rural Topics.

GREEN MANURING.

HENRY STEWART.

Difficulty of restoring fertility to poor soil; objections to statements in regard to rye as a green manure, in a late article; the experience of one not applicable to all; rye good where clover won't grow; no crop returns to the soil more than it has taken from it; clover too valuable for hay to be turned under; mature clover roots and stubble contain more nitrogen than the immature crop at cutting time; how to use rye as a green manure; effects of plowing under.

EXPERIENCE WITH RYE.

THE most difficult part of farm-work is to restore poor soil to a condition of moderate fertility so that it can, so to speak, be put upon its feet and help itself, ever so little

When an unfortunate farmer reduces his soil to this condition, or comes into possession of exhausted land, he must begin at the very bottom and work up by slow degrees. It is wise to let such persons know this fact and not mislead them into believing in any short-cut to the improvement of the land by any impracticable method. I am writing not for those who have a pocketful of money to buy fertilizers or manure with, because money is a road to anything and everything; but for those who must wring from an unwilling and unable soil such results as they can, by slow, gradual methods. And I write to neutralize as far as possible the errors made and expressed by A. C. G. (page 479) in reference to this subject.

First, he writes disparagingly of superficial reasoning in agricultural papers to the effect that no other plant than rye will furnish so large a bulk to be turned under in so short a time, so surely and with so little expense,

Second, he then relates an experience of his own which proved to him that the above allegation is wrong and he defies the "allegators."

Third, he then gives the result of his (?) investigations of the failure of rye to benefit his land, and his conclusion thereupon that rye only pays back what it gathers from the soil and adds nothing to the fertility of the land; while clover does very much more, and he thus leaves it to be inferred that clover is much more useful crop for green manure than rye.

Fourth, he very wisely says there is no short-cut to prosperity on a poor soil (I suppose he means fertility and not prosperity) and very unwisely says he who believes in rye, as a renovator will be disappointed in not seeing waving wheat and corn following waving rye. Who ever expected or thought of it?

Now, A. C. G. starts out by casting a slur upon a class of estimable men, who state a fact when they write that no other crop than rye will furnish so much green matter to be turned under in so short a time, at such a convenient season and so cheaply. I know this to be a fact for I have grown several crops of rye for plowing under during my experience with one of the poorest of the New Jersey sandy farms for nearly ten years, and if any person doubts the fact let him tell the RURAL circle what other crop can be sown on poor land to be plowed in early in the Spring, that will give more bulk of matter to the soil or that can be grown for so little cost. I don't know of any.

One man's experience goes for no more than it is worth; no rule can be laid down as a guide from it; because the conditions are probably different from those of others and at any rate every circumstance—the most trifling apparently—will have a bearing upon it. One who neglects this truth in making statements is speaking or writing superficially; hence A. C. G. is superficial and his experience must be weighed and judged carefully. Moreover, he proves this by his statement that he based "great expectations" upon the plowing in of a crop of rye when, had he read with care "*every* agricultural paper," he would have probably seen that no great expectations should be based on rye for the purpose mentioned, because it is, as it were, the first brick of the structure which is to be reared upon it.

A. C. G. argues very illogically upon the subject of his investigations. He calls them his, but the figures seem very much like those of Dr. Weiske, and if he quoted him, he should have acknowledged it. Then we should have seen that he had wandered from his subject and was pasturing in clover grown for other purposes. What he says of the manurial value of rye and clover is true, but it has nothing whatever to do with the question at issue. No farmer who can grow a clover crop of which 26,580 pounds of dry matter exist in the roots, would borrow much trouble as to the choice between rye and clover as a green manuring crop.

But leaving this point, I wish to show the fallacy of the reasoning of A. C. G. in the course of his very superficial investigations. He became satisfied that "something more than bulk of plant growth is needed to be turned under; that there must be *some affinity* in the plant with the *forces* that nourish crops to make it a useful fertilizer. This affinity clover possesses, while rye does not." What is meant by affinity? Is it any secret, mysterious force or attraction, or merely the contribution of so much plant food to the soil, together with a certain chemical and solvent action upon the soil exerted by the decaying vegetable matter? If this is meant, then are not the potash, lime and nitrogen of the rye quite as useful to the soil as those of clover, as far as they go; and is not the carbonic acid developed by the decomposition of the matter of the rye equally effective as a solvent agent upon the mineral particles of the soil, so far as the quantity goes, as that of the clover? If not, why not; and in what respect does clover act with greater and mysterious force than rye beyond the quantitative difference? It is also another misleading fallacy to say that rye only pays back to mother earth just what it receives, in such a way as to lead readers to suppose that clover does more. It does not and cannot return to the soil any more than it takes from it; it does, no doubt, get its valuable substance from a lower depth than rye or any other plant, and is therefore a much more valuable manurial crop for plowing under or for feeding.

But what is the farmer to do whose soil will not produce clover? I have tried repeatedly to grow clover on poor soil and failed; the land was too poor. I believe clover can be turned to better use than to plow it under. Dr. Lawes says the soil is actually richer in nitrogen after a crop of clover hay and the second crop cut for seed have been taken off, than it was after the first crop—that is, that matured clover roots and stubble contain more fertilizing matter than the half-grown crop; and, moreover, the manure made from feeding a ton of clover hay is worth in money and fertilizing value more than the hay is. Then it is folly for a farmer who can grow a crop of clover, which is as valuable as is stated by A. C. G. to plow it under, because his soil is past that stage and only needs reasonably good ordinary management to produce good crops of all kinds and to increase steadily in value. I have now nearly thirty acres of clover, and I am cutting it all to the last stub for feeding and am not plowing it in, and hope to keep my land improving by this practice. But when I could not grow clover, and the young growth died out in its infancy from utter poverty and starvation, I could grow rye, and by plowing it under in June, and then sowing buckwheat and then plowing that in, and sowing a second crop and plowing that in, and then spreading thirty or forty bushels of lime per acre, I have raised forty bushels of corn the next year on soil where previously not one ear could have been grown. It was this sort of culture, with the addition of manure made by feeding clover, hay, bran, corn and cotton-seed meal to cows, which brought up the lightest kind of blowing sand to a dark brown loam, which would produce eighty bushels of corn and two tons of clover hay and more of Orchard Grass to the acre. It was slow work; but nothing else could be done, for there was no alternative, and the rye was the beginning of it.

Finally, what is effected by plowing in a crop of rye? Several things: First, we get something where nothing else can be procured and at a season when we can get nothing else, and at a most trifling cost; second, we get a certain quantity of fertilizing matter. Taking A. C. G.'s figures we get 62 pounds of nitrogen, 69 pounds of lime, 30 pounds of potash, (and 24 pounds of phosphoric acid which he forgets) and all these cannot possibly be of any less value in the soil than as much procured from any other crop. Third, we get a large quantity of organic matter which in its decomposition produces carbonic acid and other acids which act upon the soil, dissolving the mineral elements and liberating more lime, phosphoric acid and potash, so that the crops can avail themselves of these for food and so flourish to a corresponding extent. This result well known to occur in the soil has been ignored by A. C. G. There is no doubt that for its purpose, and as far as it goes, rye may be made very useful in this way. A starving man would thank you for a crust, poor and dry, which a hearty man would throw to a dog, and he would find in it nourishment that would give strength and enable him to make efforts to hunt or work for better food. In like manner a starving soil will thank you for a crop of rye plowed under, and will be nourished by it; while a soil that will grow a crop of clover may reject it and gain no benefit from it (but I doubt it, for everything of the kind is useful to any soil as far as it goes) and indeed does not need it; but the poor starved field will be nourished by it and will be helped to do better by it. A. C. G. should remember that circumstances alter cases, and if he has never come across land so poor that it will not grow clover and will find much benefit from a crop of rye, the only crop that can be used under some circumstances and which really gives the most for the least given, I can assure him that there is such land and lots of it and the owners are anxious to know what to do with it.

RICH FARMS ABANDONED.

ALLEN NORTON LEET, PH. D.

AFTER running through most of the Western portion of Connecticut, and observing the agrarian condition of the locality, I am simply amazed at the situation, especially at the state of affairs in Fairfield County, indeed, through the whole Housatonic and Naugatuck region. Here is found as fine land as the sun ever shone upon; the soil is rich and ripe for tillage, the land cleared, with sufficient timber, however, for all purpose of utility, undulating with an unequaled landscape, water—that great desideratum sought for so frequently on Western prairies—abounding everywhere. The most favorable conditions for farmers and cattle abandoned, for the most part uncultivated, and with farm-houses, fences, barns dilapidated and falling into ruin. Yet there is a market at hand, and with hay bringing $20 a ton almost on the spot, there were never finer opportunities for profitable farming than in this region. It seems that New England is passing through the same condition as that which the Archbishop of Canterbury recently spoke of as prevalent in his own country. Said he: "In England there are hundreds and hundreds of farms for which no tenant can be found—farms which landlords would willingly hand over to any solvent tenant for a nominal rent, and in many instances for no rent at all, merely to get rid of the obligation of paying local rates."

Riding along the main road from Norwalk to Danbury, past incomparably fine farms, I noticed farm-house after farm-house vacated, while the owners were willing to rent them with contiguous land varying in area from 15 to 100 acres, at prices ranging from $100 to $500 per year. A farm of 75 acres, consisting entirely of arable ground and rich soil with only 15 acres cultivated, comprising besides a large house of 14 rooms and two barns, one of which cost over $5,000, the cellar being blown out of solid rock, is vainly offered for sale at $7,000—hardly the value of the buildings. And so the story is repeated all through Western Connecticut. The superior inducements offered to young men in factories in the way of increased wages are not alone to blame for this condition of affairs. The ordinary Connecticut farmer is wedded to old modes and the conservatism of scythes and hand-sickles, in spite of the fact that the principal inventions in agricultural implements are the products of Yankee intellects. Abandoned by the young men, the old farmers become supine and are dying off, while the stream sweeps onward to find lands over-occupied and superabundant crops in the West, where corn is so cheap that it is burned for fuel, and wheat-growers are impoverished by the glut or diminished demand for the American products.

Shakespeare has shown how the fool among his neighbors became the wise man of history. One such farmer near Danbury, applying the energy, thought, perspicacity and force to the work of farming that as a merchant he had exercised in business, two years ago bought up a fine farm of about 100 acres, with a farm-house, for $3,000. He determined to make his new acquisition profitable. He went to the Labor Bureau at Castle Garden, and told Superintendent Jackson that he wanted half a dozen German immigrants from the agricultural portion of the Fatherland, agreeing to pay them $10 a month wages for six months—from April to October. Two of the number he wanted, however, for a year. Among the multitude who desired such places there was no difficulty in obtaining the needed help, and they were sent forward. One of their number understood a little English and acted as interpreter for the rest. The farmer found them tractable, hard workers, skillful and profitable. With their aid he made $4,000 clear profit—mostly from straw, hay, buckwheat, corn, potatoes and tobacco—the first year. When the year had rolled around the men went off for higher wages in another line of labor, and he replaced them with other help from Castle Garden, so that last year the farm yielded a profit of more than $5,000. He expects still larger returns this year.

What was done by him could be done by others, and thus the problem of obtaining help could be solved. It is one of the mysteries of mysteries why men should be as gregarious as the thoughtless sheep that quietly follow their leader; and it is rarely that one of the flock is found independent and thoughtful enough to look back and see that the "land of promise" is behind him, and the prospect ahead is delusive and full of difficulties. Perhaps, after wandering in the wilderness for forty years, like the Children of Israel, the native and the foreigner alike may discover the land of Canaan to be at the very threshold of their starting place—in the land of the Pilgrims and the Puritans, ready at the touch of the agriculturist to flow with milk and honey, and to thrive as the "garden of the Lord."

Farm Topics.

CORRESPONDENTS' VIEWS.

SOME seven years ago, merchants doing business here bought 25 acres of waste land. They paid $25 per acre. The land was in very bad condition, grown to bushes and wild apple and cherry trees. The hay was cut this Summer from 5¾ acres of this land, and the crop amounted to 24,620 pounds. Seven years ago this same piece yielded only 4,000 pounds. This result has been brought about by putting in practice the same principles that have made the business of the owners a success. Every tree and bush was cut and the plows started through the soil. The stones and stumps were cleared off, and the land was heavily manured and sowed to grass. This cost nearly $100 per acre, but it has paid, for almost every year since then, in two cuttings, about four tons of first-class hay have been taken from every acre. With hay at present prices, one can figure on the profit of such crops. None of the hay is fed in this lot, but every year a moderate dressing of manure is applied. The manure is carted to the lot from the stables in town. These 5¾ acres are more profitable than a $5,000 Government bond would be, and quite as safe. They did not cost, improvements and all, more than $150 per acre. There are plenty of folks around here who could learn valuable lessons from these facts. Thousands of acres of hill lands in this county are just as good as this lot was seven years ago, and they can be bought for from $10 to $40 per acre. They can be made as profitable as this now is by the same care and labor. There is no reason why raising good hay in New England should not be as profitable as raising cotton at the South or wheat at the West.

Terryville, Conn. C. W. C

IN looking over farms about me, and reading the articles from those who claim to make money at farming, I am led to believe that the people who really make money at farming are very few. Most of the moneyed farmers that I know of got a start in some other line of work. They have been agents for some machine, or have been in regular business. Many of them have regular trades at which they can work at times, and thus secure a little cash. Such men come before the public and tell us what to do to make money on the farm. To follow their advice we should have their capital, their business training or their trade. How can we secure these things?

Gratiot Co., Mich. H. B. G.

I GAVE my experience last Spring, favoring greatly the Shaffer Raspberry. With a larger crop to dispose of, I have changed my mind. The color, as the RURAL said, does spoil it for a general market berry, until the people are educated up to it. I was obliged to sell it at the same price as the black raspberry, and this will not pay as it is not firm. The moldy color does not please the eye. The Cuthbert sells at sight. The Marlboro with me makes poor growth, and is almost tasteless. C. M.

Fairmont, N. Y.

A NEW SWEET.

I presume not all the readers of the RURAL NEW-YORKER have heard or read of the new saccharine, invented or discovered by Dr. Constantine Fahlberg. A great deal—a very great deal—is claimed for the new sweet which is said to be neither a nutriment nor a poison; it is simply a flavor, and stands in the relation to cane sugar as 220 to 1, the new saccharine representing the larger figure. Its chemical name is benzoyl sulphuricimide. It "does not decay, mold or ferment, neither is it attacked by bacteria, and has no injurious effect upon the human system," says a reporter in the American Analyst, who caught and interviewed the celebrated doctor. It is manufactured in Germany, and is selling at from $10 to $12 per pound. It is a product of coal tar, is not a sugar, as we are informed, and "contains carbon, hydrogen, sulphur, oxygen and nitrogen."

What an effect this product will have upon the canning of fruits, if, as it is claimed, it will both flavor and preserve! Even the curing of meats comes within its scope, while bitter medicines are rendered sweet without changing the action of the drugs. In these days of progress we hardly know whether to be conservative or radical—to believe all we hear, or to take every new thing with the customary grain of salt. P. O. C.

A FEW CONCLUSIONS IN ANIMAL NUTRITION.

PROF. J. W. SANBORN.

I. THAT some important law in animal nutrition is as yet either wholly or mostly unknown.

A. Throughout many years of careful work I have found that neither the total of organic matter, nor the ratio of albuminoids to carbohydrates has given the uniformity of results to be expected, for there were very radical differences.

B. Chemistry can give only rough approximations to real nutritive values.

C. The character of the food given and the

combination in which it is given varies the amount of water drank, but varies more radically the direction in which it leaves the body.

C. 1. Coarse foods give in the urine a low percentage of the water drank.

C. 2. Concentrated foods increase the percentage of the water drank, that is found in the urine.

C. 3. Coarse foods increase the amount of water that is vaporized from the skin and lungs.

C. 4. As the water vaporized requires many times the food per pound vaporized that is required to warm it up to blood heat, this loss is very great.

C. 5. These are conclusions reached as the result of experimentations which I have not had the means to continue.

II. The belief that a pound of organic matter in green food is worth more than it is in dry food is without proof, and contrary to much exact data.

A. The belief that cooked food is more valuable than uncooked food, is opposed by the solid facts of trial.

B. The belief that a pound of organic matter as silage, is worth more than the same original amount would have been if properly preserved, is contrary to II and II *A*, and is without demonstration, as yet.

C. Many silage rations with grain have been shown to be more effective than hay, but so too have I found that eight pounds of organic matter in certain forms of dry food combinations, are as effective as 12 pounds of organic matter in the form of hay.

D. No proof of the superiority of silage in certain combinations over certain dry foods, hay especially, has been yet given that is superior to other proofs of the superiority of similar certain combinations of dry foods over certain other combinations of dry foods, hay especially.

D. 1. The law that controls in this domain no one has as yet fully found out. The relation of exit of water from the system may afford some explanation of the matter, and may not. It certainly has an influence, but its relations are as yet unknown.

Ag. Coll., Columbia, Mo.

Farm Economy.

THAT QUESTION.

On the first page of the RURAL of July 31st a question is submitted to its readers concerning the yield of two plots of land belonging to a neighbor. On one plot a given amount of manure was spread in February and on the other plot the same amount of manure was put out in February in a heap and allowed to remain until April, when it was spread. The yield was decidedly in favor of the lot on which the manure was spread in February, and we were asked why this difference?

I do not know that I can give a satisfactory answer, but I would suggest that manure exposed to rains and snows leaches very rapidly and loses to a great extent its fertilizing property, and but little if any value is left except the insoluble portion. The manure spread in February leached as much as, and perhaps more than that in the heap, but it did so in the right place, and fertilized the entire lot, while that in the heap was confined to the space it occupied. Again, there is decided virtue in shading the soil during the Winter. I do not know how this comes about, yet I believe it to be a fact. Several years ago I planted a five-acre lot to corn. In the Fall the corn was cut and put up in shocks. It was fed from the lot during the Fall and Winter, many of the shocks remaining in the field the entire Winter. The following Spring the lot was seeded to oats. The lot made a fair yield, but on the spots of ground covered by the shocks of corn during the Winter the yield was extra. On these points the oats were twice as tall as anywhere else in the field. No fertilizer was used, neither was there any leaching of the shock, the drainage being perfect and the corn and fodder sound and sweet until all was consumed. I believe any covering for the soil, whether straw, grass, weeds, brush, leaves or anything else, is a decided advantage during Winter. There is more virtue wrapped up in the mulch than in anything else of the same size and strength. A. B. C.

Kentucky.

A GOOD GATE.

I SEND a sketch of a labor-saving device (shown at Fig. 339, 340, 341) for use with slide gates. It is simply a new way of hanging the old slide gate. The posts are set diagonally to each other the same as in the old way, only they are set closer together so as to leave just enough room for the gate to swing. This requires but little more than the thickness of the boards each way. Just below the top board the two posts are joined by a piece of bar-iron about one-and-a-half inch wide and a quarter of an inch thick, bent and fastened as shown at *f* Figs. 339 and 341. The upper board of the gate has a piece of iron plate fastened on near the end, with a notch or slit cut in it, of suitable size, so that when the gate is in place, it

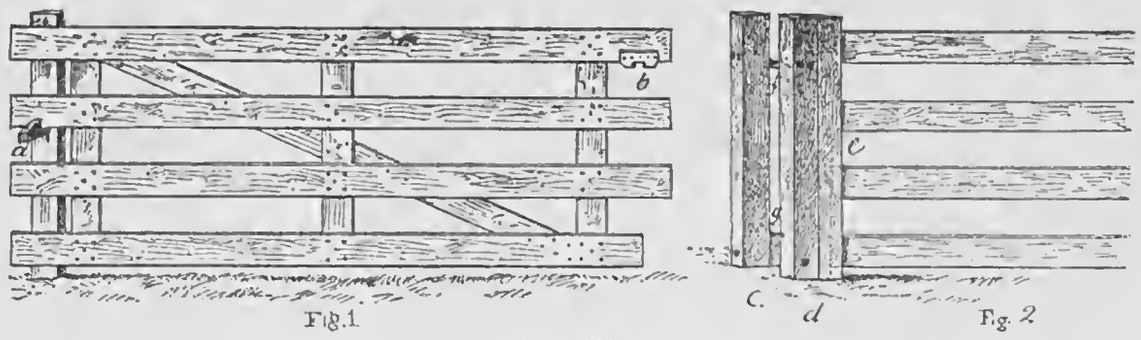

Fig. 339.

catches on to the bar or strap between the posts, shown at *b* Figs. 339 and 341. At the bottom of the gate-posts a block is fastened between them so that the bottom board of the gate, which is cut to the right length, abuts against it. This is shown at *g* Figs. 339 and 341.

That is all there is of it. The gate swings as easily as any gate you ever saw, or is lifted out of place and removed entirely if desired without trouble. It does not slide like the old slide gate, but swings like any gate hung on hinges. When closed it is held by an old-fashioned catch (at Figs. 339 and 341), which holds it clear from the ground. When it is desired to open the gate it is lifted out of the catch, when it may be easily swung around.

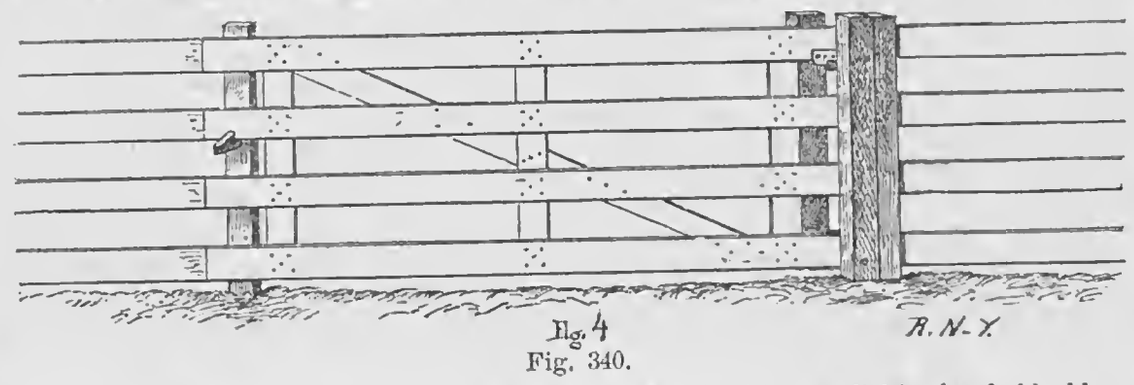

Fig. 340.

This gate hanging was invented by a Mr. Healey, of Kalamazoo, Michigan, and has been in use on his farm for several years. It is not patented. F. HODGMAN.

FRAME FOR SLAUGHTERING HOGS.

Mr. A. Freed, of Lancaster, Ohio, has built an arrangement like that shown at Fig. 342, which is very convenient at slaughtering time. It will pay farmers to put up something of the kind before the time comes for killing hogs. The best place for the frame is on a low hillside where there is a slope of, say, two or three feet in 12. Any good posts about eight feet long will answer. These properly notched and sunk into the ground make about all the

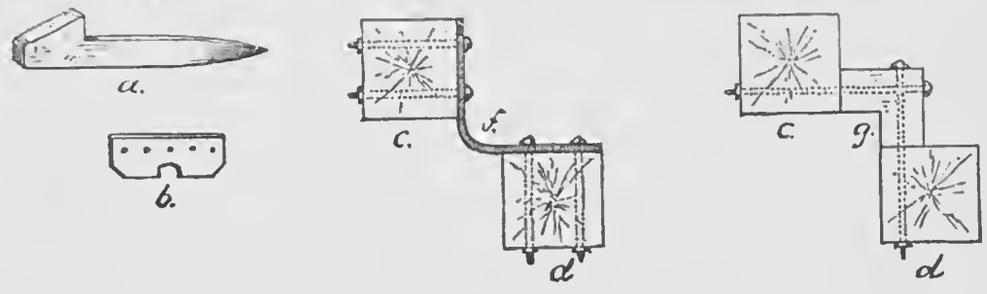

Fig. 341.

labor required. Studding (2x6) from eight to 12 feet long are spiked to the top of the posts, as in the illustration. They should be about two feet apart. Spike the end pieces on and the frame is done. The cross-pieces that the scaffold boards are placed on, are three feet or less from the top. The scalding tub is placed and fastened as shown in the picture.

Horticultural.

RURAL LIFE NOTES.

THE MINNEWASKA BLACKBERRY.

OUGHT we to condemn or speak disparagingly of any new fruit in advance of its introduction before thorough trial and without giving some definite reason? I am led to ask this question after reading the following in a RURAL editorial on blackberries, page 500: "The new Minnewaska, which will be offered for sale this Fall, does not, so far as we can judge, promise to fill any occupied space." It is not clear from this remark that the RURAL has made a personal trial of the variety, though it may have done so. The great point which has been claimed for the Minnewaska, as I understand it, is hardiness combined with the usual vigor of growth, great productiveness, size and quality of fruit. As to the latter qualifications, no one who has seen it thus far will be likely to raise any question. As to hardiness, I can only say I never saw a dead branch on any new cane in this latitude during the three years I have known it without protection—never saw it growing farther north. I have a plant of it in my garden now loaded with splendid fruit with great thick canes growing so high that next season I expect to pick the fruit from a 10-foot ladder. If asked why I don't pinch it back I may say it was done weeks ago, and now I shall "let it go," and if injured during the Winter fruit men shall hear of it. Now, among the present needs of fruit growers north of the 41st parallel is a hardy blackberry of good size, quality and productiveness. Nothing so far introduced fills the bill except in isolated cases in a few favored localities. Since 1884 I have been inclined to believe the Minnewaska was the variety needed. Let us give it a fair trial and then report.

[By all means. We have eaten the fruit of the Minnewaska a number of times. It is not as good as that of the Kittatinny. The berries are no larger. Is not the Kittatinny or the Dorchester or the Snyder, Taylor, Wilson, Jr., Lawton, Early Cluster, etc., sufficiently prolific? The Minnewaska may be hardier than any of the above. That is what we want to know. We have tried in vain to procure plants that we might test them and report upon them at the Rural Grounds. Its value will depend upon its hardiness.—EDS.]

THE CRYSTAL WHITE BLACKBERRY.

Regarding the Crystal White Blackberry, which attracts many by its novelty, it is just as well to have people understand that it is a delusion in this latitude. I tried for years to grow it, but never got a single berry either ripe or green. The canes were killed to the ground each Winter. Now the RURAL says the fruit is delicious but the cane neither hardy nor prolific. That settles it. Don't let us bother with a shy-bearing, tropical fruit at the North. In fact I don't believe it would sell in market if we could raise it. Look at the white and yellow raspberries, delicious and beautiful as some of them really are, their color is against them in market, and yet they are very prolific.

Fig. 342.

ABOUT MARKETING FRUIT.—OVERPRODUCTION OR UNDER CONSUMPTION.

The subject of marketing our fruits to the best advantage is, if I mistake not, one of the most important—if not, indeed, the most momentous—which confronts the fruit-growers of our country to-day. For years and years we have been hotly discussing the merits and defects of varieties, raising new sorts and improving the old, trying new methods of culture, increasing the yields, fighting insect enemies and warding off insidious diseases. Now we get the fruit in abundance, and what shall we do with it? How shall we market the crops at a profit, or even without becoming in debt to either the picker, carrier or seller? These questions may seem frivolous, and even sensational, to many. But when the grower of small fruits here along the Hudson, in the shadow of the great metropolis of the Union, with its million-and-a-half consumers, is forced to let his fruit rot in the field for want of a market, the question becomes of serious import. Beginning with the strawberry crop this year, if the number of bushels that were sold at a loss, together with the quantity which it did not pay to pick, were known, few would believe the statement. I recall an instance where 100 crates were sold at $1 for the lot—one cent a bushel—while the poor grower stood by protesting that it cost him $64 to have the fruit picked. It was on Saturday, and an exceptional case, doubtless; but nearly every strawberry grower in this valley can probably produce instances of like nature from his returns of 1886. Then, as to raspberries, which have usually been so remunerative in past years, bushels and bushels have been allowed to remain ungathered because the grower could not afford (!) to market them. A large part of the cherry crop has shared a like fate; and tons and tons of currants have been left to rot upon the bushes for a similar reason, many of which are still hanging there, sound and good. A Highland grower says he came out $4 in debt to the seller on a consignment of one ton of fine fruit. And now what shall be done with the large grape crop which is maturing? I have no desire to discourage growers of small fruits, nor am I prepared to admit that there is in reality an over-production if the annual supply could be properly distributed. But the question to be solved lies right here. Thousands of people everywhere are yet scantily supplied, if at all, with fresh fruits in their season, and yet tons of fruit rot in the fields or on the way to market without a buyer. The American Horticultural Society is soon to meet; other associations of fruit men and growers will gather in every State and county. Is there a more important question to growers and consumers, which should be fully discussed, than the proper adjustment of this difficulty? H. H.

Field Crops.

SQUANTUM SUGAR CORN.

I SHOULD like to speak a good word for the Squatum Sugar Corn. Among the many novelties that are continually being introduced, so many are worthless that often a good thing is catalogued by seedsmen for several years perhaps before its merits are generally known to the public. How much of a novelty the Squantum Corn is I cannot say, but it is not planted to any great extent in this section that I know of, and I notice that it is not generally catalogued by seedsmen, or if it is, it does not appear under this name. I have planted this corn now for several years, and no other is acceptable on my table while it is in bearing. If it has any faults I have never discovered them. It is what I suppose would be called a second early, coming in after the Early Minnesota. The ears are about the same in size as the latter—perhaps a trifle larger—well filled with eight to twelve straight rows of pearly-white grains. It is exceedingly productive bearing three and often four ears on a stalk, and remarkably sweet; in fact the flavor is wherein it principally excels. What more a person wants I cannot see, and I know of nothing more delicious than a dish of this corn fresh from the garden. Some may prefer the larger ears of the Evergreen, Egyptian and Mammoth, but they are more fond of distending their jaws than I am. As long as corn is sold by the hundred, however, I suppose the larger eared, late varieties will gain the preference in the market, although for my part, if I had to buy my corn, I would rather have the smaller ears of the Squantum even at the same price per hundred. I have sent some of this corn to the grocers on several occasions each season, and it is the same old story every time—the customer sends back word that he wants some more of that kind of corn, and one even went so far as to say that he would have no other. It seems to me that if our farmers would pay more attention to quality some-

times, and less to quantity it would pay them, at least in certain markets. WM. HEWITT.

Mercer Co., N. J.

MANSHURY BARLEY.

THIS year Manshury Barley has very markedly shown its superiority over the other six-rowed kinds. While they ripened prematurely and are light in weight—some very seriously so—Manshury, by its strong growth and deep-rooting stood the burning heat and drought, and has ripened a fine crop. I think ours will go considerably over 50 bushels per acre for the whole crop. Besides this, the malsters have got over their prejudice, and are offering from five to 10 cents per bushel more for it than for common six-rowed. One at Phelps, N. Y., told me the other day that it was by far the best barley he had ever handled.

Lockport, N. Y. J. S. W.

JAPAN CLOVER.

JAPAN CLOVER—Lespedeza striata—is the plant for the South. It is self-propagating, and affords valuable and inexpensive pasturage. In 1865 we found it occupying a small space near the roadside surrounded by broom sedge. It soon displaced the sedge, gave good pasturage, and covered thousands of acres. It ran out noxious weeds and grasses, and rendered worthless land profitable. It appears to grow anywhere, stands drought, and even grows luxuriantly at an elevation of 4,000 feet above the sea. It requires no cultivation, and will not run out. Grazing does not appear to injure or retard its spreading. It is a perennial, and as a stock-fattener and improver of soil, we have never found its equal. J. W. W.

Macon Co., N. C.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

RUTGERS SCIENTIFIC SCHOOL.—This school enjoys the income from the U. S. grant for colleges. There are 56 students in attendance; how many of these are studying agriculture we are not told. The course in agriculture is designed to afford young men "the scientific knowledge necessary to success in practical farming." Free tuition is afforded for 40 students from New Jersey each year. The college farm consists of 97 4-10 acres. Last year 90½ acres were under cultivation, producing good crops. The stock consists of six horses, 47 cows, eight hogs and 117 head of poultry. The stock products were 119,487 quarts of milk, $98.60 worth of pork and $82.32 worth of eggs and poultry. Many interesting experiments with soils, grasses, etc., are carefully conducted. Parties desiring information regarding the workings of the institution, should send for the catalogue to Prof. G. H. Cook, New Brunswick, N. J.

COLORADO AGRICULTURAL COLLEGE.—Seventh Annual Register.—This institution is located at Fort Collins, Colo. There were at the close of the last session 87 students, representing seven counties of Colorado and six other States and Territories. The college appears to be doing excellent work, and its influence is increasing. C. L. Ingersoll, President, W. F. Watrous, Secretary.

FAIR PLAY.—Messrs Lord & Thomas issue an attractive circular giving a list of the agricultural papers that issue special fair editions. According to the circular nearly 4,000,000 papers will be given out at the various fairs of the country. The circular wrongly states that the RURAL'S Special Premium List will be distributed in part at fairs. The papers will not be so used. They will be sent direct to the best farmers in America.

NEW YORK EDUCATION.—Thirty-second annual report of the Superintendent of Instruction of New York State.—This well-printed volume of 600 pages is sent us by Superintendent A. S. Draper. It should be read by every teacher in New York State. In the various reports from schools and colleges some excellent hints may be secured. Teaching is a profession, and teachers should aim to master every detail of it. The trouble with too many teachers is that they never try to rise out of the common routine. They teach children by machinery that has been in use for generations. We need brightness, originality and tact in the school-room. We would gladly have every teacher in the State study this volume carefully. The educational system of New York State is a wonderful affair. The office of Superintendent is really one of the most important offices in the State in its bearings upon the welfare of the people. We had, in 1885, 11,254 school districts, 11,912 school houses, and a total school population of 1,721,126. The number of pupils attending school for some portion of the year was 1,024,845. The aggregate value of school houses and sites in 1885 was $33,347,581. The total expenditures for the maintenance of New York schools for 1885 was $13,896,650.59. There were employed 31,399 teachers (6,021 males and 25,378 females) who received as salaries, $8,762,950.23. These figures show the magnitude of our school system and the vital importance of carefully handling this vast yearly expenditure. No public expenditure can be so easily reached and controlled by the people and none can be made to accomplish so much when properly handled or to accomplish so little when neglected. Few public documents are of more importance than these reports. In one of the reports we find these words: "If men are in need of a doctor, they want not only an educated man, but one who understands the practice of medicine. Why not use the same common sense in selecting a teacher?" Why not indeed! That strikes to the very root of the matter. Instead of selecting a teacher because he is a friend of the family, because ho is a good singer or a "nice fellow," pick out a good *teacher*. Every teacher and every school official in New York State should secure this report and study it.

NEW YORK DAIRYING.—Second Annual Report of the New York State Dairy Commissioner.—Many papers in this State have been loudly asking what Commissioner Brown has done in return for the appropriation granted him last year. They should read the report and find out. We think the Commissioner is doing a good work, and heartily approve his work in behalf of dairymen. There are people in the State who appear to think that so long as a single pound of oleomargarine is sold in this city, or if the Commissioner does not personally inspect every suspected grocery store, he does not earn his salary. For such people this report will be valueless; but for thinking and progressive dairymen it is a valuable document. The figures showing the extent which the sale of bogus butter has injured the dairymen are appalling. In 1882 there were handled in New York city 79,864,840 pounds of butter, valued at $23,025,295.05. The receipts increased in 1885 to 93,506,850 pounds, but the value decreased to $19,502,977. If this one market can show such a loss, what might the total loss of the country amount to! It is estimated that the total loss to the dairy interests of the country, in consequence of this bogus trade, cannot be less than $70,000,000. During 1885, 8,072 samples of suspected butter were purchased. Agents spent 3,885 days in the work of convicting dealers in dishonest butter. It is almost impossible to convict a dealer in New York County. The course of procedure in the courts is too complicated. To bring an offender to trial in this city requires three times the labor that it does in Brooklyn. The success of the operations should not be measured solely by the number of absolute convictions. The activity of the agents in the city, and the acknowledged honesty of their purpose, have kept oleomargarine in an unpopular position and prevented much dishonesty. It is estimated that the enforcement of the law has reduced the amount of oleomargarine handled in New York by about sixty per cent, while the quantity manufactured in the United States has increased over fifty per cent. In the report on milk we are told that during the year ending December 21, 1885, 197,219,560 quarts of milk, 3,758,320 quarts of cream and 3,088,320 quarts of condensed milk were brought by rail into this city. One can readily understand how, without supervision, the milk could be easily adulterated and a vast amount of disease sent in with it. The State agents have spent 1,978 days, traveled 88,165 miles, examined 19,409 samples of milk, and inspected many dairies, creameries, condenseries and stables. We believe the department is doing good work—one worthy the support of the people.

What Others Say.

RATHER MIXED AS TO WHEATS.—We have received bulletin No. 16 from the Ohio Agricultural Experiment Station. It treats of "Tests of Varieites of Wheat." These tests began in the fall of 1882. The present harvest is therefore the sixth successive crop of wheat grown upon the same land. The plots are one-thirty-second of an acre in size. Of the Diehl-Mediterranean Wheat the Director says: "The seed was received from Department of Agriculture. A tall-growing variety, straw rather weak. The heads are not large, but are square, close-set on the rachis, bearded, bronze-colored glumes, kernel red. This variety has been recently introduced, and we have it, or something almost exactly identical, under four different names. It has nothing to commend it over the best well-known varieties." At the Rural Farm (Long Island, N. Y.) we have given this wheat a good trial and, as we have thrice or more said, don't see anything remarkable about it. But the above remarks are rather indefinite. It is *not* particularly a tall-growing variety in most places. The straw is not weak. The heads are not set on the rachis at all. The head includes the rachis. If the Director has four other kinds "almost identical" he should state what they are. The writer of this does not dispute that the so-called Diehl-Mediterranean is an old variety. He has questioned from the beginning the fact of its being a new variety, but has not felt at liberty to state his doubts until now.

The Director speaks of the Landreth (Armstrong) as having strong straw and large, loose heads. It is superior, he says, to the old Silver Chaff which it closely resembles. Then he describes Silver Chaff as a well-known variety not desirable for his section and as "quite similar to Landreth (Armstrong) and Martin's Amber." Silver Chaff is by no means "well-known" as such, out of Ohio at least. Its straw is weak and it differs materially from Armstrong or Landreth in other important respects. It is, for instance, by no means as hardy; it stools less, the kernel is smaller, and it is later; the culms and leaves are of a silvery green color.

The Director says that "Golden Grains Wheat was all killed but a few stalks, and these were about equally divided between the old Black-bearded Centennial and another smooth sort." Are not Golden Grains and B-b. Centennial for his climate spring wheats? Again, the Black-b. Centennial is a densely bearded kind. Hs speaks of it as smooth. The Director says "it is unworthy of cultivation." By no means. It may be in Ohio, but in California, Colorado, etc., it is one of the choicest kinds.

Of the Surprise, he says: "Medium to tall-growing sort, strong, stands perfectly. Heads large, closely set and well-filled, beardless, glumes white, kernel white. Looks very fine. A fine variety to be sure." But then the Director adds—"but it will hardly become a favorite." Why not pray? Why praise a variety to the skies simply to tell us it isn't worth cultivation? He says that Martin's Amber is similar to Landreth." Are not they the same? The Station has grown them for "several years" and ought to know. The report says that both Martin's Amber and Landreth are superior to Silver Chaff, which they closely resemble, implying they are the same. But in describing Silver Chaff, he remarks that it is not desirable. Does he find Silver Chaff the same as the old Treadwell? And is this the reason why he says it is "well known"? Are Martin's Amber and Landreth desirable? We should suppose they were since the report makes the following statement:

> Landreth, 39.9 bushels per acre.
> Martin's Amber, 36.7 bushels per acre.

the latter weighing 63.5 pounds per bushel, the former 60.5 per bushel. We fancy that the variety described as Golden Prolific is an old sort; that the Egyptian is not Egyptian, that no particular variety is understood by Velvet Chaff. It seems to us impossible for any one to make a valuable report on wheats until more pains have been taken to learn the true and synonymous names of the kinds described.

HYBRID OR CROSS-BRED.—The RURAL NEW-YORKER replies to our recent note on this subject that, while there may be differences of judgment as to what may be a good species and what a variety only, nevertheless, when crosses are made between plants which botanists class as different species we should adhere rigidly to the term "hybrid." That is what "hybrid" means. When fertilizing the pistil of one variety with the pollen of another variety of the same species we are "cross-breeding," and we should say so. With more light in the future these varieties may be erected into separate species, or what are now species may be reduced to the rank of varieties. It will then be time enough to designate what are now cross-breeds as true hybrids and vice versa. Upon the whole, we think the RURAL has the best of the argument. There will always be enough careless language, and there is little danger of being too accurate. And yet if any one should willfully or carelessly offend in this particular we would not vote to have him burned at the stake.

The above is from a late number of the Weekly Press. The very best evidence in the world that an agricultural editor is striving to do his best for farm interests is shown when he fully acknowledges himself in the wrong. There are some "farm" papers and some men who can *afford* to confess their errors. There are others who can't afford to confess anything.

SOWING GRASS SEED IN KANSAS.—Our friend Prof. Shelton, of the Kansas Ag. College, says, in his last report, that the time to sow grass seed in Kansas is, without exception, in the Spring, and recent experience shows that this work should not be undertaken too early in the season. Seed sown after the spring rains have fairly set in has never failed with him since 1874 to give a good stand of grass. In a few instances, and where the Winter following has been warm and open, he has had good success with clover and Timothy sowed in the Fall, but the result of sowing Orchard Grass, Alfalfa and Blue Grass in the Fall has certainly been disastrous. The seed germinates rapidly if sown in the Fall, even more quickly than in Spring, but as the native vegetation fails from the action of the frosts, the young grasshoppers collect upon the young grass, doing it serious damage; what remains, suffers seriously and is often destroyed by the action of wind and frosts. On the other hand, when the seeding is sown too late in the Spring the young and tender plants are consumed by the sun as soon as they appear. Seed sown any time during April will rarely fail to germinate and succeed well in making a vigorous growth. However, he does not advise seeding before the warm Spring rains have set in. He has sown both Orchard Grass and Alfalfa during the early part of May with most excellent results. Fall seeding may be said to be better than spring seeding in the case of all plants which make a growth in the Fall sufficient to withstand the rigors of Winter. This, corn and oats and most of our grasses will not do. But at whatever season the seed is sown, nothing should be put in with the grass seed. Rye, wheat or oats, among which grass seed has been sown, are a serious detriment to the growing grass, and the grass plants, without doubt, are injurious to the growing grain. It is often argued that the tall grain will shade and protect the young grass. But grass does not need shade when grown in proper season; it needs the sun, and especially it needs moisture: and this the vigorous grain is continually taking from the soil, thus robbing the young grass from the start. Every farmer knows how spindling, sickly and lacking in strength of root and stem is a grass or clover plant growing in a dense mass of grain. When this grain is harvested in June or July, just when the summer heats are greatest, the delicate, starved grass plants are certain to perish, unless long-continued cool and cloudy weather prevents. He is aware that, in favorable seasons, considerable success is obtained by seeding the grass with another crop. But, even during these favorable seasons, a better and more vigorous stand may be obtained without the rivalry of vigorous grains; and, upon dry seasons, a failure of the grass is almost certain when seeded with a grain crop.

HONEY FOR SWEETENING.—A writer in the Pacific Rural says that during the 16 years in which he has been in the bee business he does not remember having bought a single pound of sugar for his own use. He uses honey as sweetening for tea and coffee, for stewed fruit, and anything else where sweetening is required. If a good article of honey is used, having no strong or pronounced flavor, one can soon become accustomed to it and never miss the sugar. At the present low price for extracted honey it ought to be used in every bee-keeper's house, if only as a matter of economy and to save the expense of sugar.

THE English Commission appointed last year by the Conservative government to inquire into the causes of the depression in trade arrives at the conclusion that, as a matter of fact, low prices and consequent diminished profits constitute the only evidence of depression. The commission does not believe that legislation regarding labor has injured trade. It deprecates any increase in the hours of labor or any diminution of wages, and it looks with favor on labor organizations.

MIXTURE FOR LIMING EGGS.—To four gallons of boiling water add half a peck of new lime, stirring it some little time. When cold, remove any hard lumps by a coarse seive; add ten ounces of salt and three ounces of cream-of-tartar, and mix the whole thoroughly. Let the mixture stand a couple of weeks to temper before using. Pack the eggs as closely as possible, and they should be kept closely covered with the preparation. If treated when newly laid, nine months after they will taste nearly as good as when fresh. Eggs to be preserved by any method should be treated the same day they are taken from the nest; their quality depends upon this being observed. This is Dr. Hoskins's recipe, as we find it in the Vermont Watchman.

FARMYARD MALARIA.—The editor of the New England Homestead recently visited a farm upon which there had been much sickness, one child having died of diphtheria and there being a general complaint of "malaria." He found that the sink spout emptied into a sickening pool directly under the kitchen window, while above was the bed-room that had been occupied by the deceased child, with its window also opening upon this scene of filth and source of disease. Now, if instead of this wastiness and waste of fertilizing material, the farmer had rigged up a barrel on wheels to catch the drip from the sink and the house slops generally, and had emptied it in his garden as often as full, we think there

would have been much less sickness, the child's life might have been saved and all the family made healthier by the liberal use of the garden products thus freely fertilized.

A MISCONCEPTION CORRECTED. — Our friend, Waldo F. Brown, writing of Purdue University to the Farmer's Review, says that among farmers at large there is a feeling that the Professors of Agriculture are a set of soft-handed, kid-gloved men, with broad-cloth coats and silk hats, whose interest in agriculture is expressed by the promptness and regularity with which they draw their salaries. Nothing, he says, could be father from the truth. There is not a man among those whom he met that does not understand thoroughly the details of farm work, and without a single exception they were brought up on the farm, while many of them were for years practical farmers; and although their work is now that of instructors rather than of farmers, they go to the fields with their students and direct their work and often work with them. Personal contact with them by our intelligent farmers would at once banish suspicion and correct the false views which are held by many concerning these men and their work.

CLEANING WOOL.—The United States Consul at Sydney reports that an improved machine has recently been erected in Victoria for cleaning wool on the skin. It is modeled after the English machines used for the purpose, and consists of a series of beaters forming a cylinder. The skin is made to pass between two rollers revolving at a high rate of speed, but which hold in position and feed it against the beaters. The gearing apparatus is so arranged that the rollers can be reversed and allow the skin to be worked in and out. The machine is said to leave the pelt in a softened condition, thus helping to improve the quality of the basil.

CALIFORNIA WHEAT FLEET.—From a lengthy review in the San Francisco Bulletin upon the above subject it appears that 237 vessels cleared from California during the cereal year just ended. Of these, 231 were for Europe, 4 for Australia, and 2 for South Africa. This was the smallest in any year since 1878-79, when only 109 were cleared. The registered tonnage of last year's vessels amounted to 377,473. The freight earnings amounted to $4,123,091, or a little less than $11 per registered ton. There were only 11 vessels that went at over 35s., and 142 went at or under 30s. The classification of the vessels according to nationalities, was as follows: British, 145; American, 77; German, 11; Norwegian, 3; Italian, 1; Total, 237.

SOUTHERN FRUIT-GROWING.—The Charleston News says that increased attention has lately been given in South Carolina to the cultivation of fruit and the vine. Thousands of acres are planted each year with watermelons. During the past four years more than 100,000 peach trees have been planted in Barnwell and Aiken Counties, and it is estimated that at least 70,000 of these trees are now in bearing condition. As early as 1884, 3,000 acres of South Carolina farm land were planted with watermelons. Owing to bad returns on that crop the area in 1885 was only 2,348 acres. The profits on the crop last year were so large that there have been more than 5,000 acres planted with melons this year. It is estimated that under favorable conditions each acre will yield at least 500 melons, and that the total crop grown for shipment this year to outside markets will amount to 2,500,000 melons.

AUSTRALIAN WOOLS.—Though it is generally known that the wool and wheat are the staple products of the Australian colonies few particulars have been published concerning the former. Though efforts looking to the reduction of duties on wool in the United States have been frequently suggested for several years, no definite action has been taken, the wool-growers of the United States fearing the competition that they would thus have to meet. It is believed, however, that there are some grades of Australian wools which are not grown in the United States, but which it is found necessary to import for the purpose of mixing with the home-grown article, and it has been stated that a reduction of the tariff on such grades would be beneficial. The imports of wool into Great Britain are valued at £31,500,000, almost the same value as the cotton imports. The increase in the exports from the colonies has been considerable within the past quarter of a century, as is shown by the Australian Times and Anglo-New-Zealander. While in 1861 the number of sheep was 24,000,000 and the export 73,000,000 pounds of wool, last year there were 75,000,000 sheep and the export reached 435,000,000 pounds. The exact number of sheep, according to official returns, is as follows:

New South Wales	30,37.,871	Tasmania	1,720,027
New Zealand	14,650,000	Western Australia	1,547,061
Victoria	10,630,178	Fiji	5,869
Queensland	8,994,000		
South Australia	6,996,406	Total	74,913,407

The average yield per sheep is five pounds in grease or two-and-a-half pounds washed. The weight of the bales varies in the different colonies from 244 to 270 pounds for scoured, 294 to 374 for washed and 370 to 450 for greasy. The merino fleece is heavier in weight than an equal quality of other varieties, and appears to have improved under the Australian climate. Prices vary, of course, according to market fluctuations, but they are fortunately now ruling higher than has been the case for some time past. Different varieties grow best in the different colonies to which they seem adapted. For instance, while New Zealand produces excellent luster wools, those of Western Australia meet best the requirements of the worsted trade.

ALSIKE CLOVER.—Our friend J. S. Woodward writes the Press that this plant is valuable on certain soils and for certain uses, but much of what is just now being said in its favor is not justified by the facts. Mr. W. first sowed it more than twenty years ago, and as it has been quite extensively grown in portions of Niagara County, N. Y., where he lives, during all the time since, he knows something of its advantages and defects. It is peculiarly adapted to the moist, black, heavy soils of the black ash and soft maple swamps which once covered a considerable portion of the country, and for a long time it was extremely profitable for its seed, which often yielded as much as five, and sometimes seven, bushels per acre, which at first sold for $20 per bushel, and for a long time for as much as or more than $10. These days, however, are past, and it now seldom sells for more than $5, and sometimes for less than $2. It delights in rich, heavy clays, even if they are quite wet, especially in Fall and Spring. It does fairly well on heavy uplands, but is of feeble growth and short duration on light, sandy lands, and does not amount to much on light, dry gravel.

As a pasture plant it is far inferior to Red or White Clover, for it does not endure the trampling of stock so well. After the middle of Summer it makes but little growth and none if the season proves dry. As a meadow plant it makes a great show, beginning to blossom quite early, and continuing in bloom until after Red Clover should be in the mow, and during the whole time its solid bed of pink flowers leads the owner to think it will give him about three tons of hay per acre. But it lodges badly, and when cut and cured it is light and chaffy and seldom yields a single ton to the acre on the richest soil. Its hay is of only medium quality, not nearly so good as Medium Clover, while it yields hardly more than half as much per acre. After cutting for hay it makes no growth, affording no second crop or any after-feed. Its form of growth is creeping, like White Clover, with only small surface roots, and it puts nothing into the soil if plowed after haying, and only a very small quantity if used for green manuring when in full growth. Its true uses, Mr. Woodward thinks, are as a honey plant and for mixing with other "grass seeds." Being such a persistent and abundant bloomer, it has no superior as a honey producer, it being estimated that it will yield 500 pounds per acre in a good year. It grows well along with other clovers, filling in the bottom, and if they are killed in spots by the wet or in others by cold the Alsike fills up wonderfully, as it is entirely hardy and at haying time it will add several hundred pounds to the weight of hay on each acre. The proper method is to apportion the seeds the same as for ordinary seeding, and then add two pounds of Alsike seed per acre. Let this be extra, as you will then have none too much seed for the best results. When sown with Medium Clover and that is cut, as it should be, when only in full bloom, the Alsike will again start up, giving a large second bloom and perfecting so much seed that it will fill the land, and on soils well adapted to growth will become nearly as persistent and permanent as White Clover.

A TRANSFORMATION. — The editor of the New England Farmer tells of a horse that was owned by a shiftless, lazy farmer for many years, and which from colthood up always looked like an old-time horse. It was thin in flesh, rough of coat and poor in spirit. It had a lazy gait that was recognized by all the neighbors as it passed. Neither the continual jerking of the reins, nor the repeated touch of the driver's whip would make any lasting impression on the rate of speed. After getting along into his "teens" the owner concluded he must sell or swap him off for what he would bring and buy him a new and young horse. The animal went for a low price of course, but he fell into the hands of a different sort of a man, one who fed well and took good care of all his animals. In six months the former owner did not know his horse when it was driven by. It was nearly 200 pounds heavier, its coat was smooth and glossy, its head was up, eyes bright, and in general appearance the animal was the picture of vigor and good health. He had dropped his old gait and traveled like a horse that is proud of his blood and breeding. We have always felt that people who are not willing to give good care to their animals have no right to own them.

BRIEFS.

It is told in St. Paul, that the children in Minneapolis, its near-by and hated rival, have refused to read the Bible in the public schools because it is "filled full of talk about St. Paul," while from Genesis to Revelation there is no mention made of Minneapolis.....

DR. HARVEY says, in the Weekly Press, that if tired in one place, tired in all. If you tire a horse's neck by checking him high you tire him all over. When a man has a toothache he has no comfortable cubic inch in him, from scalp to sole.....

"NEW JERSEY is to have a horticultural society that will hold its first exhibition in Orange the coming Fall. Messrs. Barr, De Forest, T. J. Slaughter and James R. Pitcher are at the head of the organization."

So says a late number of our esteemed contemporary the American Florist. Is it possible the Florist does not know that New Jersey has already a horticultural society, and has had for 10 years past. The gentlemen named are not all ignorant of this fact, for some of them have had personal invitations to attend its meetings. If Orange is to be favored with a society of its own, it is all well enough, but to imply that the State has to this time been without one, is to ignore the large amount of work and good done by the earnest labor of the members of the State Society and its indefatigable Secretary.....

The Editor of the American Garden is informed that the arsenic of Hammond's Slug Shot is so mixed with its antidote as to render it harmless to all except insects. A correspondent of that journal states that certain horses were hitched to the back of his wagon and before he knew it had eaten over half of a ten-pound package of Slug Shot. Beyond a slight physicing they were not harmed. Dr. F. M. Hexamer, it seems, recommended the formula to Mr. Hammond and he should be able to state whether it is or is not poisonous. The statement made by the New York Experiment Station after having analyzed a package sent there by the RURAL NEW-YORKER appeared several months ago.....

THE experimental stations of the country, says the New England Farmer, where already established, have not cost the farmers more than from ten cents to a quarter of a dollar per year on each farm in their respective States. We must remember that the stations are young, and there has not been time for the great amount of good to come from them which we hope to receive in the future. Do not let us find fault unreasonably till the preliminary stages of the work are passed.....

MR. ROE says, in Harper's for August, that the quotation, "Doubtless God could have made a better berry than the strawberry, but he didn't," has been quoted by the greater part of the human race, and attributed to nearly every prominent man from Adam to Mr. Beecher.....

Mr. A. M. PURDY has sold his paper, the Fruit Recorder, to the publisher of Popular Gardening. .....

BERRIEN CO., of Michigan, has started a Fruit Exchange, as we learn from Mr. Libby's Garden. Each package sent out by members bears the inspector's stamp—thus:

The Michigan Exchange hereby guarantees the contents of this package to be uniform and true to appearance; and the buyer will confer a favor by reporting any fraud detected in any package bearing this stamp. W. A. Brown, Inspector, Benton Harbor, Mich.....

MR. FAIRCHILD, of Connecticut, says in the Connecticut Ex. Station Report, that if he had farm manure enough to manure one acre well, and he wanted to plant three acres, he would spread the manure over the whole and make up the other two-thirds with commercial fertilizer. .....

MAKE cuttings of pelargoniums for winter and spring blooming. Pansies may be induced to bloom freely during these hot days if the soil is kept moist. Otherwise the plants will burn and the flowers become very small. A little bed at the RURAL Grounds is now as bright and fresh as earlier in the season. The soil is very rich, mellow and *moist*. It is well to sow the seeds of pansies now for next year. So also, seeds of hardy perennials and biennials may now be sown—pinks, hollyhocks, aquilegias, delphiniums, &c., &c.....

Everywhere.

TRANSCONTINENTAL LETTERS.—LXII.

MARY WAGER-FISHER.

The coast valleys of California; Saucelito; San Rafael: Duncan Mills; the dairy region of California; the "white Chinese," prices of dairy land; Tomales Bay; timber waste; rural scenery.

I think there can be but one opinion in regard to the preferableness of the coast valleys of California for country living. Irrigation is not required as a rule, and the midsummer heat never reaches that excessive degree which obtains in the valleys of the interior. Between the Sacramento Valley and the coast are three regions of country lying between ranges of mountains—none of great hight and traversed by as many different railroads, that have considerable repute for their climate and products. The smallest of these is Napa Valley, in Yolo County and the furthest inland from the sea, and the hottest in Summer. An aximander made a jaunt through it, finding it largely planted with grapes, and very attractive. Of the two other regions I can speak from personal observation, having spent two days in each.

It was about March 10th when we left San Francisco by ferry for Saucelito, which lies on the opposite side of the "Golden Gate" from San Francisco. All the ferry trips from San Francisco are of the most charming character, delightful boats, and the bay with its islands and its shipping always an imposing and spirited sight. Among the vessels at anchor lay the "Bear," one of the boats that was engaged in the Greeley relief expedition. The United States Government, I believe, owns the islands in this bay and a number of them are utilized for purposes of defence. Saucelito is a small town perched on the side of the steep hill, or mountain rising up from the water. The views from it are superb, but its climate of winds and fogs is too much like that of San Francisco to render it a favorite place of suburban resort. By rail from this point it is nine miles to San Rafael, the road running in to this town from San Anselmo and out again—simply a spur. San Rafael has a population of 5,000, and this population largely does business in San Francisco. The town is built in a basin of the mountains, the chief peak of which is Mt. Tamalpais with a zigzag carriage road to the summit. A lady who lives here told me that the views to be had on this drive equal anything she saw in the Yosemite Valley. The climate is very equable and mild, there is a sea breeze, but no fogs, and people in not robust health speak of San Rafael as quite a paradise. It is a pretty place; there is no outlook except one mounts the hills, but the hills are vine-clad, and beautiful villas are planted up the mountain sides, in the midst of beautiful trees and flowers. All in all, it is very like a southern French or Italian town. Shop-keepers sat on the sidewalks in shirt sleeves, reading and smoking, and women were on piazzas with their sewing.

From San Rafael we went to the extreme northern terminus of the North Pacific Coast Railroad to Duncan Mills, in the Redwood Forest. Duncan Mills is eighty miles from San Francisco and six miles from the sea-coast. The road follows for fifteen miles Tomales Bay and is never more than fifteen miles from the sea, and for sixty miles of the way runs through Marion County, and the remaining twenty miles lies in Sonoma. This region is considered the best dairy country in the State, the butter being of fine quality. There is comparatively little land suited for tilling, but the great hills and canyons are covered with grass, upon which the cattle graze the entire year around. It keeps green about a month longer in Summer than does the grass in the interior valleys, and there seems to be abundant water furnished by springs in the canyons. At intervals there are Redwood forests, and then miles of country devoid of trees, except along the water-courses, the principal being the Russian River. The entire route is of a very picturesque character, and the road, from necessity, a narrow-gauge. The conductor on the road told me that in the previous week, from one station, he had taken to San Francisco 175 boxes of butter of 50 pounds each, and at various stations were stacks of butter boxes. They are of wood, painted on the outside, about four feet long and from twenty to twenty-four inches wide, with a lid shutting over the top. The butter is made into rolls actually weighing less than two pounds, but called that, and these rolls are stood on end in the box, and about twenty-five fill it. There are many Swiss and some Italians engaged here in dairying, and the Swiss I have heard called the "White Chinese" of the coast. They are industrious, economical, frugal, and confine their association chiefly with the Swiss colony around them.

Butter, at the time of our visit, was unprecedentedly low, selling at twenty cents; and, taking the cost of producing it into consideration, there could not be much room for profit. Somebody said that the climate was too damp and cool for successful cheese making, and it was too far to ship milk to market. A dairy ranche of 600 acres had been sold by the railroad company, near Duncan Mills, for $22.50 per acre.

At Point Reyes, a very desirable locality, dairy ranches were held at from $40 to $50. As every where on this coast, land is high—much too high—although the expense of farming here, where no special provision must be made for Winter, is much less than in the East. A ranch of 2,500 acres on Tomales Bay was stocked with from 300 to 400 cows, many of choice breeds. On account of the mildness of the climate Jerseys do well here. This ranch rented for about $6,000. Churning is done chiefly by horse power.

Tomales Bay is a great place for ducks, and we were told that some farmers thereabouts made $1,000 a year from ducks' eggs. They shut up the ducks at night, and on salt water it costs little to feed them. Camp Taylor on this road is a famous camping ground for parties and the picnic excursions sometimes number thousands of people. It is in the Red woods, on a creek, with fish, quail and deer for the sportsman—if taking innocent life is sport.

We staid all night at Duncan Mills, and upon reaching the town at once took to the forest by way of what is called School Ma'am Canyon, from a schoolhouse having been built in it years ago for the children of the lumbermen. We walked for a mile over logs, corduroy and rude bridges in the bottom of the canyon and up the mountain side. I found a beautiful oxalis growing abundantly in the forest, a large magenta flower and leaves spotted with white on top and purple beneath. In the parlor of the hotel was an openwood fire and a grand piano. A Chinaman served at the table; he said his name was Louis Doe, that he had been five years in the country. But as "the Chinese must go," was the cry of the white laborers and written even on the Redwood stumps, Louis Doe's gentle reign will probably soon come to an end.

The saw-mill at this point is of only moderate capacity, cutting 40,000 feet per day and upward. The trees are more carefully harvested than formerly, although to the eastern mind the waste of timber on all this coast seems absolutely wicked. Wood for burning is cheap enough in the forests, but by the time it reaches San Francisco it costs rather more than coal, and the latter is largely transported in colliers from Seattle, and sells here at $9 per ton. Red-wood lumber costs about the same as White Pine in the East, possibly a little less. It resists decay admirably, but is a soft wood. In selecting real estate in California various things need to be considered. Both the land and the climate vary greatly within a short radius. Both are good or bad in spots. There is no malaria in this region, but it is damp and the trees are covered with moss and lichens. The peach trees were coming into bloom, and the roadsides were resplendent with the blossoms of golden poppies, pink mallows, hemp and the exquisite nemophila, while there were miles of buttercups and wild mustard. The hills were adorned at intervals with oaks, madrona and the manzanita. Eucalyptus trees were in abundance—millions have been planted in the State, but it is said that they exhaust the soil like black walnut, and are growing into disrepute except for roadside purposes. The white farm houses had a thrifty, tasteful and well cared for appearance. The conductor said that California farmers lack in patience—that when a field becomes overrun with weeds they turn it over to pasture—it tires them to death to plow around a tree or stump, and they have not yet learned that it requires brains and skill to farm well. A beautiful shrub in full bloom was the California Lilac, Ceanothus thyrsiflorus.

RURAL SPECIAL REPORTS.

Georgia.

PERRY, Houston Co., August 12.—This is a great place for water-melons; but they haven't paid this year as the market is overstocked. Nineteen persons shipped some, but it has not yet been demonstrated that as many dollars clear profit have yet been realized from the business. One party shipped three car-loads, and not a cent has yet come to him in return. Another paid $25 for half a car-load to ship with a similar amount of his own mellons. In return the commission merchant asked for a remittance of $17 to help pay freight. It is the opinion here that Cincinnati commission merchants played a "grab" game against the shippers. L. M.

Illinois.

CHAMPAIGN, Champaign Co., Aug. 14.—This county has suffered much less from drought than many other parts of the State; but we were needing rain too, and as I write, we are having a delightful down-pour—the third within three days. We have had good crops—hay, oats, and especially wheat, of which there was but a small acreage. The prospect for corn is now good. In many parts of the State the dry weather has done great damage. G. E. M.

Missouri.

SEDALIA, Pettis Co., August 12.—Owing to a five weeks' drought the crops in this county will be very light. Corn one-third crop; oats, fair crop; wheat small yield but good grain; very little rye sown, no barley, potatoes one-half crop; hay good; broom-corn two-thirds crop, grapes rotting badly. People very much discouraged, but we are having some rain now which will help out a little. Prices low. W. K. R.

New York.

LOCKPORT, Niagara Co., August 12.—We have the most severe drought for many years. There has been only one good rain since May 10th, and none since June 15th. The result is that corn is being injured; early potatoes are being ruined. Much seeding is burned out *dead*, and pastures are very dry and poor, and cows that have not been fed extra have nearly dried up and are thin in flesh. Harvest is now over, and crops were never put in in better order. Not a drop of rain on most of them from the time they were cut till put into the barn. Wheat is yielding very well for the amount of straw. Many fields are going over 30 bushels per acre. Oats are a fair crop of extra fine quality, and the straw where well housed will be worth half as much as hay. J. S. W.

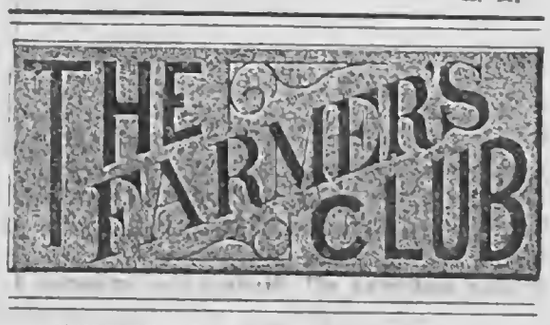
CLINTON, Oneida Co., August 10.—Potatoes, a moderate crop; some cry of rot, but not extensive. Hops obliterated; not a bale in Oneida County. Hay was a light cut, but second crop will be fine to compensate. Corn stalks are short, but the stand is good for yield. E. P. P.

Oregon.

JASPER, Lane Co., August 4.—The prospects for crops in my neighborhood are not as good as last year. Fall and winter wheat will make an average of 15 bushels per acre, while Spring will not make more than half a crop. Oats ditto. Barley will make an average. Hay not half a crop. Potatoes an average. Apples, pears and all orchard fruits not more than a fourth of a crop. Hops are about as good as last year. W. F. S.

Pennsylvania.

READING, Berks Co., Aug. 16.—Reports coming in from the country districts to-day show that last night's cloudburst and storm were unprecedented. Many thousand bushels of unripe fruit are now lying on the ground. The streets of Hamburg presented the appearance of rivers. Hundreds of cellars were flooded, wagons and agricultural implements were washed from farm yards into the Schuylkill and carried away. Corn fields were washed away, leaving not a vestige of the crops, and tobacco fields were riddled. The fruit crops are a total loss. Three barns valued at $12,000 were struck by lightning and destroyed, together with several animals and the roofs of three churches in the western section of Berks County were partially blown off. L. M.



ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

LAYERING GRAPE-VINES.

S. R. Sanborn, N. Y.—One of the papers I take recommends us to grow grape-vine layers from the wood of this season's growth, and I would like to know what the RURAL says of this course, having more faith in its teachings.

ANS.—We cannot recommend the growing of layers from green wood or that of the present season's growth. It may be admissible where no other wood can be got to the ground, and it is very necessary to grow from a particular vine; but such plants are never so strong, require extra care for a year or two, and are much more liable to insect attacks and disease. We would use as layers only wood of last year's growth from which canes have grown this year. A trench about four inches deep should be dug along where the cane can be lowered into it. When the canes of this year's growth have reached a length of fifteen to eighteen inches, the cane bearing these should be placed in the bottom of the trench and fastened end down, if necessary, with pegs of wood or twigs or anything that will hold them down. The trench should then be filled with fine soil, which should be packed closely around each young shoot, care being taken to have as few leaves as possible covered. The roots will mostly grow from the old wood just at the place from which the young cane grew. It is now quite too late for layering. It should be done in June or the first of July when done in a large way. When anybody tells you that grape-vines grown from green wood are in any way better than those from older wood don't believe him; he doesn't know what he is talking about.

MULCH IN A VINEYARD.

F. E. H., Canker City, Kans.—Which is the better treatment for a vineyard—to cover the whole ground with a heavy mulch, dispensing with cultivation; or to mulch along the row and cultivate between the rows? Soil a loam, with heavy clay subsoil so that water stands within one to one and a half foot of the surface for some weeks in Spring. We often have drought in mid-summer. Is there a better way than either of the above?

ANS.—Mulching is, at the very best, but an indifferent substitute for cultivation. Whether as a stimulus of the growth, or as a protection against drought, a clean or well pulverized surface is always preferable; although in case of long-continued dry, hot weather the addition of a mulch upon a well pulverized surface, will doubtless prove beneficial. There is grave doubt if the health and vigor of a vineyard can be maintained upon a soil in which water stands for a considerable period so near the surface. Such soil should have been thoroughly underdrained, to a depth of at least three, or three and one half feet; and the subsoil well broken up for fully one-half that depth, before planting the vineyard, if the best results are to be had.

TRANSPLANTING APPLE TREES.

A. S., Beechwood, Pa.—About four years ago I ignorantly set out some apple trees in a bad situation; would it be safe to remove them now to a better place; and should this be done in the Fall or Spring?

ANS.—We should remove them. For your location probably Fall would be the better time. Prepare ample holes and preserve all the roots you possibly can. Don't expose the roots to the sun or wind for a moment if it can be avoided. Cover them with blankets as soon as the tree is dug out. Use the finest soil about the roots, the poorest on top. When the roots are *covered* pour water enough in the holes to puddle the entire mass of soil. Then fill to the surface and compact it the *next* day as firmly as you choose and again fill to the surface with soil, this time leaving it mellow. Cut the trees back to within a foot of the main stems and stake if necessary.

Miscellaneous.

JAMESBURG, N. J.—In this vicinty we are using for clover marl which is said to contain from 8 to 10 per cent. of potash and about two per cent. of phosphoric acid. To receive marked benefit we have to apply from 75 to 100 bushels per acre, costing seven cents per bushel delivered at the station. One man can draw and spread 100 bushels per day. Would it not be cheaper to use muriate of potash, applying the worth of the same amount in money to the acre? If so, at what time should it be sown?

ANS.—Our friend does not tell us in what form the potash exists in the marl. There is at least one cent per pound difference in price between muriate and sulphate. In a loose way of figuring, we should say that the potash in the marl would cost just about the same as the potash in good muriate of potash when the cost of carting and spreading is taken into the account. The phosphoric acid is probably not worth more than two cents per pound, being insoluble. We should prefer to use either kainit, sulphate or muriate of potash, for the potash; and raw bone flour for the phosphoric acid. The bone would also give some nitrogen.

W. M. P., Bluff Point, N. Y.—In our vineyards we encourage the growth of Canada Thistles for winter protection and also for their manurial and mechanical effect upon the soil. How do they compare with clover as a manurial crop.

ANS.—In mechanical effect upon the soil we cannot see why Canada Thistles would not be as good as the same bulk of clover and also in adding carbon to the soil; but as a gatherer of ammonia, both in foliage and root, clover is much superior. The thistles have the advantage in so much that they can be plowed down two or three times during the Summer and they will spring up rank and strong while the clover could hardly be grown to sufficient size to add much if anything to the soil, unless allowed to grow into the second year more or less. We should greatly prefer clean culture during the earlier part of the Summer and then the sowing of rye as a winter protection. It is at least much pleasanter to work among and over it, and it will have as good a mechanical effect upon the soil.

A. S. S., N. Greenfield, Wis.—What are the varieties of barley, heads of which are inclosed?

ANS.—It is very difficult to tell the variety of grain from only a portion of a single head, and without leaf or stalk, but we think No. 1 is the Manshury. The kernels toward the the upper portion of the head are smaller and longer than the others, and in general have the same appearance as that variety. No 2 looks like an inferior head of Manshury, or else common six-rowed.

G. K., Zanesville, Ohio.—Does the RURAL reserve the right to include in its Free Seed Distribution any of the plants sent to the Experiment Farm for testing purposes?

ANS.—By no means. We fancy that plants or seeds sent to the Rural Grounds to be tested are as safe as if in the originators' grounds. We have no more right to give them away than to sell them. It would be an unpardonable breach of trust were we to do either.

P. W. J., Pontiac, Mich.—The chief works on "wine-making on a large or small scale," are "French Wines and Vineyards," an English work; Haraszthy's "Grape Culture, Wines and Wine-making"; Shaw's, "The Wine and its Cellar," Husmann's "Grape Growing and Wine Making." 2. The grass sent for name is Cenchrus tribuloides—Bur Grass, Hedgehog Grass. It is a grievous nuisance and should be extirpated on its first appearance.

L. C. D., Emery, Ill.—1. We do not know of any Sparta Branch Nursery at Sparta, Wis. 2. The common apricot is not hardy enough to do very well in the West, north of Central Illinois, and owing to the curculio is not profitable. The Russian apricot is said to be hardier but has not been thoroughly tested. Trees should not cost more than 25 to 40 cents each.

L. P. N., De. Ruyter.—The box with the beans has not been received; but from your description of the insect coming out of the beans, we have no doubt it is the bean weavil.

R. H., Seneca Falls, N. Y.—To get one of the Government consular reports address Worthington C. Ford, Chief of Bureau of Statistics, Washington, D. C.

S. S. I. F., East Carver, Mass.—The specimens of Arbor-vitae you send us are the seed-bearing vessels or cones.

C. C., Warrenton, N. C.—1. The American News Co. of this city can supply all books. 2. F. S. Gibson, 108 Spruce St., Philadelphia, Pa.

DISCUSSION.

P. O. C., YOUNGSTOWN, OHIO.—"Who have noted any ill effects from eating strawberries"? asks a correspondent in the RURAL for August 7. I have noted both good and ill results. The effects of eating strawberries upon two ladies of different constitutions during the season of 1885, were different to a very marked degree. The younger lady weighed about 180 pounds, and was 39 years old. The other weighed about 90 pounds, and was 79 years old. The system of the younger and more corpulent lady was strongly acidulous, while that of the elder was alkaline. The acidity of the strawberries aggravated the case of the younger lady, completely disarranging the digestive organs, and producing a severe case of irritation of the kidneys. The elderly lady feasted and fattened upon the delicious fruit. In fact her health was greatly improved. The younger lady was compelled to use a corrective under the advise of a physician, who prescribed borax water, flax-seed tea, and abstaining from further use of the berry. Both cases occurred under my own observation, and aptly illustrate the chemical axiom that an acid will neutralize an alkali, and *vice versa*.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, AUGUST 28, 1886.

Please send all fruits and perishable articles to the editor, River Edge, Bergen Co., New Jersey.

The Rural's statement that the new tomatoes Mikado and Turner's Hybrid are the same will not be disputed. The plants are highly productive, the tomatoes very large—sometimes quite smooth—but *generally* as irregular as the fruit of the old Trophy.

August 15: The Jessica (white) grape is fruiting at the Rural Grounds for the first. The berries are beginning to ripen the earliest of any we have ever raised unless it may be those of the Early Victor, which is also fruiting for the first. It is a close race between them.

There is an Osage Orange growing in the New York Central Park that, six inches from the ground, measures six feet in circumference, with a round head about 20 feet high. The foliage is dense, and this Osage Orange is one of the finest tree specimens in the whole park.

☞ *The SUPPLEMENT of the RURAL NEW-YORKER Special to be issued about Sept. 4th will be mailed to subscribers and all applicants from its date until next May or June.*

Advertisements for the Supplement should be sent in at once. The price will be 50 cents per line to all. Advertising patrons need never apply to us for special rates. We have no special rates.

One hundred thousand dollars for the Washington seed distribution, two-thirds of the seed to be distributed by members of Congress; for forestry, $7,000; for silk culture, $10,000! We conscientiously believe that the Rural's little seed distributions have done more good to the country during the past eight years than have those of the Washington politician-humbug affair. Had the one hundred thousand been appropriated to forestry, and the silk business been ignored, members of Congress would have shown some sense.

From seed *gathered* and sown in early May we have now lilacs a foot high. Is there anything in a floral way more delightful than a good specimen of the lilac in full bloom? Is not the delicate fragrance of its abundant panicles enough to repay one for the cost of raising lilacs about the home? Lilacs vary considerably from seed in habit and foliage, as well as in the color of the flowers and size of the panicles. The seeds may be collected and sown now. They will germinate in 10 days and the plants will winter safely if lightly covered with straw or loose manure.

Seven of the eight Anarchists on trial for weeks at Chicago were yesterday condemned to death. For all who respect law and order this is the best intelligence we have printed for many a day. These wretches gloried in their antagonism to law, reason, decency and the peace and welfare of the civilized world, and in the pursuit of their nefarious designs wantonly and willfully destroyed valuable lives for which their own worthless lives are but a poor compensation. Their execution on the gallows will be a stern warning to a class of exotic criminals for whom there is no room in any corner of this broad land. Would that the punishment could be inflicted promptly, and that the force of the lesson should not be weakened by the law's delays!

The majority of the fair catalogues come to us this year with the words "no liquors allowed on the grounds" plainly printed. There will be more temperance fairs this year than ever before. This fact is very gratifying. The temperance sentiment of the country is growing stronger and stronger. Men who sneered at it a few years ago are now afraid of it. The coming generation of farmers will carry temperance so far into politics that politicians will be the most ardent advocates of reform. What do the managers of our New York State Fair propose to do about the saloon business this year? They have made a heap of money out of "beer privileges" in times past. They ought to be able to get along without liquor this year. We shall see what they will do.

CONDITIONS NECESSARY FOR MAXIMUM POTATO YIELDS.

We are now digging and weighing the potatoes of our rich-soil plot, where, perhaps, about 500 different kinds have been raised during the past eight years. The average yield seems to increase every year, and the question arises whether it would not pay to treat large areas just the same as this little plot has been treated. The entire yield this year will certainly exceed 800 bushels to the acre. Our treatment of this land seems to indicate that potatoes, to give maximum yields, not only need *complete* fertilizers, but that they need every *form* of plant food, the effects of which the chemist may not be able either to estimate or recognize. We have used upon this plot every available form of potash, phosphoric acid and nitrogen, as well as sulphur, magnesia, salt, lime, sand and muck.

No matter, however, what the soil is made up of, if we could raise such immense potato crops year after year evidently it must not only be retentive and moist, but also well drained. Such land is rarely to be found. But, when it *is* found, we should not, with our present experience, hesitate to supply the conditions of this plot; and we should feel that the money could scarcely be more wisely invested upon the farm.

THE EFFECT OF EMASCULATION ON THE YIELD OF CORN.

If any reader were to doubt our statement that cutting off the tassels of the corn plant induces the rapid development of "sets" which in many cases would otherwise remain dormant, he should try the experiment. We are thinking, therefore, whether it does not follow that a field of corn if every alternate plant were so treated would not produce more grain than if all the tassels were left in the usual way. The writer first observed this effect of destroying the male flowers (or "tassels") several years ago. The variety which we have been working to improve for 10 years is always planted in a plot of about one-tenth of an acre.

When the tassel first appears and before the pollen is ripe, the plant is examined. If it suckers, is too tall, or the sets do not develop, or only the higher sets develop, or the stalk itself is too tall, the tassel is cut off in order that such plants may not mate with others which are less faulty. It would appear that the plant vigor required in perfecting the tassel must be very great, for no sooner is it cut off than not only do the sets which may have shown themselves grow rapidly, but other sets are forced into growth. We have plants which have been thus treated with from three to eight sets all showing silk, though the sets had not appeared above the sheath when the tassels were cut off.

Evidently the plant nourishment which was required to mature the male flowers was, after emasculation, at once directed to the female flowers.

If every other plant in a corn-field were deprived of its tassels, no doubt the perfect plants would furnish pollen enough for all. Whether the yield of grain would be increased or not is a fit subject for experimentation.

THE "WHEEL."

The Agricultural Wheel is an organization of farmers started by three of them in Prairie County, Arkansas, in 1882. It is devoted to the promotion of the special interests of the farming class, and none but farmers have been hitherto admitted to membership. Within a year of its organization every county in the State had a Wheel of its own. In 1885 the State Wheel was very much strengthened by the consolidation with it of the Brothers of Freedom, an organization like that of the Grangers. There are now over 1,200 Wheels in the State, with a membership of 55,000.

In June last a State convention of Wheelers at Little Rock nominated a State ticket, though many members objected to enter politics as a party, and bolted, though willing to become factors, as Wheelers, in local, county and State elections. All the nominees declined, while generally expressing sympathy with the movement. Another convention was held at Litchfield, Ark., on July 28, when a National Wheel was formed, representatives from Missouri, Tennessee, Texas and Kentucky being present. After adjournment, the Executive Committee of the State Wheel met the other day and nominated a State ticket. If it receives the full Wheeler vote it is thought it will be elected; and in spite of much dissatisfaction it is expected to receive 20,000 votes.

The appearance of the Wheel in politics indicates a tendency on the part of the farmers of the country to break away from old political connections and to organize on new lines. This is the first agricultural organization that has taken any prominent part in State politics since the Granger movement against railroad extortion in the Northwest. It is rolling rapidly over the South, where it is meeting with much opposition from the Democratic party, as its members are drawn chiefly from that organization. Its independence of old parties is salutary, and will do much to promote a much needed reorganization of parties in the South.

THE DROUGHT IN WESTERN TEXAS.

Two or three weeks ago telegrams from several parts of Western Texas greatly belittled the injury which numerous previous telegrams had reported to have been done to the live stock and agricultural interests of that section by the long-continued drought. At the time we ventured to doubt the truth of the denials in face of reiterated accounts of the immense damage done. We now learn that in response to an earnest appeal from Gov. Ireland, a movement has been quietly started in most of the cities of the State for the relief of the people rendered destitute by the drought. The Governor is severely criticized by many for having issued the proclamation, as most Texans think it will tend to keep many actual settlers out of the State. In Shackleford County, where farmers were entirely dependent on their crops, employment has been furnished by the County Commissioners by giving farmers work on the public roads. A fund has also been raised to be lent to farmers without interest to enable them to buy seed this Fall. Other counties are likely to follow the same course. The distressed people of Callihan County, who have lost their cereal crops, cotton, hay and grass, driven to desperation by want, appeal to the world for help.

There are 10 counties in the State where absolute destitution prevails. Provisions are being sent forward from various towns in Northern Texas; but everything is being done very quietly so as not to alarm intending settlers. Cattle, sheep and horses have been nearly the only sufferers in the stock-raising counties, and of these the deaths have been very heavy; but men, women and children have been the great sufferers in the agricultural counties of the drought-afflicted section. It may possibly be a shrewd measure, but it can hardly be an honest one, for a large State like Texas to try to conceal for selfishly deceptive purposes the extent of this disaster. With States more emphatically than even with individuals, "honesty is the best policy."

DANGER TO THE WATER SUPPLY OF CALIFORNIA.

While the miners and farmers of California are hotly disputing about the right to use the rivers of the State for hydraulic power or irrigation, a third class is destroying the capacity of the rivers to furnish any water at all during the summer months, when water is most essential. There is no summer rain in the Golden State, and during the long, hot, dry, brown Summer both farmers and miners are entirely dependent on the supply of water stored in the basins from which the rivers are supplied. These storage basins are the coniferous forests that cover the California mountains. If these are allowed to remain in something like their natural condition, the heavy snows on the mountains, gradually melting, will slowly pass down through the streams the year round. In the census year California had 4,152,349 sheep—more than any other State except Ohio. For many years a great part of these, as well as countless herds of cattle and goats, are driven every Summer up from the parched valleys into the moist mountain meadows and woods.

There they eat up every blade of grass and stamp down and gnaw away every bush and young tree along the entire length of the Sierras, thus ruining the reproductive power of the forests. After the destruction of the grasses and shrubs, the shepherds and herdsmen, for the purpose of more rapidly renewing the supply, set fire to the forests in hundreds of places, so as to get rid of the shade which checks vegetation. Thus, what with the grazing of stock, the reckless fires of the stockmen, and the wasteful ways of the lumbermen, the mighty forests of California are disappearing with alarming rapidity. The destruction of the forest reservoirs will convert the short, deep, rapid California rivers, running through long, narrow, hot, dry valleys, into spring torrents, and leave them dry the rest of the year, and without a permanent summer supply of water the greater part of California will be uninhabitable. Before deciding to what use the rivers of the State are to be applied, would it not be wise in the Legislature to take measures to secure their permanence?

BREVITIES.

Moore's Early is now (Aug. 18) beginning to ripen.

We are planting early peas as an experiment. We presume that they will mildew.

Are you budding any fruit or ornamental trees? Now is the time. See how many pears or apples you can bud upon a single tree—just for the fun of it—how many kinds of roses upon a single bush. Bud the white lilac upon the purple, or *vice versa*; the privet upon the lilac; the double red-flowering thorn upon the white; the different colored Japan quinces upon the white.

Those of our friends who can afford the expense should now be thinking of planting hardy bulbs. Let the soil be mellow, deep and rich. Hyacinths should be planted deep and not disturbed until they fail. Good bulbs will bloom three to four years. Tulips may remain two years in beds. Then it is best to take them up after the leaves fade in early Summer, separate them and replant.

This is the season when full crop reports are of the greatest use to those who have produce to sell. Last week we gave the gist of the latest and most trustworthy reports on cereals; this week we do the same for fruits, potatoes, tobacco, etc. Special attention will be given to this business every week, until most of the marketable produce has passed from the growers' hands.

In Germany great care is taken to prevent the spread of trichinosis among the people, who are greatly addicted to the eating of raw or underdone pork in the shape of ham, sausage, etc. Every hog slaughtered for market is carefully examined by an official microscopist, whose duty it is to detect trichinæ, and by condemning every affected animal prevent the disease. If this occurs from the use of pork examined by any microscopist, he is held responsible and is punished. Couldn't even this wide-awake Republic learn a lesson from this "primitive custom?"

The Grain Shippers' Association, of Kansas, includes nearly every big grain buyer in the State. It was organized in a small way two years ago; but the low prices of wheat and other farm produce of late have increased the necessity for such an organization, and its strength has been greatly augmented within the last five months. Delegates from it visited St. Louis the other day, and tried to get such rates from the Missouri Pacific Railroad as would permit them to ship the entire grain crop of Kansas to St. Louis. The result of their negotiations is not yet known. Why cannot the farmers in every section form organizations to secure low rates of transportation on their produce to market? Such organizations would very likely be successful wherever there is any competition in transportation, either by rail, river or canal. If wide-spreading, like the Kansas association, it could, probably, often influence rates where there is no competition by bargaining for rates for all its members, competition or no competition. Where this cannot be done by farmers themselves, they should encourage the buyers of their produce to do so; for low rates of freight for the latter will enable them to pay better prices for what they buy.

In 1875 there was inserted in the Nebraska State Constitution a provision that at the general election immediately preceding the expiration of the term of a United States Senator from that State, the electors should express by ballot their preference for some person for the office. For the ten years since then no action had been taken on this provision until last Monday, when Senator Van Wyck, who is a candidate for re-election, in a spirited manifesto appealed to the people for an expression of their preference under the proviso. This will be the first instance of a direct vote of the people of any State for a United States Senator, and it is supposed that the choice thus made will, as a matter of honor, be binding on the next Legislature elected. The Senator well says that, "while the National Senate represents the sovereignty of the States, each Senator should be the true representative of the sovereign people of the Commonwealth." There has of late been a great deal of scandal with regard to the election of United States Senators by the Legislatures of the various States. The members of these Legislatures are comparatively few, and are, therefore, much more easily influenced in their choice by pressure from wealthy individuals or corporations, as well as by direct or indirect bribery or other corrupt incentives, than the great body of electors who choose them. The composition of the Senate, and its action with regard to many measures affecting corporate interests brought before it, lead to the conclusion that undue influence has often been exercised by these forces in their election. On direct appeal to the people, like that just made in Nebraska, their choice would be directly indicated, and the danger from improper influences in the election of United States Senators would be minimized without any constitutional change in the mode of electing them.

Indust'l Societies.

SOCIETY NOTES.

THE American Institute of this city will hold its 55th annual exhibition from September 29th to December 4th.

THE New York State Dairyman's Association will hold its annual convention at Norwich, Chenango County, December 14th.

THE exhibition of the Massachusetts Horticultural Society last week was largely given up to flowers. Some magnificent gladioli were shown, one long table running the entire length of the room being given up to these beautiful flowers. They were of innumerable colors and shades. A collection of 30 or more vases of sweet peas was much admired. The fruit exhibition was small but fine. William's Favorite apple and Rostiezer, Tyson and Clapp's Favorite pears were most numerous. Two magnificent bunches of Black Hamburg grapes, raised in a hot-house, attracted much attention. The Acme tomatoes were very attractive, and the Crosby sweet corn made a good display.

THE Premium List of the Orange County Fair contains the points of excellence in cattle. The "scales of points" for use in judging Jerseys, Guernseys, Holstein-Friesians and Ayrshires are given. A good move. Orange County is essentially a dairy district, and it is impossible to do too much to develop the milk and butter qualities of the cattle.

AT many fairs a new class has been opened, viz., one for dogs. The Tri-State Fair calls attention to a "canine congress," and other organizations are preparing to recognize the dog as a legitimate member of the farm family. This plan may result in much good. A good, well trained dog stands pre-eminent in the brute creation as the friend of man. He stands above some men in intelligence and affectionate regard. Such exhibitions will tend to show the public what care and training will do for the dog, and will serve to point out the deficiencies of the savage mongrel curs for which the farmer should have nothing but a charge of shot.

AT the recent meeting of the American Society of Microscopists held at Chatauqua, N. Y., Dr. Thomas Taylor, of the Department of Agriculture, read a valuable paper on butter fats and oleomargarine. Dr. Taylor has for some years conducted a series of experiments seeking to discover a sure test for oleomargarine. He discovered that there was a distinct difference between crystals of butter and those of other fats. This difference is shown by a powerful microscope, and it was thought by many that the surest and simplest test for bogus butter had been found. Recently Prof. Weber, another distinguished scientist, has declared that in samples of oleomargarine sent to him for examination, he can find no great difference between the physical characteristics of the fat globules of butter and its substitutes. This called out a reply from Dr. Taylor, in which he practically repeats his statements and combats the theory of Prof. Weber. He insists that the butter crystal has several peculiar characteristics which he has not yet found in connection with any other crystals of fat, animal or vegetable. Dr. Taylor's argument was elaborate and strong.

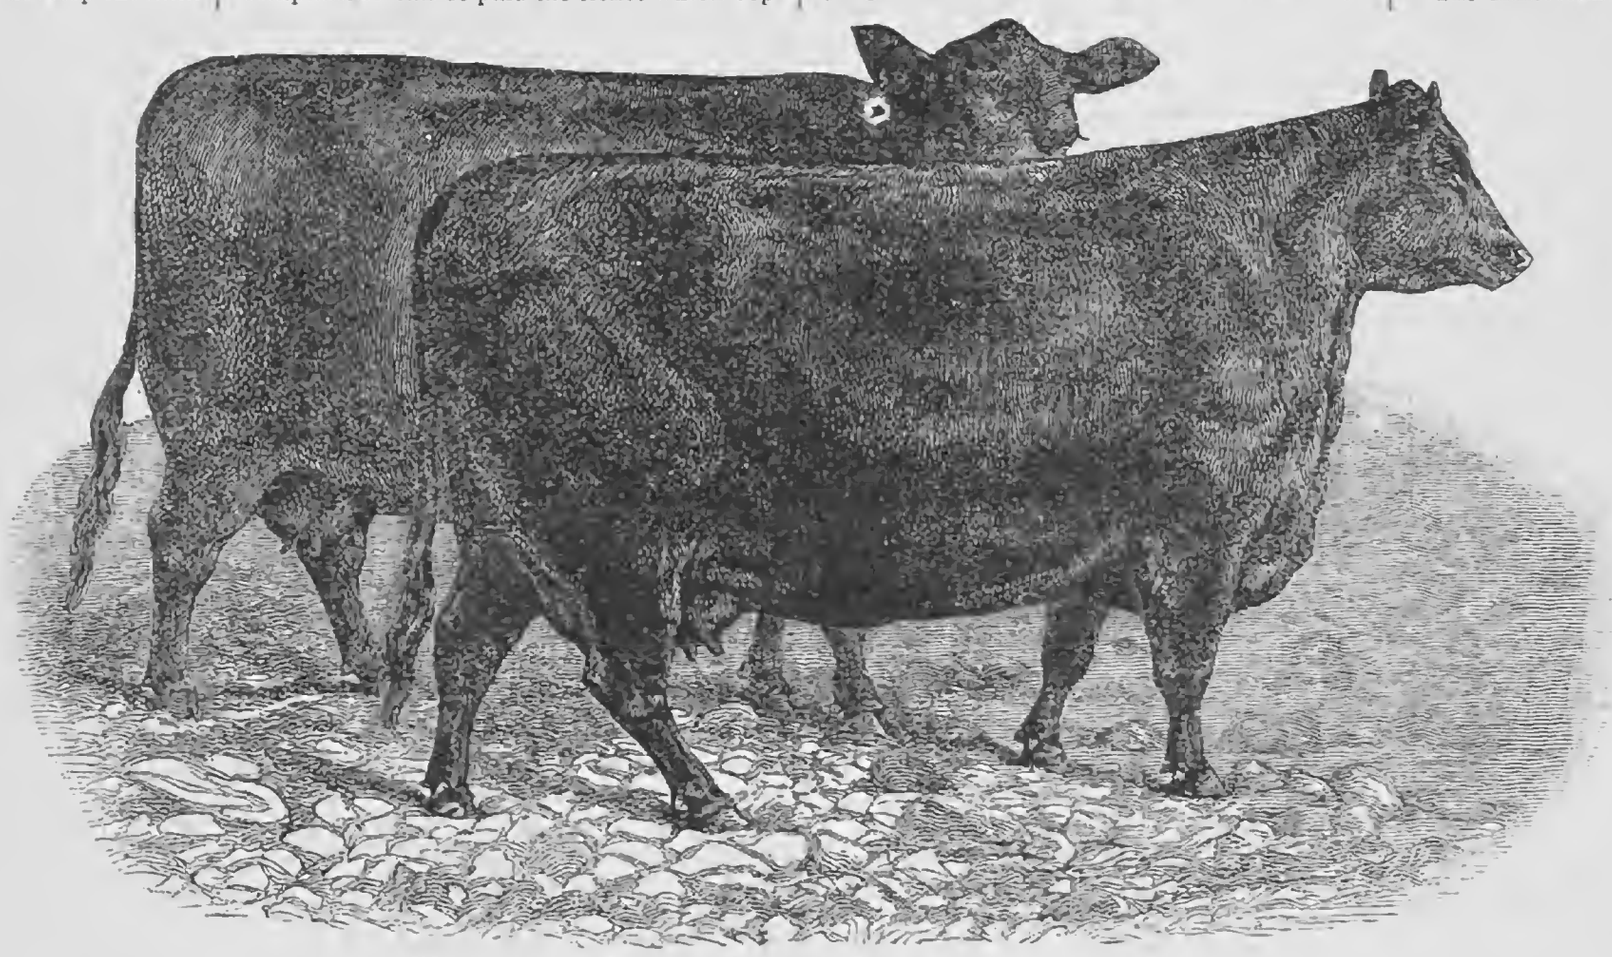
THE Holstein-Friesian Association of America offer special premiums for butter, cheese and fat cattle to encourage breeders to push the black-and-white breed into notice. All premiums awarded for butter or cheese at the Massachusetts, New York, Ohio, Wisconsin, Minnesota, Illinois, and Iowa State fairs, won by Holstein-Friesian cows will be duplicated. Premiums are offered at the Fat Stock show for beef Holstein-Friesians, both thoroughbreds and grades. These premiums will also be duplicated. Full particulars may be obtained from T. B. Wales, Jr., Iowa City, Iowa.

THE Mercer Co. Agricultural Fair Association will hold its first fair at Trenton, N. J., Oct. 5—8. This is a new association but it starts right. The constitution informs us that: "No races, trots or trials of speed for money or other valuable things offered or provided by any person other than the Association shall be allowed upon the fair grounds, nor will any gambling or lottery schemes of any kind or liquor selling—beer or strong drink—be tolerated." The constitution is an admirable one.

THE coming meeting of the American Horticultural Society promises to be a great success. The meeting will be held at Cleveland, Ohio, September 7. Horticulturists from all over the country will be present. Twenty-five papers will be read by men well up in the profession. Various excursions have been planned about Cleveland. The business meetings of the society will be held in the hall of the Board of Trade. The best hotels in the city offer reduced rates.

THE Illinois State Board of Agriculture issue a neat pamphlet giving dates and other necessary information relating to the various exhibitions under their direction. The Illinois State Fair will be held at Chicago, September 6-10. The Fat Stock show, the American Dairy Show and the American Horse Show will be held November 8-19. Entries are to be made by writing C. F. Mills, Springfield, Ills. The Fat Stock Show this year promises to be the most remarkable agricultural exhibition ever held in this country.

THE premium list of the Nebraska State Fair, issued by Sec. Rob't. W. Furnas, is the neatest we have ever yet seen. The same compliment can be paid the ticket which represents a half-husked ear of golden corn. Those who want to learn how to conduct a fair will do well to secure this little pamphlet. We consider it an excellent plan for the managers of fairs to secure the catalogues, and premium lists of other associations. There is always something that somebody else has thought of that can be made useful at home. At the Nebraska fair, liquors and gambling devices are not only prohibited on the grounds, but they are not allowed within 40 rods of them. We are sorry to note, however, that "Roman Chariot Races" and kindred spectacles are advertised. The classes for educational display, ladies' work, art and housework are ample. The residence of the Secretary is at Brownville, Neb.



ABERDEEN-ANGUS COWS. Fig. 349. Re-engraved from the London Live Stock Journal. (See page 558.)

Various.

THE QUESTION OF CALIFORNIA IRRIGATION.

I AM not a lawyer, and I have no interest in the irrigation question at present so prominent in the affairs of our friends of the Pacific Slope, except as a general friend of law and justice between men, but I fear the RURAL'S position in the editorial entitled "Irrigation in California," is not based upon equity or sound law. The men who contest the right to divert the waters of the rivers lying along the borders of their lands, own their lands in fee simple with all the privileges and appurtenances thereto belonging. The only right the State has to them is that of eminent domain, under which it taxes them, and may take them for public but not for private purposes. But it has not the right to take them even for public purposes without first assessing and paying the damages. The State cannot constitutionally pass any law to deprive these owners of their rights under the laws existing at the time their rights were acquired. I have no right, much less has any influential journal the right to place expediency above law, and counsel disobedience or resistance to existiug law, or the enacting of unjust laws. It does not make any differeuce what laws they may have in India or any other country under the sun. The common law is constitutionally adopted in this country in the absence of statutory enactments, and a common law title to property once acquired cannot be set aside by any *ex post-facto* enactment.

The conflict between might and right, which is every day coming to the front in some part of the country, should warn every honest man to stand up, firm as a rock, for the defence of every vested right. To yield one point to-day is to yield two to-morrow. God's just displeasure with a compromising nation has shaken it to its very foundation once, and shall we not heed the warnings of the coming storm? California would much better let every irrigated acre become desert than imperil her very existence by wronging one portion of her population at the demand of another.

Every civilized nation, whatever its form of government, recognizes in its judiciary the conservator of the people's rights. But in these times of terrible unrest, dissatisfied men appeal their cases without scruple from the highest courts to the most ignorant and prejudiced of the populace. The purest and truest judges are held up to popular odium, and appeals are made to the ignorant and unthinking to kick them out. To whom shall the people look for justice, when the populace dictate the decisions of the highest courts of the State? It is a terrible misfortune to a State that any considerable change in the organization of its courts should rest in the hands of the populace in times of great popular excitement. The appeals which are made to the passions and prejudices of men at such times, are more subversive of Republican institutions in their tendencies than all the teachings of avowed Anarchists. Men often offend thoughtlessly against law and right, especially when there is a popular drift in the wrong direction, and it stands us all in hand to look well into a subject before condemning the deliberate action of those who have had the largest possible opportunity of acquiring correct information in regard to it. California is fortunate in having a Legislature already elected which may reasonably be expected to act with more deliberation, and under a deeper sense of justice to all parties, than one chosen in the present disordered state of public sentiment. Let us hope that it may be fortunate enough to adjust the difficulty upon principles of justice and equity to all parties interested. Possibly the Legislature may be able to satisfy itself that irrigation is of so much importance to the State that it will justify itself in pronouncing it a public use of the water, and condemn it under the law of eminent domain. This would be straining the point tremendously, but it is the only way out of the difficulty that I can see. Even in that case, the State would have to stand between the parties in interest and adjust the damages. No settlement of the difficulty not based upon the principles of right, will ever stand. The interests involved are too stupendous to be trampled under foot. God reigns and the right always comes to the top sooner or later.

O. S. BLISS.

R. N.-Y. The RURAL'S position is that where the interests and welfare of the great majority of the people of any State conflict with those of a small minority, those of the latter should yield; but without entailing any unjust loss. The right to the waters of a stream or lake under even a fee simple ownership of the abutting land is quite restricted according to the common law. The riparian owner has only a right to use the water for any reasonable purpose not inconsistent with a similar right in the owners of the land above, below and opposite him. He has no right to make such use of the water as would sensibly and injuriously affect its volume. Even this is a mere privilege running with the land, and not a property in the water itself.

Whatever right he may have in the water, however, there is no doubt that the State has the right to take it for public use, compensating the riparian owners for whatever legal claims they may have on it. The State does this in case of canals for the purpose of transportation; why shouldn't it do it in case of canals for the purpose of irrigation? If it does so in a constitutional way, how can it be against law or equity? If it does so in an unconstitutional way, the courts of the State will declare the law invalid; and if they fail to do so, is there not an appeal to the U. S. Supreme Court? In no case, therefore, can the legal rights of the property owner be infringed by any legislation counseled by the RURAL.

The American common law governing this subject comes from England, and it certainly seems reasonable that, in interpreting it, California judges should have regard to the interpretation placed upon it by English judges in English possessions where the conditions are the same as those in California.

In past ages so much importance was given to "vested rights," that little or no importance was given to any other rights. As the world advances, however, the former are losing a good deal of their sacred, inviolable character, and the latter are attracting much more attention. When Bismarck the other day decreed that all the Polish landowners must quit Posen by a specified date, what regard was paid to their "vested rights" in the land which he insisted they should sell at whatever price they could get? When the British Parliament a short time back fixed the maximum rent for Irish land, what consideration did it show in this *ex post-facto* legislation for the "vested rights" of rack-renting landlords? There is just now across the water a good deal of talk of compelling the land-owners of Ireland to sell their property outright at a specified figure, and it is the cost of the measure in money, not in morals, that stands in the way.

A high respect for the judges of the country is quite desirable. In England a good deal of it arises from the fact that the judges there are appointed, not elected: that they hold office for life, not for a term; that much official homage is shown them in the courts and on the road: and that wig and gown distinguish them from the commonalty. All these adventitious sources of reverence are lacking in this country. Our judges must depend on their own learning, intelligence, impartiality, and incorruptibility to secure public regard. They are elected by the people from among the people, and after a time return to the people. While in office no antiquated trappings or special ceremonial distinguish them from their fellow citizens. It is good for the country that the vast majority of them are worthy of high respect; but there is nothing sacred or infallible about their decisions. They are reversed every day by higher courts. Where several judges sit in the same court, it is a rare thing to find a unanimity of opinion in any case. In the California Supreme Court, the decision in favor of the riparian owners was made by majority of only one out of nine. If public opinion drifts occasionally in the wrong direction, it drifts much oftener in the right. Why assume that the public opinion of California is drifting in the wrong direction now? A new Legislature will be elected in California in November; are the present members who want to be re-elected less likely to be swayed by public opinion before election than after?

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

WHAT RULES THE WORLD.

They say that man is mighty,
He governs land and sea,
He wields a mighty sceptre,
O'er lesser powers that be;
But a mightier power, and stronger,
Man from his throne has hurled,
"For the hand that rocks the cradle
Is the hand that rules the world."

In deep, mysterious conclave,
'Mid philosophic minds,
Unraveling knotty problems,
His native sphere man finds
Yet all his "ics" and "isms"
To heaven's four winds are hurled,
"For the hand that rocks the cradle
Is the hand that rules the world."

Behold the brave commander,
Staunch 'mid the carnage stand,
Behold the guidon dying,
With the colors in his hand:
Brave men they be, yet craven,
When this banner is unfurled:
"The hand that rocks the cradle
Is the hand that rules the world."

Great statesmen govern nations,
Kings mould a people's fate,
But the unseen hands of velvet
These giants regulate.
The iron arm of fortune
With woman's charm is purled,
"For the hand that rocks the cradle
Is the hand that rules the world."

—*From the American Israelite.*

OF INTEREST TO WOMEN.

An ingenious woman recently made a pretty easel to stand upon the floor, out of swamp cat-tails. Stout ones about four feet long were chosen. The tripod of supports was made of nine cat-tails, three in a bunch, fastened together by almost invisible bouquet wire. The three bunches were fastened together; a bar composed of two cat-tails pointing outward, was placed across about four inches from the bottom. Another bar was placed across higher up, to hold the picture. More cat-tails were laid carefully against the two front pieces of the tripod, to prevent a bare look. An unframed etching was placed on the easel, with a scarf of crimson silk carelessly draped around it. The effect was very good.

English charitable societies make a feature of "lending bags," to be loaned to poor women during confinement. A writer in the London Queen gives the following list of contents, which may be of use to charitably disposed women: Two pairs of cotton sheets, two pillow cases, two night-dresses, a short jacket for sitting up, two nightcaps, two bed-gowns, two flannels; in addition, a flannel petticoat, six squares, a dressing gown made of flannel lined with calico for the mother. For the child, two shirts, two flannel gowns, two binders, four squares, two flannel squares, one head flannel. One pound of yellow soap, some tea, and sugar are generally added. The bag can be kept six weeks; but must be returned with everything clean, and application for the loan to be made two months beforehand. If the articles are returned in a satisfactory state, it is well to give the baby a frock, a flannel petticoat, two pinafores, and one shirt. A jug of gruel two or three times during the first week, and afterwards a good meat dinner, are much appreciated. A card with the list of articles should be placed in the box, and a Bible is sometimes added, also Fuller's-earth, and any useful medicine.

London shops are beginning to display the Indian baskets, such as we see purchased at Niagara.

They are of thin white chip, with a "knobby" surface, made by the plaited lengths being twisted preparatory to being passed through the perpendicular ones. All are finished off with rosettes and tassels of the same. The dried "seg" or rush baskets are the fashionable ones, and this Winter they quite formed one of the principal items in the Christmas gift list. There were long, narrow ones, called knitting baskets, but used by amateur artists for carrying paint brushes: others in the semblance of a crumpled, wide-brimmed hat, spiked on three rush-twisted sticks, forming a tripod; or a French horn supported on some short stout twigs; an upturned beehive, neatly ensconced in the center of crossed sticks; a large leaf folded partially over, with the stalk forming the handle: tall, rounded ones, for waste paper, with a gigantic velveteen butterfly placed on one side, with silk embroidered wire-edged wings. They are all made much in the style of the common rush door-mats, and their beauty lies principally in their novelty. Everybody likes a basket, from the old lady with her hoard of wools to the child with its pebbles and daisies.

A pretty way of brightening up the round baskets, whether Oriental or British, is to make a bag consisting of four pieces of satin, of two colors alternating, such as black and orange, or red and blue, grey and cerise, with a ribbon drawstring of both colors. Square and other shapes have a canvas scarf (such as was used for dress purposes last Summer) arranged round them, caught up with good-sized butterflies made of velveteen, with beads and silk embroidery on their wings and a wire run round: or else with long pointed pieces of plush or velveteen, edged with silk cord or iridescent beads.

THE NEW BABY.

Everyone felt happier at her coming. Pride and prejudice, family jars and family worries, were all subdued and mollified. New hopes and ambitions were awakened; dead-and-gone sensibilities revived. Strange, that all this should be the work of one weaker than the weakest; a hapless little mortal more frail than a month-old kitten. But somehow, a baby does appeal to one's feelings, worn out though they may seem. As Mark Twain feelingly remarks, here we meet on common ground; we have all been babies at some period of our existence.

Woman's divinely maternal instinct, prompting to very genuine "gush" over each individual baby, meets with much masculine comment, more or less good-natured. Perhaps it is rather ridiculous to the superior being to hear each and every babe "mewling and puking in its nurse's arms," described as "just too cute for anything," this phrase being qualified by a shower of chirruping kisses. But we all have our weaknesses, and of this fondness for babies one may say, as Mr. Weller said of his fondness for widows, after all, its an amiable weakness.

And then to watch the baby's growth from day to day; it is to watch the dawning of an immortal soul. A soul given into the mother's, a charge from Him who gave it life—can aught be occasion for more solemn joy? She must think of her charge from day to day—guard it from evil, guide it to good. On her depends the growth of every good impulse—the correction of any inherent perversity. Truly, as our little poem says, "the hand that rocks the cradle is the hand that rules the world." But it is not only the inherited traits of immediate relatives that the mother must take into consideration. The traits of remote and unknown ancestors will crop out, and, alas for poor humanity! they are very often the last one would wish perpetuated. We may fear that our natural perversity is often stronger than our good impulses. So any mother who overcomes noticeable faults in her children may rightly congratulate herself on doing something for posterity. Dr. Oliver Wendell Holmes says of inherited disease, that it may be cured if the doctor is called in time—about 300 years before the patient is born. The same may be very truly said of mental and moral weaknesses. There is one universal rule in the training of children—and that is, that no two can be trained precisely alike. Bringing up children by the rule and plummet is all very well in theory, but it comes but poorly enough in practice. There is one thing, however, we must bear in mind—the necessity of absolute truthfulness and honor in dealing with children. If the child is promised a reward or a punishment nothing should be allowed to prevent the fulfillment in either case. And the many foolish little falsehoods so many—too many mothers use to prevent trouble, should *never* be resorted to, if we wish to preserve the child's integrity.

So the advent of the new baby is a solemn joy, perfecting our character, even as we may develop and perfect the little life entrusted to our care.

CAN MONEY BE MADE BY FARMING IN NEW ENGLAND?

Under the above heading a few weeks since, was a gloomy article that would lead one not familiar with New England farming to think that the bottom had fallen out of old New England as far as that industry was concerned.

But why ask about New England only? Are any of the other States getting such fabulous returns at present that New England is made to seem poor by comparison? If there are, tell us gradually, so that everybody won't start at once, for fear other parts of the country will be left empty. Having spent the greater part of my life in New England, and having also lived in States hundreds of miles from there, and in others nearer, I am ready to answer yes to Claude's question; and I will go further and say that I would select New England in preference to any other section that I know of (and I have lived in several of the garden spots of the U. S.), for the purpose of getting a living, making money and having the most comforts and social advantages.

The fact is, that all sections have some advantages over others which are usually balanced by correspondingly great disadvantages. For instance, some parts of Southern California are considered almost perfect for farming; mild, even climate, good soil, long seasons, large crops, etc.; but in these parts, land with buildings and improvements is valued at $1,000 per acre. In New England 100 acres is considered a proper size for a farm. Now, if a man had money enough to pay for 100 acres at the above prices, why would he want to bother with farming—or any other business—anyway? Ranching on the plains has for some years past brought large returns, but one must be entirely isolated, give up society, all life, except eating and drinking, simply to pile up money. A few years ago, market gardening brought large profits about Norfolk and other Southern cities; but at present competition has so reduced it that there is often not enough received to pay expenses of the crop. Still, there are many in New England who, knowing only the price that retail buyers have to pay for these articles, imagine that the country where they are grown is paved with dollars, and needs only a rake, basket and market wagon to carry off the wealth. Now, let us examine Claude's article, and see if we cannot - partly at least—make it answer itself.

The first illustration is of a family on a heavily mortgaged farm.

Any one familiar with the financial economy of agriculture, knows that a heavy mortgage is one of the most serious drawbacks to farming, and often an absolute bar to success; not only in New England, but in any part of the States. Many of the Rural readers know of farmers who have made partial, or total failure, simply because they paid more for a farm than it was worth, and were obliged to put a large part of payment in shape of a mortgage; and it is very up-hill work trying to carry a two story mortgage on a one story business—of any kind. This is often done by men who have accumulated a few thousands in some other business, and concluding to try farming, select a farm costing about twice the amount of cash they have. Many seemed to think that "war prices" would last, and bought farms at inflated prices, which have tried them sorely to pay for. I have in mind an industrious stone-mason who, on good wages, had accumulated $3,000, and paid $6,000 for a farm hardly worth $4,000, and, of course, gave a mortgage for $3,000. Although a hard worker, there is at least $2,000 dead load, that the farm as a financial investment is not able to carry. If the mortgage had been as it should, for only $1,000, he probably would have soon cleared it, but now the annual interest amounts to such a large part of what the principal should have been, that it is doubtful, with the prices that are now, and have been ruling—if he can ever do more than meet the interest. Claude admits that those who are industrious and economical are successful, and are to people our farms. But at the same time we are led to infer from the first part of Claude's article, that the settlers of New England led an easy life compared with the present generation. But a look at some of the massive stone walls surrounding New England fields, which were built by them in addition to clearing the land, would be apt to dispel any such delusion. They labored 50 years ago under many hardships, that the present generation would think too hard to bear. The fact is New England farmers have more of the comforts and conveniences of life than the average farmers throughout the United States.

It is quite a common trait of human nature to be wishing for something that we do not have. This tendency has operated quite largely as a cause of failure in New England and elsewhere. There has been a tendency in many farmers, both in good circumstances and otherwise, to hold up to their children's view; the idea that a mercantile or professional life was an easier road to wealth and more genteel than farming; and, educating them for that end, the parents were looking forward to the time when they could retire and follow the children to the village or city. It is needless to say that success ought not to be expected, when, the heart, mind, and ambition are elsewhere. This craze for gentility and ease has placed many a mortgage on farms once free from debt, that never has been removed since.

On the other hand, I can point to farmers in New England, many of whom started a few years ago with small amounts, sometimes nothing, and are to day making money, are young yet, while they live well and are happy. One young farmer married about 12 years ago on a very small capital; and for many years since has saved $500 in cash, besides all expenses of living, raising a family, and there are fair prospects of his being able to do as well by his children as those 50 years ago whom Claude mentions. This is certainly better than many mechanics do on $3 a day. Another case is of a widow, left about the same time, with six children, from 15 years to 15 months of age. All have not only given, and are giving all of the children a good education, but have increased the fertility of the farms, repaired buildings and built new ones, cleared off brush from pastures, and added to the number of stock. They have improved tools, planted a variety of fruits, etc., with a view to increased health and pleasure, which have also proved a source of considerable revenue as well. They have dressed well, and lived as well as, or better than their neighbors, entertained many friends, and made some money. Of course *all* of these families have *worked* for their success. No rational person expects success in these times in any other way. Our most successful business men do not sit in the back door, and let their business care for itself. Neither can we hope to make money by farming in New England, or elsewhere by sitting on the fence and letting the farm run itself.

But to those who are willing to gain honest success, by work, and who will use the same forethought, good judgment, and push, that are requisite in any other business to make a success, I am ready to say, that money can surely be made by farming in New England.

Everett E. Brown.

GOLDEN GRAINS.

Colton says: "that those who have finished by making all others think with them, have usually been those who began by daring to think for themselves."....

A contemporary wisely advises travel because "a too continuous residence in one place conduces to provincialism, and a community has made a great step in advance when it recognizes the fact that its own corner of the earth, however agreeable, is not absolutely the centre."....

A correspondent of the Inter-Ocean who is a boycotter, wants workingmen to boycott every saloon kept open over eight hours. He thinks they have no more right to work 18 hours than other people....

If a man empties his purse into his head, no man can take it away from him. An investment in knowledge always pays the best interest....

The warm sunshine and the gentle zephyr may melt the glacier which has bid defiance to the howling tempest; so the voice of kindness will touch the heart which no severity could subdue....

Charlotte Bronte says: "I consider there is no more respectable character on earth than an unmarried woman who makes her own way through life, quietly, without support of husband or brother, and who retains in her possession a well regulated mind, a disposition to enjoy simple pleasures, and fortitude to support inevitable pains, and sympathy with the sufferings of others."....

He who strives after a long and pleasant form of life, must seek to obtain continued equanimity....

A celebrated writer says: "We never see a tear in the eye but we are reminded of a warm heart."....

Whatever else we neglect let us keep up the habit of communion with God. Prayer is the key of the position....

Lose not thine own for want of asking for it; 'twill get thee no thanks....

At a little gathering of young folks in North Carolina last Summer there was a new-fledged Presbyterian minister present, who, more mindful of fun than clerical dignity, amused the company with sundry pranks of a very unclerical character, winding up by tossing a piece of watermelon in the air and catching it in his mouth. At the conclusion of this dexterous feat he proposed that the hat should be handed around for his benefit, when a young lady from Richmond quietly remarked, "Mr. M., in our city the monkey hands around the hat himself." The young man subsided.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Home is not a name, nor a form, nor a routine. It is a spirit, a presence, a principle. Material and method will not, and cannot make it. It must get its light and sweetness from those who inhabit it, from flowers and sunshine, from the sympathetic natures which, in the exercise of sympathy, can lay aside the tyranny of the broom and the awful duty of endless scrubbing.

THE POETRY OF DINING.

A VEGETARIAN DINNER AND ITS DELIGHTS.

Last week I had the pleasure of partaking of a vegetarian dinner that was quite enough to make a less enthusiastic person than myself fore-swear forever the vulgar charms of "roast and boiled," or the treacherous ones of French side dishes.

A Kentuckian's breakfast is said to be "three

whisky cocktails and a chew of tobacco," and I must confess that I had some curiosity to see what people who ate neither "fish, flesh nor fowl" would have for dinner. That theirs was not a starvation diet, the well-rounded form of my hostess, and the plump and rosy cheeks of her daughter, could testify. As the dinner hour approached, I could not help noticing that the coming event of this dinner did not cast its shadow before, which is too commonly the case in American houses, and European ones, too, for aught I know. Many an owner of a classical stomach has had his appetite knocked from under him by the smell of a cooking dinner. In my friend's house this was conspicuous by its absence, although as we neared the dining-room there were faint and delicious odors from the fresh vegetables that were steaming on the table.

It was a hot July day, and there was no boiling soup to make one perspire with its heat or disgust with its greasiness. Our plates were supplied with the most delicious peas, whose excellence was attributable as well to the butter and cream used in cooking as to the fact that in California peas are nearly always of superior quality. New potatoes, steamed until each was like a ball of snow, with tiny flecks of finely chopped parsley sprinkled over them, were there. Corn cut from the cob and stewed with cream, surely was never so good before. A dish of crimson tomatoes, sliced and mixed with the pale green of sliced cucumbers, had its beauty enhanced by globules of mayonnaise, like amber beads strewed over its surface. There were plates of delicate home-made white bread, Boston brown bread in thin half-moon slices and triangular cuts of crust from a French loaf, with plenty of sweet butter.

Our dessert was composed of great dewy blackberries luscious in their coolness, and served in rose-colored glass dishes; raspberries fresh from their own garden, in dishes of palest sea-green, and over all thick rich cream, real cream and lots of it. We had beside triangular cuts of delightful cocoanut cake, over which one of our party poured cream, thus "out-Heroding Herod," and quite vanquishing our vegetarian friends on their own grounds by showing them this novel use of cream. There was tea of exquisite flavor, and pale amber in color served in dainty bisque cups of shell pink, although this I more than suspected was a concession on the part of our hostess to her Philistine guests. (I mean the tea, not the cups.)

I have had many a dinner of a dozen or more courses, but I never remember to have felt so delicately satisfied as I did after this banquet. I would advise all young wives who are about to begin housekeeping and husband-training to see if they cannot glean a useful hint from this dinner. The drudgery of housework is very much lessened if one has no greasy pots and pans to wash, to say nothing of the saving to one's temper if meats that *will* be either over or underdone, are omitted from the bill-of-fare. I suppose, since it will be hard to find a vegetarian landlady, that I shall in course of time, and after a certain amount of starvation, again eat "boiled mutton," but I shall always think with the servant who in reply to his complaint of its frequency on the kitchen table, was told that it was, "substantial" answered, "Substantial: yes, sir; it is substantial, but a little coarse.

PALMETTO.

KITCHEN TALKS.

ANNIE L. JACK.

"Our remedies oft in *ou selves* do lie
Which we ascribe to Heaven, the fated sky
Gives us free scope; only doth backward pull
Our slow de-ligns, when we ourselves are dull."

So read the Novice to us the other evening as we sat beside the fire, for the night was chilly even in August, and the bright light and warmth were quite cheerful. The Amateur Cook had been making doughnuts, and volunteered to pass them around as we discussed the situation. "Yes, there's plenty of scope," said the Sportsman "and no game here." The Plowman grumbled in an undertone because the fields were limited—nothing but boundless prairie would suit him. "The earth is what we make it," said the Poet, and the Critic scornfully observed, as he brushed a fly from his nose, "Who is responsible for this pest?" "Your neighbor's back-yard "said the Student; and he gave us quite an essay on the value of this scavenger of neglected localities.

It is quite refreshing when the thermometer is not too high, to sit and listen to the wisdom of the newly fledged scholar. It refreshes one's memory and recalls half-forgotten bits of knowledge. So we let them talk—while in the meantime "cook" passed doughnuts and attended to the practical part of life. And while the Novice read on I thought only of the first line. Do our remedies lie in ourselves? It is a hard question to answer and reminded me of a neighbor in whose family diphtheria had been prevalent in Spring. "What do you think," I said, "is the cause of all your children taking the disease? They were not exposed to the infection—the house is on a dry hill, your cellar is dry, and your vegetables are stored under the barn," I was about to suggest the drinking water when she leaned back in her chair and remarked resignedly, "Oh! I suppose it *had to be*, and what is to be, will be." Such people are dangerous to the health of others, for they will not take the trouble to search out causes, or guard against evils, imbued as they are with the theory of predestination.

But while I moralized, the fire burned low, and my attention was arrested by a yarn I heard the "Gourmand" telling of eating, one night, 42 doughnuts. Let us hope they were small ones, for he says he sang a song afterward and was praised as having done so well that he never would believe again that they induced indigestion. But what is one man's meat is another's poison, and what a youth can digest, accustomed to out-door life, to Canadian winter sports, and work, is different from what it would be possible for a delicate youth leading a sedentary life to assimilate, and the stomach is a severely tried friend, capable of enduring a good deal; but subject also to rebellion after oppression. And it is a good motto in feeding as in every other circumstance in life, to be contented with small things, and not be too grasping after a surfeit. A stomach fed with a small quantity of nutritious food is like a little farm well tilled, a source of the most satisfaction.

Mr. E. P. Roe, in Harper's of August, says that for currant jelly the fruit should be picked before it is fully ripe and before it has been drenched by a heavy rain, and that it is the over-ripe, water-soaked currants that break up families and demolish household gods.

He also finds blackberries improved if picked in the evening and kept in a cool place for breakfast.

A WORD TO MOTHERS.

"It sounds materialistic to put sound health before all other virtues, but, really every thing else depends upon it." This quotation from a recent article in the Rural gives me a text for a short sermon to mothers in the farm-houses. I am most interested in you though it may apply to other mothers as well. I wonder how many of you think of your responsibility regarding the health of your children *before* their birth as well as after. How many think whether or not they are expending their vitality, that should go to the embryo infant, in over-work and over-worry? How many of you having weak or ailing children, either small or grown up, know that they are the result in great part of your effort to "get your work done up." Now, I'm not "a paper farmer's wife," but know all about harvest-time, with its crowd of hungry workers; all about house-cleaning, soap-making, butchering, canning fruit, butter-making, etc., etc., and that with even good "help" which is scarce, it seems almost impossible for the "house-mother" to take much care of herself. But is there in the world any work to compare with the value of a human soul? A dwarfed soul may not exist in a dwarfed body, but if, as my text says everything depends on health—its a sound text too—ought not you, having evoked a human life into being, make it your first duty to give it as fair a start as possible? Mrs. Fisher's directions for housekeeping would fit in well right here, but as you have all read them, I will not repeat.

Some people may not think this a proper subject for general reading and that it should be confined to medical works, but the people who have most need of this advice would never see it there. Moreover, the Rural gives advice as to the production of the best grades of horses and cattle, pigs and poultry, and are not human animals of equal importance? If we could regulate the breeding of human beings as we do that of domestic animals, the results would doubtless be even more remarkable.

A VICTIM.

DOMESTIC RECIPES.

AN ITALIAN DESSERT.

The following dish is called Zabajone (pronounced Zab-i-o-ne), and is most delicious, although more suitable for a winter than a summer dessert. Allow two yelks of eggs for each person, one tablespoonful of sugar, and one wine-glass of white wine, preferably Catawba. Put the unbeaten yelks, wine and sugar over the fire in a porcelain vessel, and stir continually without allowing it to boil. As soon as it becomes of the consistency of cream it is done. Serve while hot in cups or glasses with lady-fingers.

FARINA JELLY.

This is not altogether a delicacy for invalids, but also a very good family dessert. Boil three pints of milk, and while boiling stir in slowly four large tablespoonfuls of farina. It should be cooked in a double boiler, and should boil slowly for three-quarters of an hour. When done pour it into a jelly mold and place it in cold water or on the ice to stiffen. Serve with cream, or with the following sauce: Beat up well two eggs with four tablespoonfuls of sugar, add one quart of milk, a teaspoonful of vanilla or bitter almond, and one of brandy.

POTATO SALAD.

Potato salad if properly made is an appetizing dish. The potatoes must be boiled in their skins and peeled and sliced before they get cold. Put a quart of these slices in a salad bowl with four tablespoonfuls of good vinegar and six of table oil, one of chopped parsley and salt and pepper to taste. Stir together until thoroughly mixed, and set aside for two hours.

SUCCOTASH.

I have eaten so many vile compounds under the above name, that I cannot consider it unnecessary to give directions for making it properly. String, and cut in small dice enough delicate snap beans to fill a pint bowl, and cut from the cob twice as much corn. If possible have a cupful each of shelled lima and string beans. Parboil the green beans, and shelled lima and bush beans in a little salted water, cover again with boiling water, add the cobs from which the corn was cut, and boil until the beans are almost done—at least three-quarters of an hour. A quarter of a pound of salt pork added during this process improves it. Take out the cobs, add the corn, cook twenty minutes longer, add one gill of cream, a generous lump of butter, and salt and pepper and you have the best preparation of vegetables known to the modern science of cookery.

Chicago. MRS. C. R. H.

DELICIOUS CAKE.

At one of the lessons given by Miss Parloa in Boston, the following cake was made. A generous cupful of butter was beaten to a cream, two of sugar added gradually, the juice of a lemon, the yelks of five eggs, and the whites of three, a small cup of milk, and three cups of pastry flour through which was sifted two teaspoonfuls of baking powder. The whole mixture was stirred rapidly and thoroughly, and baked in two sheets in a moderate oven for twenty-five minutes. It was then cut into small squares, a portion of the crust removed from each, and the cavity filled with preserved strawberries. This was not done until the cake was cold. The crust was replaced and covered with an icing made as above. This is called Viennois cake.

Fairy gingerbread will be appreciated by the little ones. Beat until light a cup of butter and two of sugar, stir in one tablespoonful of ginger and one cup of milk, in which has been dissolved three-fourths of a teaspoonful of soda. Stir in four small cups of sifted flour, turn the baking pans upside down, wipe very clean, butter lavishly and spread the mixture upon them very thinly. Bake in a moderate oven until brown, and while still hot, cut into squares with a case knife and slip off the pan. The two important points to remember are that the batter must be spread very thin, and cut the instant it is taken from the oven. It should be kept in a tin box. A large dish can be made with the quantities given above.

It is quite possible to make very delightful cream cakes in the precincts of one's own kitchen, as I know from experience. The friend who gave me this recipe superintended the first operation, and the result was very satisfactory indeed. Boil together one pint of water with half-a-pound of butter; as soon as it reaches the boiling point, stir in three-quarters of a pound of flour; let it cook a moment, and when cool add ten eggs well beaten, and a scant teaspoonful of saleratus and one of salt, dissolved in a very little boiling water. Drop with a spoon on buttered tins a little distance apart. Bake in a quick oven; they will puff in baking. When done and cold, cut one side large enough to insert the cream with a spoon. This will make 60 cakes. The cream is made by beating two cups of sugar with four eggs; add a cup of flour and as much of a quart of milk as is required to make a smooth and thin paste; heat the remainder of the milk to boiling, and pour the above mixture into it; stir constantly until it is sufficiently thickened; flavor with vanilla. Do not use it until it is cold. It should be made in a custard or farina kettle.

MRS. A. G.

Worth Knowing.

THAT, as a household remedy, for children and adults, Ayer's Pills are invaluable.

THAT, in Colds, with headache, backache, coated tongue, symptoms of fever, and a constant feeling of weariness, Ayer's Pills will often effect a cure when other remedies fail.

THAT these Pills are sugar coated, perfectly safe to take, do not gripe, and contain neither calomel nor any other dangerous drug.

I have used Ayer's Cathartic Pills in my family for the past thirty-five years. For stomach or liver troubles, or any irregularity of the bowels, and in case of Colds, Ayer's Pills are unequaled. I am never without them.—Frank Tisdale, Montpelier, Vt.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Dealers in Medicine.

MAKE HENS LAY

Sheridan's Condition Powder is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

DO YOU WANT A DOG?

News of the Week.

HOME NEWS.

SATURDAY, August 21, 1886.

THE fund for Mrs. Hancock now amounts to $46,396.....The Canadian Pacific Railroad is cousidering the question whether it can carry wheat and flour into British Columbia to compete with American flour and wheat, which is sent up from Oregon.....The White Earth Indians in Minnesota, have signed a treaty, to be binding only when signed by those on the other reservations. It provides for the removal of the Red Lake, Leeeh Lake, White Oak Points, Boisford, Winnibagoshash, Rat Portage, Mille Lacs, and Gull Lake tribes to White Earth Reservation, heads of families to have 160 acres, minors aged eighteen 80 acres, and children 40 acres, with buildings, oxen, and rations for two years: at the end of fifty years the land to be deeded in fee simple. The other reservations are to be surveyed and sold by sealed proposals in forty-acre lots, the money to be held by the United States at five per cent. as a fund for the benefit of all. Only the Red Lake and Leech Lake Indians are expected to demur to this, their reservations being more valuable than the rest.....The Nebraska State Prohibition Convention met at Lincoln, Thursday, with over 400 delegates, representing 45 counties. After the adoption of a platform which touches every phase of the liquor question, besides setting forth the views of the party on labor, pensions, Sunday observance, and other questions, full State and Congressional tickets were nominated..... New York labor organizations are to hold a convention at Syracuse, September 14, to force the Legislature to abolish the laws against boycotting, and give due attention to suggestions made by workingmen's associations..... Geronimo is reported to be at Frontierez, Mexico, trying to make peace with the Mexicans, for the professed purpose of having a retreat to which he and his followers could bring their plunder after having made raids into New Mexico and Arizona. The old reprobate had his right arm in a sling and was accompanied by 40 bucks and two squaws. Gen. Miles has hurried forward two troops of cavalry to demand the unconditional surrender of the outfit. Lieut. Lockett with the Pima Indians will occupy such positions in the mountains as to prevent escape. The Mexicans will co-operate, and as the "hostiles" "looked worn and hungry," they may be captured or surrender. The Arizonians are warmly endorsing Miles's plan for the removal of all the Chiricahua Indians from Arizona as the only means of securing lasting peace from these wild, fierce and indefatigable braves. The National Assoeiation of Ex-Prisoners of War at Buffalo, appointed a eommittee to investigate the present pension laws with a view to their amendment in the interests of all disabled ex-Union soldiers and sailors, said committee to confer with a similar committee of the Grand Army of the Republic. Chicago was designated as the next place of meeting.

....A shipment of cotton by rail from Memphis to New Orleans, and thence by water to Liverpool, was made recently on through bill of lading at 26¾d., or 53½ cents a hundred. The rail rate from St. Louis to Boston is 54 cents, and this slight discrepancy promises to create a disturbance in the local cotton and transportation circles.....In Havana Cuba, 68 cigar factories working Partido tobacco have been closed, 6,000 workmen having struck for higher wages. The strike threatens to extend to the Vuelta Abajo factories. The manufacturers have united to resist the demands of the workmen..... .....Cardinal Gibbons, of Baltimore, denies that Cardinal Taschereau, of Quebec, in his late declaration of the Pope's sentiment towards the Knights of Labor represents the real attitude of the Catholic Church towards that organization. The Canadian Cardinal's hostility he considers due to some local law or conduct of the Knights; but his Church favors the Knights and all other organizations of labor which have no laws opposed to the doctrine or discipline of the Church.....The President and wife are in the Adirondacks and have very fair fishing. .....The 140th call for the redemption of bonds was issued Thursday. It is for $10,000,000 of the 3 per cent loan of 1882.... . It is claimed that the Iowa Prohibitory law is in conflict with the Fourteenth Amendment to the Constitution of the United States..... Five persons were killed by a boiler explosion at Oshkosh, Wis., Monday..... Sunday night's storm originated in Kansas and Nebraska. At midnight it was central in Iowa, and at 6 A. M. Monday it was central over Lake Michigan. Thence it swept eastward over Northern Indiana and Ohio. Much damage was done all along its course, except in the burning woods of Wiconsin and Michigan, where it extinguished the fires..... Of the eight Anarchists on trial at Chicago the jury yesterday found August Spies, Michael Schwab, Samuel Fielden, Albert R. Parsons, Adolph Fischer, George Engel and Louis Lingg guilty of murder, and fixed the penalty at death. Oscar W. Neebe was found guilty as an accessory, as charged, and the penalty was fixed at imprisonment for 15 years. Parsons is the only American among them. There will no doubt be one appeal at least, probably several. Money for expenses has been liberally contributed by Anarchists here and in Europe. It may take over a year—yes, even two—before a final decision is reached. The Anarchists of this city met last night and made martyrs of the Chicago murderers. They also resolved to overthrow the present "society of robbers," and urged the resistance of force by force. They will, however, shoot off their mouths much oftener than their pistols.... ....Dispatches from Galveston, Texas, reported that a violent easterly gale prevailed there yesterday. The city was partially inundated, and serious apprehensions were felt for the safety of the shipping anchored in the outer roads. Six people were drowned, houses floated about the streets in the lower part of the town near the Gulf, and the street railroad along the beach was torn up. Heavy losses..... ....The Mexican trouble is quieting down somewhat. Secretary Bayard has sent Mr. Sedgwick, a lawyer of this city, to investigate the state of affairs at Paso del Norte; perhaps it would have been better if he had done this before making a peremptory demand on Mexico for the unconditional surrender of the editor. The general opinion is that hitherto Mexico has had the best of the argument Little or no danger of war. Even fire-eating southern volunteers are becoming less belicose. .....The Canadians are still "persecuting" New England fishermen. Occasionally one of these is caught knowingly breaking the Dominion regulations, but most of them do so with the utmost impunity. It is the detected sinner that howls, the others sin on in silence. .....A great meeting of the Irish National League of America has been held at Chicago. Representatives of the Irish in Ireland and elsewhere were present. All went on harmoniously. Parnell's conservative course was heartily indorsed and he will continue to receive the earnest support of "Irish-Americans" and all sympathizers with the cause he so ably advocates. The dynamiters had to take a back seat. Still there were all along subdued indications that policy alone checked violent utterances and threats against the opponents of Home Rule. There were also abundant signs that many of the delegates would be satisfied with nothing short of the complete independence of Ireland..... .....Ex-Postmaster General James is said to have cast in his lot with the Prohibitionists, who talk about nominating him for Mayor of New York..... The Civil Service Commission are considering the project of extending the rules to post-offices that employ less than 50 men, the present minimum limit under cover of the service. Many offices employ 49, 37 and 40 men, and the scheme is to extend this minimum limit from 50 down, say to 25. The Hartford (Ct.) and Columbus (O.) offices have been found to be now within the limits of the law, and will soon be brought under the Civil Service rules. Clerks, letter-carriers, messengers and special delivery boys all are counted as employés in making up this Civil Service limit.....Keiley, the Minister rejected by Italy and Austria, will go to Cairo, as Judge of the International Court of the Khedive.....Measures for relieving the sufferers from forest fires in Northern Wisconsin have been taken. Houses will be built for them and clothing and food supplied sufficient to last them through the Winter. The loss of farm property is very heavy; that of timber up among the millions.....

FOREIGN NEWS.

SATURDAY, August 21, 1886.

LITTLE foreign news of general interest this week—fortunately as there's little room left for news here. Parliament has re-assembled, as it had adjourned to August 19, not September 19, as misstated by some of our dailies. The session is likely to be short, as it will end as soon as supplies to run the Government are obtained The Conservatives insist that late elections settled the impossibility of Home Rule for all time; their opponents deny this. Coercion is not probable. A Local-Self-Government Bill for the three kingdoms is promised—Home Rule probably under a new name; but not so wide as Gladstone's. Belfast riots over for the present. Local authorities greatly blamed, especially the Mayor. An investigation is to be made into the cause of the chronic turbulence of the town. A Royal Commission is also to investigate the Irish land system, and to obtain information as to the best way to develop Irish industries. As Gladstone says, "the Irish Question is the question of the day", and bars all general legislation for the rest of the Empire..... .....England congratulates America, and especially Chicago, on the conviction of the Anarchists. Englishmen are angry at the resolution of the Chicago Irish Convention to boycott English manufactures. It is suggested that the delegates from Canada and other British subjects should be prosecuted for treason on their return home. Negotiations for a friendly settlement of the fishery question are proceeding between England, the United States and Canada. ..... Burmah, which the British rapidly conquered some months ago, is still giving a good deal of trouble, owing to the boldness and persistence of the Dacoits, robber bands, who overrun the country outside of the British lines. The forces there are to be increased by 5,000 troops as soon as the cold season comes on. Major-General Herbert MacPherson is to be given supreme command. Ten thousand policemen will also be sent from India to maintain order, after the troops have subdued the insurgents.. The tenants of the London Salters Company's estates at Magherafelt, Londonderry, have purchased their holdings under the terms of Lord Ashbourne's Land Purchase Act. The price is £220,000, or nineteen and a half years' purchase at the net annual valuation, which is 20 to 25 per cent. below the present rents. ....The Duke of Leinster has arranged to sell to his tenants a large portion of his Kildare estates on an eighteen years' purchase plan .. ..In Italy the cholera is increasing. There is a rumor afloat in Rome that Queen Margharita is using her influence to bring about a reconciliation between the Italian government and the Papacy. Under the arrangement contemplated the Pope will, it is said, receive from Italy arrears of endowment to a large amount, which will be devoted to extending Catholic missions.....The French government after having confiscated millions of dollars' worth of Church property, exiled the Jesuits, lowered the salaries of the clergy, secularized education and in innumerable other ways despoiled and insulted the Catholic Church, is now angrily indignant because the Pope has sent a Nuncio to China to represent the Catholics in that Empire. Hitherto all, of whatever nationality, were under the "protection" of France, which greatly increased French prestige in the country, and in the East generally. The Chinese wish the change and all other countries approve it except France..... ..... A number of presidents and ex-presidents of the Central American republics of Salvador, Nicaragua, Honduras, Costa Rica and Guatemala are in the city of Mexico trying to arrange a plan for the union of those States in one confederation, with the ultimate view of annexation to the Mexican Republic.....

AGRICULTURAL NEWS.

SATURDAY, Aug. 21, 1886.

A TELEGRAM from Quebec, Wednesday, says, that all the cattle in Levis quarantine will be at once killed to prevent the spread of contagious pleuro-pneumonia. The herds are owned by Andrew Allen, Dr. Clark and A. Dawes, of Montreal; Senator Cochrane, of Compton, and J. J. Hill, of St. Paul. The cost of the herds foots up $200,000 The entire appropriation made by Congress for our National Bureau of Animal Industry for the entire current year is $150,000. Out of this must be paid all the salaries and legitimate expenses of the staff, and the cost of diseased animals slaughtered by their direction. Canada with its 4,000,000 population pays $50,000 more for one effort at one place to get rid of pleuro-pneumonia among her herds than the United States, with 60,000,000 population, pay for numerous efforts during the whole year to get rid of pleuro-pneumonia, Texas fever, hog cholera and other contagious diseases among the live stock of the entire country. The disease, whatever it may be, is the same on both sides of the St. Lawrence; but the number of animals endangered is a dozen times greater on this side of the boundary line than on the other.. ....Favorable reports are being received from the experimental tobacco crops in South Carolina. Tobacco of good quality is being produced in some parts of the State, and the opinion is entertained that it will pay handsomely A new industry has recently been started at Los Guindos, Chili, in the shape of an establishment for the manufacture of sugar from beet root.....The biggest shipment of lard ever arranged for was contracted for last Tuesday at Chicago by the Plankinton-Cudahy Milwaukee clique which is running the September lard deal. Room was engaged for 50,000 tierces of lard on one contract. This is $1,500,000 worth of property. If it went by rail it would take 800 freight cars. It is a contract by which nearly one-half of all the lard in store at Chicago moves out. It will go east by propellers, and all the propeller lines participate ....Oliver Dalrymple, the bonanza wheat grower of the Northwest, thinks there will be little or no shortage in the Dakota wheat crop, for the decrease from drought will be made good by the increase of acreage.....The United States troops at Fort Washakie Wyoming, have orders to clear out all range cattle from the cultivated parts of the Crow Reservation, about the Big and Little Wind Rivers—an area 25 by 30 miles. The Indians complain that their crops are destroyed by white men's cattle that have no right there..... The census returns of the United Kingdom for 1885 give a total of 29,940,200 domestic fowls in the British Isles, of which about two thirds are hens, etc., and one-sixth are ducks. There were a little over 3,000,000 geese and 1,288,000 turkeys..... .....

Crops & Markets.

SATURDAY, Aug. 21, 1886.

THE latest reports of the fruit crop confirm the forecast of the Rural Crop Special, dated July 10. Although this is generally the "bearing" year for apples, the yield of the trees will hardly be up to the average of bearing years in any part of the country. From 1,500 reports the New England Homestead says that in New England, although there is a large yield of Fall fruit, the reports indicate that the crop of Winter apples will be about 70 per cent of the usual even-year yield in the six States. In the best apple counties of Vermont, along Lake Champlain, not two-thirds of a full even-year crop will be secured, while Maine reports a decrease of 20 per cent, but both these States and New-Hampshire will have a large surplus. Connecticut has but half a crop and Massachusetts only 89 per cent of a crop. The falling off in New-England, however, will be partly made up by the great crop in the apple sections of Nova Scotia. Anapolis and King Counties last year exported only 40,000 barrels, but this section will have a surplus of 100,000 barrels. The great apple counties of Western New York promise the lightest crop in twenty years, but the quality promises to be comparatively poor. The great apple counties of Orleans, Monroe, Niagara, Wayne and Wyoming are reported as having scarcely 50 per cent of the average yield. In Eastern New York there is a better prospect, but the average for the whole State—400 reports—is only 52 per cent. Pennsylvania has 80 per cent of a full apple crop and there is a good crop in Ohio, but from further West the reports are discouraging and the Northwest and Southwest have such a small supply as to offer a remunerative market for the surplus of the Middle States, much of which was last year available for export.

Pears will be considerably below the usual yield and peaches for the third time are practically a failure north of the forty-first parallel. There is a fair crop of plums and they will be cheap, while grapes in New Jersey are light and a good crop in Southern New-England should bring fair prices.

The Michigan peach crop in the vicinity of Ganges, Douglass, Saugatuck, and South Haven is reported to be very heavy. Outside of those localities there is scarcely any fruit, according to the last reports.

The fruit crop of California is very heavy, and large quantities are sent East. Grapes are so abundant that they are sold to the distillers at $8 per ton.

Florida oranges will not begin to come in until toward the end of October. The crop is said to be fine, but the yield will not be more than a moiety of what it was last year, owing to the large number of fruit buds destroyed by last Winter's frost in the orchards north of Lake George.

Cable reports from various points in England and on the Continent confirm the earlier predictions of rather a short apple crop there, especially of good fruit in England. The orange crop of Southern Europe, however, will be large and will affect the demand for American apples somewhat. Last year nearly 900,000 barrels of apples were exported to England, the supply being so large that prices were barely remunerative. American Orange Pippins sold in Liverpool at $3.60 per barrel. This was the first sale of the season and the price was equivalent to about $2.25 net on this side, which is a slight advance on current values.

The average condition of potatoes is worse than in any former August, though it was quite good in July. Usually from early in August to early in October is the critical period with the crop; so that the present poor condition of the crop, while rather discouraging, does not necessarily foreshadow a bad harvest. In New England the condition is good, ranging from 95 to 100. In New York

the average is 96, and it is still higher in the Middle States. It is very nearly a full average in the Southern States, except in Louisiana, where the crop has been damaged by overflows in low areas. The great loss has been suffered in the West, owing to the drought. The injury has been not very heavy in the eastern part of the Ohio Valley; worse in Michigan, and quite severe in Indiana, especially in the western part of it. In the drier sections farther west the damage has been still heavier; but abundant rains of late may restore, at least in part, what has been lost. Sweet potatoes make a good show everywhere except in some of the Western States, where attempts were made to grow them north of the 40th parallel.

THE hay crop last year turned out fairly in in the West, but was generally light throughout the East. From present indications the reverse will be the case this season. The long drought has seriously affected the crop in nearly all the Western States. The gist of numerous late reports goes to show that the crop in Illinois will be from one-half to three-fourths the average yield. It will be equally short in many parts of Ohio, Michigan and Indiana. In the East, however, the weather has been more favorable. Throughout this State the crop, though lighter than it has been in some years, will be quite up to the average. Along the line of the New York Central Railroad it will be fair and of an unusually fine quality—better in fact than it has been in years. This is also true in regard to Jefferson County, one of the great hay sections of this State. In some of the Hudson River counties the crop will be a trifle light, but less weedy than it was last year. Favorable advices have also been received from Montgomery County, where the crop is described as fair. Throughout Long Island and New Jersey the crop is much better than it was last year, and in some parts it is extra heavy. There is also general satisfaction with the yield in the Eastern States, so that it is not likely that the price of hay here will be materially affected by the short crop in the West. One prominent dealer said Wednesday that the price would range from $11 to $17 a ton all the winter. "I don't see how it can go above the latter figure," he added, "on account of the lot of old hay that is still on hand. In one county I know of over 6,000 tons of last year's growth still in the barns. This was kept out of the market by the low price that prevailed last spring." The current prices are: No. 1, Timothy prime, per hundred, 85c.; No. 2, Timothy, good, 70c. to 75c.; No. 3, Timothy, 55c. to 65c.; Clover mixed, 55c. to 60c.; shipping grades, 50c.; inferior, 30c. to 40c.

The Department of Agriculture says hay in New England and New York was generally a large yield and well secured, though cut short in some localities by drought; while in others wet weather interfered with harvesting. In the Southern States from the Atlantic to the Ohio and Mississippi there has been plenty of rain. Considerable damage from floods in low lands; but generally there have been good crops of clover and the various grasses. In Maryland, West Virginia, and Kentucky excellent crops have in many cases been secured in good condition, but a considerable amount was damaged by excess of rain before or after cutting. In Virginia and Tennessee the proportion damaged was much larger. In all these States clover suffered most, and was left to rot in the fields in some localities, particularly in parts of Virginia and Tennessee, where a fine crop of Timothy was saved in good condition. Less complaint of loss in the Gulf States than further north. The Michigan crop was cut "considerably" short by drought and a number of counties in Ohio had scanty crops. Reports from Indiana and Illinois are mostly favorable, especially as regards the securing of the crop. "Some are raising Alsike Clover, it makes excellent hay." The Wisconsin crop is generally light, but saved in good condition. Minnesota hay has "suffered quite severely" from drought, though heavy in "some counties." "Crop generally good" in Iowa, though light in several counties and a failure in a few. Conditions in Missouri much the same as those in Iowa.

In tobacco there is danger of a reduction of one-third in the Atlantic States owing to excessive rains. A failure in Maryland on clays and hillsides. In some parts of North Carolina replanting has been done three or four times. A good average condition of the crop in Tennessee. Much rain, followed by drought checked growth and weakened the plants in Kentucky, causing spindling and premature flowering. Outlook better in Ohio and West Virginia. Cigar leaf looks fairly well in Massachusetts, but not so good in Connecticut; good in New York and Pennsylvania, but suffering from drought in Wisconsin. Abundant rains there within the last few days will help to improve condition.

The acreage of buckwheat is nearly the same as in 1885, with a slight increase in New York, New Hampshire, Maryland, Virginia, West Virginia, and Dakota, and a slight decrease in most of the Western States. Condition high in New York and Pennsylvania; quite good in the Eastern States; but comparatively low in the West.

A telegram from Louisville, Ky., last Monday, says there had been a sharp advance in hams in the past two weeks and a rumor gained circulation on Monday that McFerran, Shallcross & Co. had bought all in that market. The firm admitted that they held nearly all the stock there, and said Armour had all in Chicago and that there were no large lots in St. Louis, Kansas City nor Cincinnati. These cities, especially St. Louis, had been buying heavily in the Louisville market. The firm denied any attempt to "corner" hams, and attributed the scarcity to the cheapness of hams early in the season, causing a heavy consumption, and to the summer packing not yet having gone upon the market.

The official return of exports of breadstuffs from the principal ports, which report in the aggregate about 98 per cent of the entire exports of bread stuffs from the country, is not quite as encouraging for July as it was for June, but shows a decided gain, nevertheless, in comparison with last year. The exports of wheat and flour were equivalent to 10,915,113 bushels of wheat, against 6,287,574 in July of last year, which is a good beginning for the new crop. It may be noticed, also, that while the shipments from the Pacific coast were nearly 60 per cent greater than those of July, 1885, those from the Atlantic coast were about 77 per cent greater. The decline in prices seems to have been rather greater on the Pacific than on the Atlantic coast, for the average export price for July from Atlantic ports was 96.9 cents per bushels last year, and only 86.8 cents this year, but it was 85.9 cents from the Pacific ports last year and only 74.8 cents this year. The movement of corn was smaller than a year ago, and there was a specially large decline in oats and oatmeal. The value of all breadstuffs exported in July was $11,570,649 this year against only $8,721,811 last year.

There is a good deal of talk just now of the range of prices of farm products at present and "before the war." In making a comparison, the period taken should be just as far beyond the war as to preclude any possible influence from anticipations of the "inevitable conflict." Hence we have taken the average of last week's market reports and of those for the corresponding week in 1858:

Breadstuffs—	1858. Prices.	1886. Prices.
Wheat flour, superfine, per bbl	$1 25	$2 80
Rye flour, per bbl	4 00	3 30
Corn meal	3 25	2 75
Wheat, No. 1 spring, per bush	95	85
Rye, Western, per bush	1 10	54
Oats, State, per bush	43	43
Oats, Western, per bush	46	45
Corn, Western mixed, ungraded, per bush	65	51
Cotton, middling uplands, per lb	8¾	9 7-16
Hay, shipping, per 100 lbs	65	50
Hemp, Manila, per lb	7	8¾
Hops, per lb	10	28
Pork, mess, per bbl	15 40	10 62½
Pork, prime, per bbl	13 00	10 00
Beef, prime mess, per lce	10 00	12 00
Hams, pickled, per lb	8½	12
Lard, Western, per lb	9¼	7 3-10
Butter, Western, per lb	16	20½
Butter, prime State, per lb	20	22
Cheese, fine factory, per lb	8	8½
Seeds, clover, per lb	9½	10½
Sugar, refined, hard, per lb	10⅜	6 5-16
Tallow, per lb	10	4 1-16
Wool, Ohio fleece, per lb	27	37½

LATEST BRIEFS.—Wool is quiet and unchanged from last week. Buyers are holding off, and transactions are smaller than one year ago. Light-weight goods, on which prices of raw wool are asserted to depend, are no higher. The speculative wheat market is being influenced chiefly by the increased sales for export, backed by renewed advices of short crops abroad; consequent rise in price everywhere of from 2½c. to 4c. Indian corn is quiet and lower, with an improved crop outlook. Hog products are featureless, except lard, in which there is an effort to corner the product for September, which results in a fictitious advance. The extreme heat has not been favorable to the cotton plant in Louisiana and Alabama. The prospects are not so bright in Texas for a like reason. Sales of tobacco at New York are more active at unchanged prices. The Western tobacco markets are dull, rains having benefited the crop. At San Francisco 2,000 tons of wheat changed hands Thursday afternoon. There has been an advance of 9¼c. a cental during the week.

MARKETS BY TELEGRAPH.

SATURDAY, August 21, 1886.

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 3½c. higher; No. 2 Spring, 3⅜c. higher. Corn, 1⅜c. lower. Oats, ¼c. lower. Rye, ½c. lower. Barley, steady. Flaxseed, 4c. lower. Pork, 25c. higher. Cattle, Shippers, 55c. lower for poor kinds; 5c. higher for best; stockers and feeders 10c. lower; other sorts about the same. Hogs, 10c. lower all around. Sheep, from 50c. to 75c. lower.

WHEAT.—Active; Sales ranged: August, 78@79¼c; Sept., 78⅝@80c; October, 80⅝@82c; No. 2 Spring, 78¼c. CORN.—Cash, 42¾c; August, 42⅜@42¾c; September, 43½@44½c; October, 45@45¾. OATS.—Easy. Sales ranged: Cash, 27½c; August, 27½c; September 27¾@28½c; October, 29¾@29½c. RYE.—Quiet; No. 2, 50½c. BARLEY.—September, 61@62c. FLAXSEED.—No. 1, $1 11½. MESS PORK.—Sales ranged: Cash, $9 42½@9 45; August, $9 15@9 37½; September, $9 47½@9 60; October, $9 57½@9 70. LARD.—Firm; sales ranged: Cash, $7 42½; August, $7 37½@7 45; September, $7 37½@7 45. SHORT RIBS.—Cash, $6 15. BOXED MEATS.—Dry salted shoulders, $5 75@5 87½. Short clear sides, $6 60@6 65. CATTLE.—Shipping steers, $3 90@5 15; stockers and feeders, $2 20@3 50; cows, bulls and mixed $1 50@3 25; bulk, $2 30@2 60; through Texas steers, $3 75@3 85. HOGS.—Rough and mixed, $4 00@4 70; packing and shipping, $4 70@5 15; light weights $3 80@4 80; skips, $2 50@3 80. SHEEP.—Market low; Natives, $2 00@4 00, Texans, $1 75@3 00; Lambs, $3 75@4 75.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is 2¾c. higher. Corn, and Oats, unchanged. Rye, ¼c. higher. Flaxseed, ¼c. lower. Pork, 5c. lower. Cattle, a trifle lower. Hogs, from 5 to 10c. higher.

WHEAT.—Active; No. 2 Red, Cash, 78¾@79¾c; August, 78⅝c; September, 80¾c. CORN.—Quiet; No. 2 mixed Cash, 39¾@40c; August, 40c; September, 40¼c. OATS.—Dull; No. 2 mixed, Cash, 26@27½c.; August, 27c; Sept, 27¼c. RYE, Sept, 52¾c. BARLEY.—No market. BUTTER.—Creamery, 17@22c; dairy, 15@17c. EGGS, 9c. FLAXSEED.—$1 09. HAY.—Timothy, $10 00; Prairie, $7 00. BRAN.—49c. at mill. CORN MEAL.—$2 20. PORK.—$10 30. BULKMEATS.—Long clear, $6 20; short ribs, $6 30; short clear, $6 45. LARD, $6 60. CATTLE.—Good to Choice Native Shipping Steers, $4 30@4 75; Common to Fair, $3 65@4 25; Butchers' Steers, $3 50@4 00; Cows and Heifers, $2 25@3 50; Stockers, and Feeders, $3 25@4 00; grass Texans, $2 25@3 50. HOGS.—Market quiet; heavy, $4 90@5 15; Packing, $4 40@4 85; Lights, $4 30@4 80. SHEEP.—Market steady at $2 25@4 00.

BOSTON.—GRAIN.—Corn.—Steamer mixed at 55½c. per bushel, and the close a firmer tone; high mixed has sold at 57½c, and steamer yellow sold at 56½c OATS.—Steady; No. 2 white at 39½@41½c. as to location; No. 3 white, 39@39½ and fancy clipped at 47@47½c. per bushel. The market for rye is fair at 70c. per bushel. Bran, $14@15 00 for Spring, and $13 75 for Winter; Fine Feed and Middlings at $13@18, and Cotton Seed Meal at $23 50 on the spot, and $21 75 per ton to arrive. HAY AND STRAW.—The demand moderate, with sales of choice Northern and Eastern at $18@18 50 per ton, $15@17 for fair to good, $13@16 for fine, and $9@13 for poor and damaged; Western choice, $16@17, do fair to good $14@15. Straw.—Rye straw is held at $16@16 50 for choice, and $14@15 for common to good. Swale hay at $10@11 per ton. Oat straw at $8@9 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra, 20@21c; extra firsts, 18@19c; firsts, 16@17c; Western creamery, 19½@20c. for extra firsts to extra; firsts, 18@19c; Northern dairy, 14@17½c. for Vermont extra firsts to extra; firsts, 14@14½c; seconds, 12@13c; Western dairy, 12@12c. for firsts; seconds, 9@11c; imitation creamery, 14@15c for extra firsts to extra; ladle-packed, 9@12c, for extra firsts to extra; firsts, 8@9c; seconds 7@8c; grease, 3@4c. NEW CHEESE. New York and Vermont extra, 8½@8½c; do. do. firsts, 7@7¾c; do do. seconds, 4@6c; Western extra, 7¾c; do. firsts, 6½@7¼c. EGGS.—Cape and near-by, per doz. 15½@19c; Eastern extras 17½@18c; do. firsts, 15½@16c; Northern firsts, 15½@15c; Western firsts, 14c; Provincial, 15½@16c. BEANS.—Choice Northern hand-picked pea, $1 75@1 85 per bushel; do. do. New York, small, $1 60@1 70; do. do. screened, $1 15@1 30; medium choice, hand-picked, $1 50@1 55; do. do. screened, $1 15@1 25; Yellow Eyes, improved $1 50; do. choice flats, $1 25@1 40; Red Kidneys, $1 75@2 00; Canada pea, 55@65c. per bushel for common to choice; green peas, Northern, 90c@$1; do. Western, $1 15@1 20. POTATOES range at $2 00@2 25 per barrel.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, August 21, 1886.

STATE OF THE MARKET.—As compared with cash prices last week, flour is 5c. higher; ungraded red wheat is 4c. higher; No. 3 Red 3c. higher; No. 2 Red, 4c. higher, corn, ungraded mixed, ½c. higher; No. 2, ¾c. higher. Oats, steady. Pork, 12½c. lower. Butter and cheese, 1c. to 1½c. higher. Eggs, ½c. to 1c. higher. Poultry, steady,; Fruits and vegetables steady.

FLOUR, FEED AND MEAL—FLOUR—Quotations: Fine, $2 00@2 65; Superfine, $2 15@2 90; Extra No. 2, $2 65@3 15; Good to Fancy Extra State, $3 20@3 70; Common to Good Extra Western, $2 65@3 70; Good to Choice Extra Western, $3 90@4 70; Common to Fair Extra Ohio, $2 65@3 75; Good, $3 80@4 20; Good to Choice, $4 25@4 75; Common Extra Minnesota, $2 65@3 00; Clear, $3 25@3 75; Rye Mixture, $3 30@3 75; Straight, $4 00@4 60; Patent $4 40@5 10; Bakers' Extra, $3 75@4 50; St. Louis Common to Fair Extra, $2 80@3 65 Fair to Good, $3 70@4 50; Good to Very Choice, $4 55@4 90; Patent Winter Wheat Extra, $4 25@5 00, City Mill Extra for West Indies, $4 40@4 55; South America, $4 30@4 60. SOUTHERN FLOUR.—Common to Fair Extra at $2 80@3 60, and Fair to Choice, $3 65@5 00; Patent, $5 25. RYE FLOUR.—Superfine, $3 20@3 40, latter for fancy. CORN MEAL.—Yellow Western, at $2 50@2 75; and Brandywine at $2 80@2 95. FEED.—40 to 50 lb, quoted at 70@75c; 60 lb at 65@70c; 80 lb at 75@80c; 100 lb at 80@90c; Sharps at 95c@$1. Rye, at 75@80c.

GRAIN.—WHEAT.—Ungraded Red, 81@83½c; No. 3 Red, 81½c; Steamer No. 2 Red, 85¼c; No. 2 Red, 89½@89¾c; Ungraded White, 88c; No. 2 Red, for August, 88¾@89¾c; do. for September, 89¼@90¾c; do. for October, 90¾@91¾c; do. for November, 92¼@93½c; do. for December, 93¾@94¾c; do. for January, 95@95¾c; do. for February, 96½@97¼c; do. for May, $1@1 01¼; do. for June, $1 02¾. CORN.—Ungraded Mixed, at 51¾@53c; No. 2 53¾@53½c; ungraded white, 55½c; No. 2 for August, 52c; do. for September, 51¾@52½c; do. for October, 52¾@53c; do. for November, 53¾@53½c. OATS.—No. 3, at 32c; do. White, 36½@38¾c; No. 2, 38@38¼c; do. White 37@37½c; Mixed Western, 33@34c; White, do. 36@38c; White State, 41c. No. 2 for August, 33@33¼c; do for September, 33¼@33½c; do. for October, 31¼c; do. for November, 33c.

PROVISIONS.—PORK.—Mess, quoted at $10 50 for Old and $11 00@11 50 for New; $12 00@$13 00 for Family Mess; $13 25@14 75 for Clear Back, and $9 50@10 for Extra Prime. BEEF.—Extra India Mess, $11 50@13; Extra Mess, in barrels, $8 00; Packet, $8 50; Plate, $8 50. BEEF HAMS.—Quoted at $24@24 50 for new. CUT MEATS.—Pickled Bellies, 12 lb average 6½c; Pickled Bellies, 12 lb average, 6½c; City Pickled Shoulders, 6¼@6½c; Smoked Shoulders, 7½c, Pickled Hams, 11½@11¾c; Smoked Hams, 12½@12¾c. MIDDLES.—Long Clear in New York, 6¾c; at the West, Long Clear, 6.40c; Short Clear, 6.60c. DRESSED HOGS.—City Heavy to Light at 6¾@6¾c, Pigs, 6¾c. LARD.—Western steam spot, at 7.12½@7.15c; September, 7.45@7.50c; October, 7.15@7.19c; November, 6.85@6.88c, December, 6.85@6.90c; City steam stronger; refined, 7.00; continent, 7.75c.

BUTTER.—Creamery—State, pails, fine, 23; do. and Pennsylvania, tubs, 22½@23c; Western, best, 22@22½c; do. prime, 18@19½c; do good, 15@16. State Dairy, half-firkin tubs, best, 21@21½c; do. do. about prime, 19@20c; do. do. good, 17@18c; do. common, 13@14c; Welsh tubs, best, 20c; do. prime, 18@19c, Western Imitation Creamery, best, 15c; do, fair and good, 13@14c; Dairy, fine, 13½@14c; do, common, 11@12c; do, Factory, fresh, 12½@13½c; do. good, 11@12c.

CHEESE.—The quotations are for: New State Factory, best white, 8¾c; do. best colored, 8¾c; do. fine, 8½@8¾c, do, fair, 7¾@8c; do. common, 7@7½c, Ohio Factory, fine, final, 7¼@7½; State Factory, light skims, 6@7c.

EGGS.—State, 15c; Western, 14@14½c; Canadian, 14¼.

HOGS.—Receipts for six days, 28,241 head against 30,458 head for the same time last week. State Hogs 235 lb, at 5 1-10c; do, 260 lb, at 5c.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

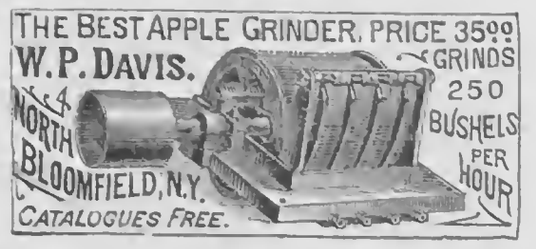
Pulverize Wheat Ground. WALDO F. BROWN, of Butler County, Ohio., in describing several experiments with reference to thorough pulverization of the soil for wheat says: "The result of the experiment (thorough pulverization) and observation was that $1.00 of extra work per acre with good Pulverizers adds from 5 to 10 bushels per acre."

See advertisement of the "ACME" Pulverizing Harrow, Clod Crusher and Leveler on page 572.



For the Young.

IT is the "trusty" boy who gets along in the world. A great many men tell me they never get any vacation, and never like to go away from their business because they have no one to leave behind that they can fully trust. If they had some one to leave behind who could do things just as they should be done, there would be a different feeling about going away. These "trusty" boys make "trusty" men, and such men always are wanted. The fact is that people who hire men want no other kind, and take men whom they cannot fully trust just as they would buy cheap goods.

The days are beginning to grow a little shorter. Before we know it Winter will be upon us. Time goes pretty fast to those who are busy, and there is nothing harder to bear than the thought that time hangs heavy on our hands. It pays to keep busy, to have some good work to do. I don't believe in people who do nothing but work. They don't accomplish nearly as much as they would if they would take a little time for play. I don't think much of people who want to play all the time. They hurt themselves, and really don't have the good time that they would if they would only learn how to work. It is pretty hard for some people to believe this. I can remember the time when I didn't, but it is true as anything can be.

I always like to see cattle that are trained to lead. They are more gentle and are easier to handle. It is a very good plan to put a halter on the calves and teach them to lead and stand. It can't be done too early. They will never forget the lesson. I once saw a wild cow just taken off the range fastened in a row of stanchions. She was terribly frightened. She jumped and pushed and broke down the stanchions and ran off with a wooden frame about her neck. A negro at the South had been made a present of a little dog. It was a little yellow dog of no good whatever, and yet the negro thought it was a wonderful animal. He bought a piece of rope about 25 feet long and an inch through and tied one end about the little dog's neck and the other to the saddle of his mule. Then he got on the mule's back and started for home. The poor little dog tried to keep up, but that great rope tripped him, and before he knew it he was on his back with the rope dragging him along. He learned how to lead, but he was a dead dog before the negro could untie the rope. Don't try to lead calves that way. Be gentle with them and treat them kindly.

THE STORY OF A DISTRICT SCHOOL

A COLLEGE BOY'S DIARY.

(Continued.)

Mr. Forest gave his opinion at length. I listened attentively—the long sentences gave me fresh courage.

"I have repeatedly informed this gentleman that what we most need is direct and thorough instruction in the primary principles of elocution, penmanship and correct deportment. The study of mathematics and of correct orthography is, I admit, of vast importance, yet you will readily concur with me gentlemen in saying that our young men and women are, as a rule, most horrible readers, and that the short sentences which we occasionally find written upon the board at our reform club meetings are of such construction and mechanical execution that no living person can ever read them."

This speech had the effect which was doubtless intended. The other members of the board edged their chairs away from the speaker and looked wonderingly at each other. Mr. Monser started to reply and put in another good word for spelling, but after careful deliberation he appeared to think that silence was safest. He appeared resigned to his fate. He waved his hand sadly and muttered with a sigh—"there goes another term o' school for nothin'."

Mr. Forest, encouraged by his success, now started at another point in the enemies' line.

"I would gladly call your attention to another point, well worthy of your attention, gentlemen. It has been the custom in this district for the teacher to board around. Now, I am prepared to prove by the most careful calculation"—

"I'll vote agin that every time," Mr. Hardhack fairly shouted, even before the question had been stated, "Teacher'll hev ter board 'round an' they ain't no use fitin' it. We all wanter see what teacher's made of. Like enough we kin give him pints agin them what wants fer ter sorter dog him on."

"I'll vote agin it too," broke in Mr. Mouser, "teacher's got ter board 'round; thar' ain't no dodgin' it."

Thus this point was settled. All Mr. Forest's eloquence only made the majority of the board more of a unit. It was decided that I should board around. The school board shortly adjourned, and the director and I were left alone to talk matters over.

"You'll find your hands full now. They've gone home angry at me, and they will be sure to take it out of you. They will tell all the big boys to be sure and come to school and make trouble. I'll stand right back of you. They have been needing this for a good many years. Now I want you to give them a good strapping."

"But I am no prize-fighter; I want to teach school."

"I know you do. You never taught a district school before, and you have an idea that things are going off just as they do at college, where the boys are all anxious to learn. If you go in with that idea I tell you plainly that you'll be the most surprised man in the world at the end of the first fortnight. You can make up your mind at the start that you will have a fight before the term is over. Start now with that idea and you'll be better prepared for it when it does come. I don't care how often you thrash those hounds. Just keep order over there and I'll pay all the bills."

"Well, what shall I do in case we have trouble?"

"Mop up the floor with them. Pull them straight. That's all I can say. Nobody can fight your battles for you, though I'll do all I can to help you. Let's start out with these facts. The boys here will expect a fight with the teacher. It is a regular part of the programme. You will have to make the fight yourself. If you give up you might just as well let the school go. I will back you up in whatever you do, and will give you $10 extra if you will thrash the bully of the district so he can't see."

"Who is the bully?"

"A fellow named Jack Brawn. A great strapping fellow who just makes it a business to whip every teacher. He's smart enough too, if he'd only start right. His father eggs him on. You'll have to fight him anyway. But come now, let's drop the school and have some music."

Mrs. Forest came in and took her place at the piano. This was the only musical instrument, as I afterwards found, in the district. With the help of the hired man and the director's little daughter we were able to make music that made up in volume what it lacked in quality.

I lay awake for a long time that night. I must admit that I seriously considered the question of giving up the school and backing out of the impending conflict. The various reports to which I had listened were doubtless exaggerated, yet it was evidently a most unpleasant neighborhood. There were two things that made it almost impossible for me to give the school up. I felt that I must earn the money. Without it my college course must be interrupted. But most of all I hated to give up anything that I had once attempted. So I fell asleep at last with my mind fully made up to stay in Bear Creek and fight it out. I can remember that I dreamed all night of fighting Jack Brawn for the possession of the school building. I do not remember which won in this battle, but I had such a fine opportunity of fighting the bully that I should have been well acquainted with his methods of attack and defense.

LETTERS FROM THE COUSINS.

UNCLE MARK: I am very much interested in your department and about a year ago you asked for a vote on a number of questions, and I do not remember of seeing the result of the vote. When are we to have the result? I am anxious to know how we stood on the questions. Yours, G. A. BLISS.

Groton City, N. Y.

[That makes me think that I have never told you how the vote did come out. I am very sorry about it for I had it all arranged at the time, but the advertisements crowded us into such a little hole that I had to give up many things. You will all remember what we voted for—1. The most serviceable animal to the farmer. 2. The most valuable grain. 3. The best pet. 4. The most valuable fruit. 5. The most beautiful flower. 6. The most valuable vegetable. The voting went on for a long time, and many votes were cast. It was decided at last in this way: 1. Cow first, horse second. 2. Corn first, wheat second. 3. Dog first, baby second. 4. Apple first, strawberry second. 5. Rose first, violet second. 6. Potato first, carrot second. The contest between the cow and the horse were pretty close—there were but three votes between. All the others had good majorities. I thought at first that wheat would beat corn, but a good many corn votes came in with a rush and carried the day. —U. M.]

DEAR UNCLE MARK: I am a little girl, 13 years old, and I have two sisters and four brothers. My father has a farm of 140 acres. We have six cows, four horses, seven pigs, 25 chickens and three cats. I planted the Rural seeds, but few came up. But one flower came up of the Garden Treasures and I do not know the name of it. My father takes the RURAL and I love reading the letters from the Cousins very much. I never wrote a letter to the RURAL before and don't know if this will be a good one or not. I wonder if you could tell me what will kill the insects on the cabbages and keep the woodchuck away from them. Your niece,

GERTRUDE GARTHE.

Leelanaw Co., Michigan.

[For the cabbage worm Buhach is sure death. For the fly use dust or plaster or ashes sprinkled over the leaves. Kill the woodchuck. —U. M.]

DEAR UNCLE MARK: I have written once before but it is quite a while ago. I planted the Garden Treasures, they are very nice. I wish the Cousins could see my pansies. I have some beautiful ones. I water my flowers every night. We had a wind storm last Thursday and it blew a board through our window. We have 100 head of cattle and 19 head of horses and five little colts. I have three pet lambs. I have raked about 140 acres of hay this year; I had a riding rake.

Your niece, ETHEL MOON.

[Well done. You are quite a haymaker. That board was a visitor that did not receive any welcome.—U. M.]

DEAR UNCLE MARK: I am a little girl, nine years old, and I would like to be one of your Cousins. Papa takes the RURAL NEW-YORKER. We live on a farm of 128 acres. We raise a great many chickens. We have four head of horses. We have seven milch cows and seven young cattle. My sister has a canary bird and one dove. We live near the Delaware River. We have a large peach orchard of about 1,000 trees, and two apple orchards. We have 24 little ducks and 33 turkeys. We have two gardens—one early and the other late. We have all kinds of vegetables in them. We live on a hill and have a very nice view. Your niece,

Northampton Co., Pa. MINNIE JACOBY.

DEAR UNCLE MARK: I am a girl, 14 years old. My father has been taking the RURAL for over 10 years, and thinks it is the best farmers' paper he has ever read. I enjoy reading the letters from the Cousins. I have just been reading the piece about the habit of drinking tea and coffee to my mother, from the RURAL. She thinks it is a bad habit, and drinks neither of them. I have a sister older than myself, a father and mother. I have five fan-tailed pigeons, which are very tame. We have a pet dog and a year old heifer.

Your niece, ELMIRA R. BRAGAW.

Newton, L. I.

[Glad people think as I do about tea and coffee. It is only a habit any way.—U. M.]

DEAR UNCLE MARK: I want to tell you of my Garden Treasures, which I think are just splendid. Mamma and I care for them together. We can have as large a flower bed as we want. I will tell you of the plants that came up. Bachelor's button, balsam, calliopsis, candy tuft, carnation pink, catch fly, coxcomb, convolvulus, cypress vine, California poppy, dahlia, dianthus, two varieties of foliage, hyacinth bean, lopezia, love-lies bleeding, love-grove, marigold, mignonette, nigella, six varieties, petunia, 18 varieties phlox, monthly pinks, 12 kinds of poppies, portulaca, snapdragon, eight varieties sweet peas, spider plant, sunflowers, spiral mignonette and three varieties zinnias. There are eight plants that look like abutilon; we are very sure they are, but they have not blossomed yet. There are 12 varieties of plants unknown to us, and we lost about as many more trying to transplant. The pansy seed and verbena and asters and some others did not come up. Mamma says that the ground was not warm enough. I shall be more careful if I ever get any more. I sent you some wild goose beans by mail last May. If they did not reach you I will mail you some more.

From your loving niece,

ELLA K. BARRETT.

New Haven Co., Conn.

[The beans came and are growing nicely.—U. M.]

DEAR UNCLE MARK: This is my first letter to the RURAL, I would like to be a member of the Y. H. C. I am a girl 10 years old. I have two sisters and three brothers, besides Papa and Mamma. We have four horses, two calves, and 10 pigs. Papa and the two boys commenced stacking to-day. All our cutting is done except the flax. The only pets we have now are three cats and a dog. We had a Jack rabbit, but he was so wild he ran away. I read the Cousins' letters, and like them very much. Your niece, BELLE

Aberdeen, Dakota.

DEAR UNCLE MARK: The Garden Treasures are very pretty, especially the sweet peas. We have one white sweet pea, something we never saw before. A great many neighbors want seed. I have two pet doves, they are as black as a crow. Papa has three working horses and three colts. Papa will begin thrashing next week, and then he will be busy till Winter sets in. Well, I must close, for it is supper time.

Your niece, LOIS H. SCHADT.

Greenville, Penn.

[Supper time is a good time to stop. I can forgive almost anyone who leaves me for a good supper. Those doves are funny.—U. M.]

Miscellaneous Advertising.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
In my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.

"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARNES, Easton, Md.
"This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MESSELMAN, St. Paris, O.
"I have sold over $200 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.

The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, $2.50, $1.25, and 50 cents per package. 25 pound cans, $12.50.

SPECIFICS.

Sold by Druggists, or sent postpaid on receipt of price.—HUMPHREYS' MEDICINE CO. 109 Fulton St. N.Y.

BLAIR'S FODDER SQUEEZER
A GRAND SUCCESS. 10,000 FOR 1888.

With this instrument one man can do the work of two with greater ease and much more expeditiously. Not only for tying Corn Fodder but for most all like bulky material in shock or bundle. For sale by hardware dealers. Send stamps—50c.—by mail for one, without rope. E. BLAIR, Bucyrus, Ohio.

PERSONALS.

EIGHT of the original thirteen of the Emerton family at Bucksport, Me., are living, and their combined ages are 807 years.

MARTIN IRONS, who was so prominent as a leader of the Knights of Labor during the strike on the Gould system of railroads last Summer, is now boss of a second-class hash house in Kansas City.

"LORD BRASSEY of Bulkeley" is the title which the husband of Lady Brassey will wear in the House of Lords. Bulkeley is said to be the name of a small patrimonial estate which has been possessed by his family for over 400 years.

H. C. FARNUM, of Savage & Farnum, proprietors of the Home Stock Farm, Grosse Isle, Wayne Co., Mich., has just arrived here with a large importation of splendid Percheron stallions and brood mares, selected by himself from the best stock in France.

THE President has appointed Mr. John Goode, of Virginia, lately rejected by the Senate as Solicitor-General, to be special counsel on the part of the United States in the suit instituted at Columbus, Ohio, to test the validity of the patent granted the Bell Telephone Company.

HENRY WORTHINGTON of, Geneseo, Ill., is a nice young man—a very nice yonng man. During the long evenings of last Winter, instead of fooling away his time in reading or studying, or sleigh-riding with the girls, he made a patchwork quilt. It contains 6,022 separate pieces. Henry is just 21 years old.

THREE American horses are to be shipped to Rosa Bonheur. One was bred on the Sun River, in the Rocky Mountains; another is a wild horse caught on the head-waters of the Niobrara, and the third is a mustang from the Brazos River, Texas. They are designed as specimens of horses used on our frontier.

THE late Samuel J. Tilden always stuck up for the dairy interests of the country, so, very appropriately, his head will now be the vignette on the oleomargarine stamps. His likeness is already in the hands of the Government engraver. Only the heads of dead statesmen are engraved for Government vignettes.

CANON BAGOT, spiritual adviser to the Queen in Ireland, and probably the most prominent advocate of dairy improvement there, is now in Colorado. His visit to America is for the purpose of securing to the beneficiaries of his will the estate of Robert Nument Moore, who died in New-Mexico last March, possessed of property valued at $350,000.

COUNT VON MOLTKE plays amateur farmer at his country place at Creisau. He likes to go over his fields and to prune the young trees planted in the park. He insists upon having home-grown fruit upon his table, and he enjoys talking to his guests about it. He has built a school-house on his estate, and he often visits it, listens to the teaching and questions the pupils.

THE other day the widow of Santa Anna, the famous Mexican General and several times President, who was whipped by Gen. Houston in 1836, in the "War of Independence" of Texas, and again, 10 years later, by Gen's. Taylor, Scott and Lane, in the "War of Annexation," died in Mexico, and last Tuesday his son, Don José Lopez Santa Anna, aged 65, and very wealthy, shot himself through the brain at Havana, Cuba.

THE Crown Prince of Germany accidentally burned his right hand the other day, and instead of waiting for a doctor, he promptly drove to an hospital and had the hand dressed at once. As he disappeared with the injured member done up in black silk, the medical students shouted with admiration. In a very short time now he must become the most powerful Emperor on the globe, as his father cannot last much longer.

BOB INGERSOLL is growing fat. He isn't any balder than formerly, for that is impossible. His eye-glasses have changed to spectacles and his chubbiness is turning to fleshiness—even to flabbiness. His years are beginning to tell, but his smile and twinkling eyes are the same. Ingersoll has a habit, when interviewed, of writing out both questions and answers, and reading them over before the reporter goes.

MR. WYNANS, the Baltimore millionaire, pays, it is reported, $85,000 rent for his Scotch shootings. Not a shot has been fired on some of the "reserves" for five years. They are patrolled by the keepers on a regular system, which reminds one of the methods of the Irish police. The men, kept under severe surveillance, meet at certain hours at certain appointed stations, while there are solitudes in the middle of the wilder ranges on which even keepers and gillies are forbidden to intrude. All the trout streams are strictly preserved; so that the fish, the deer, the grouse, and ground game for once ought to be having a happy time of it.

It IS money in the Pockets of FARMERS.

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1910. NEW YORK, SEPTEMBER 4, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Horticultural.

THE GOLDEN QUEEN RASPBERRY.

IN the Summer of 1882 Mr. Ezra Stokes, of Berlin, Camden County, N. J., while having his crop of Cuthbert Raspberries picked for market, had his attention called to a cane found growing in this patch, producing a light-colored berry. From this beginning came what is known as the Golden Queen Raspberry. During the strawberry season of 1884, after inspecting Mr. Parry's new seedling strawberry, having heard of Mr. Stoke's intention to put this raspberry on the market, I visited the Golden Queen in its home. It was too early in the season for the fruit to be ripe. The canes, however, were well loaded with immature berries, and presented a vigorous growth, closely resembling in appearance the Cuthbert. In the Spring of 1885, Mr. Stokes sent me a dozen of the plants for trial. I selected a dozen Cuthbert plants of equal vigor from my grounds, and set them in rows side by side. I also put out, the same day, a dozen each of Raucocas and Marlboro. That year the Golden Queen bore a few berries—just sufficient to give the flavor. In vigor of growth it was like the Cuthbert, by its side. The past Spring, the canes were alive to the extreme tips in both the Queen and Cuthbert, and the former proved quite as hardy as the latter, which for years has been perfectly hardy.

I cut back both varieties the same day, and to a length as nearly alike as possible. The buds of the Golden Queen burst several days before those of the Cuthbert, Rancocas or Marlboro. The Golden Queen and Cuthbert blossomed at the same time, and ripened the first berries together.

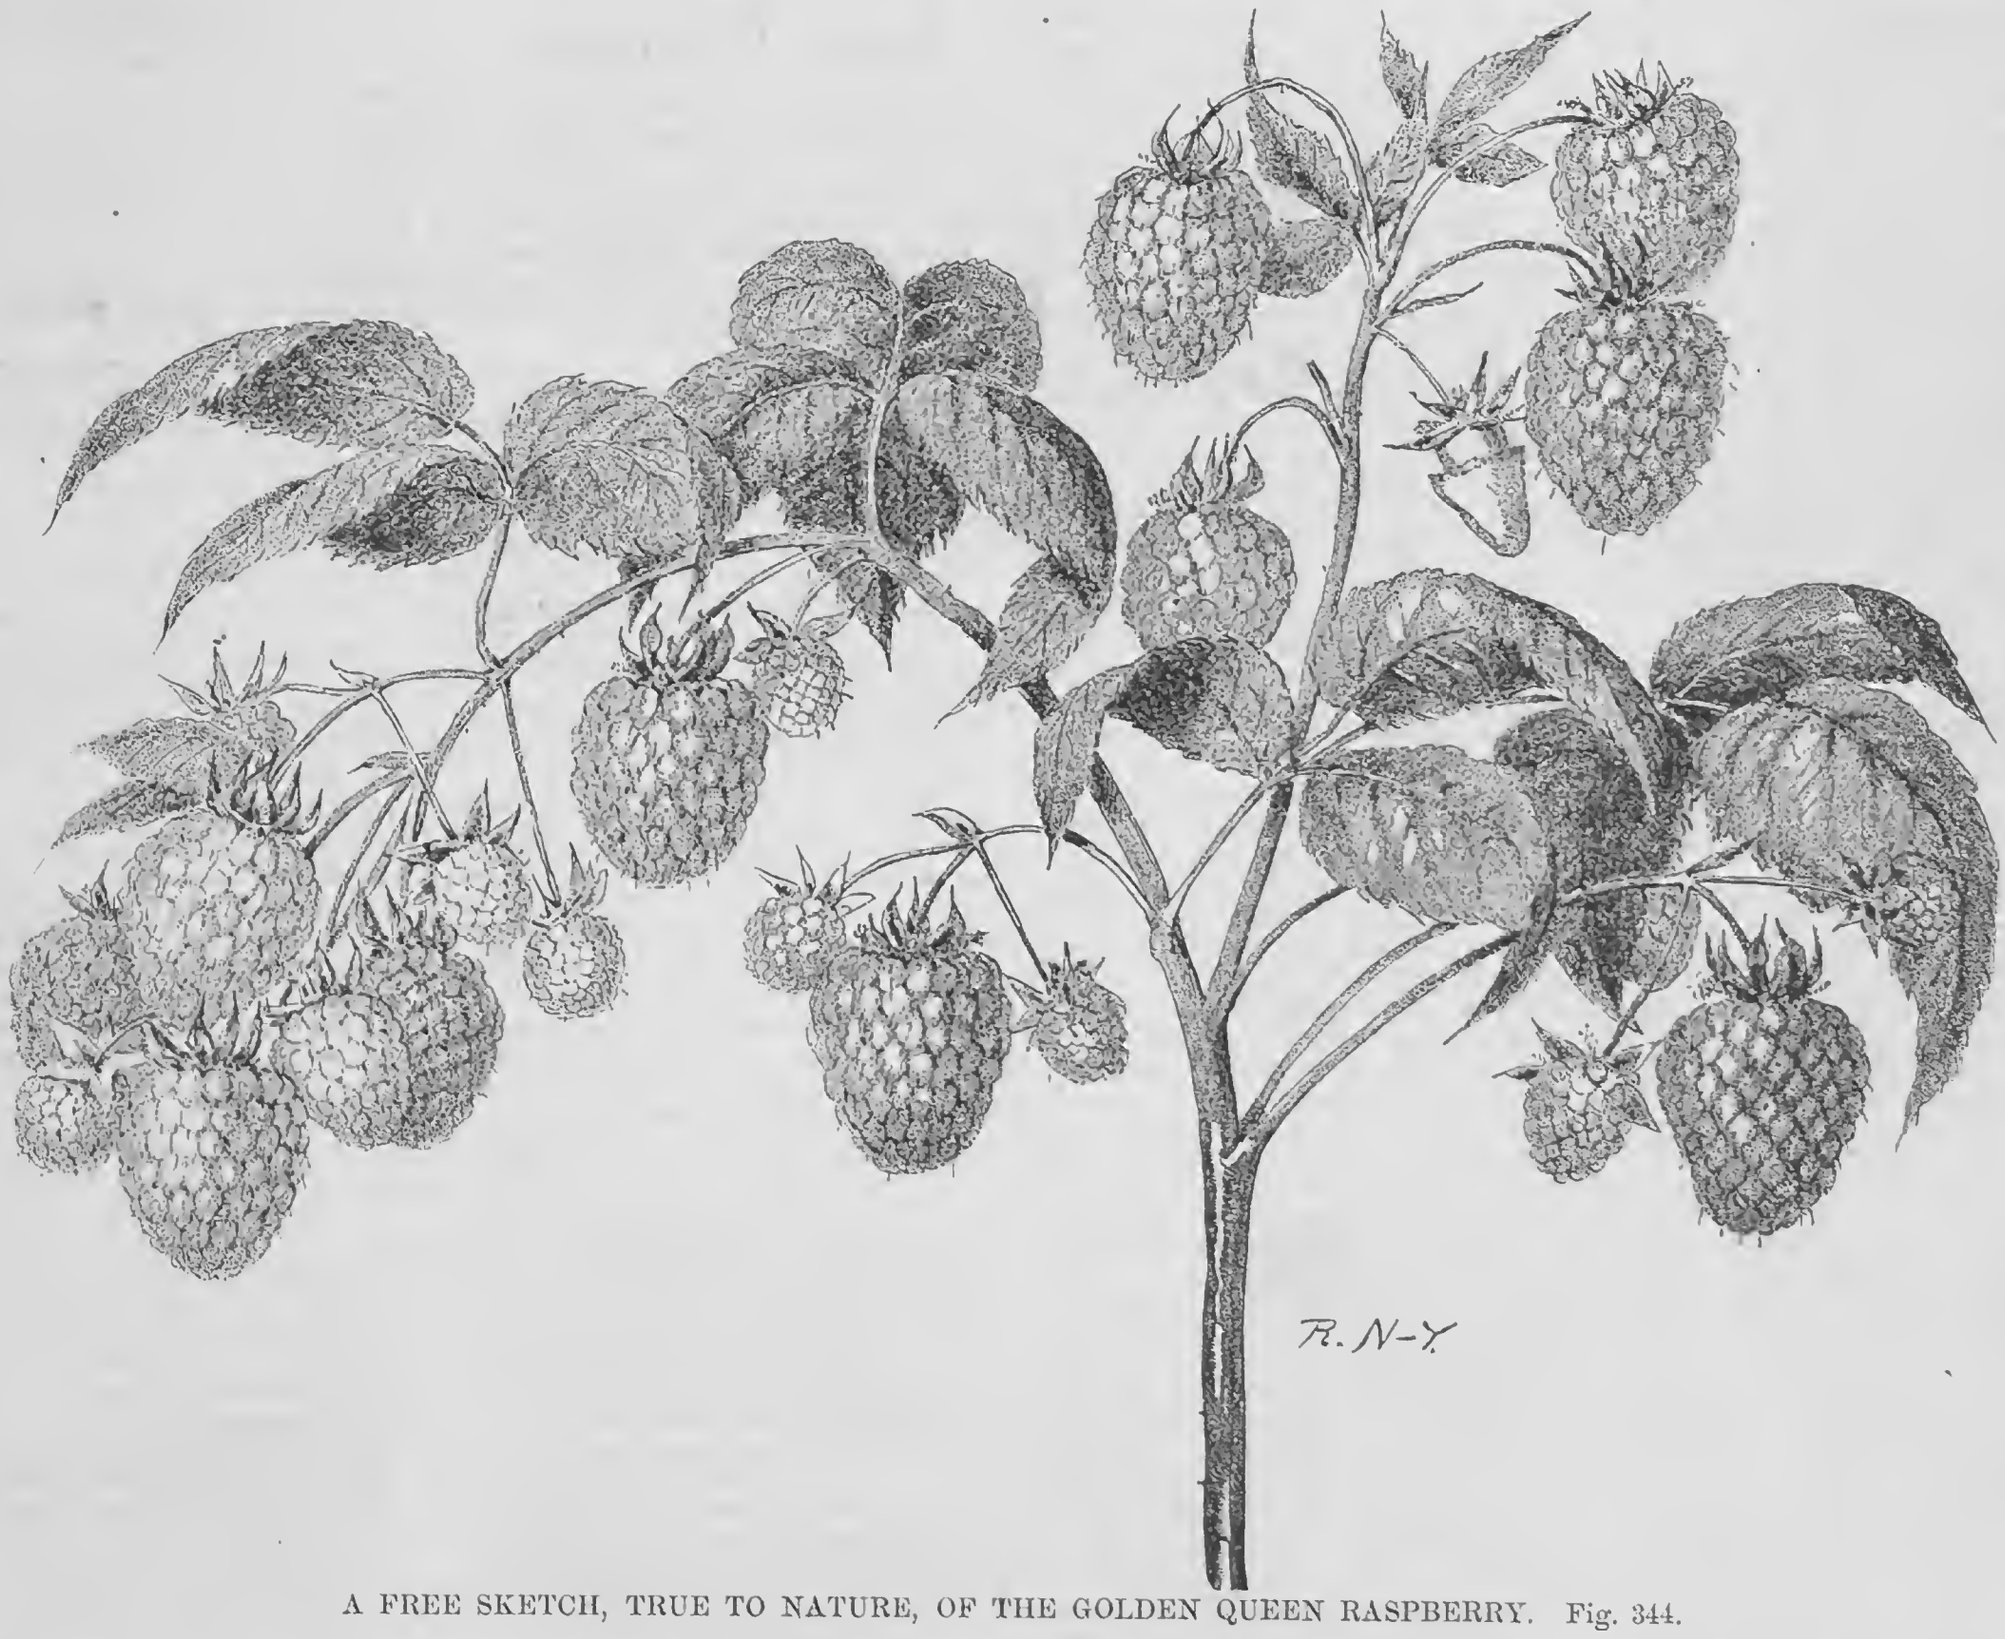
On July 12, 1885, I visited the Golden Queen on the grounds of Mr. Lovett, and there saw nearly half an acre in bearing. Except in the color and flavor of the berries, the Golden Queen resembles the Cuthbert in all respects, both in plant and fruit. In flavor it is more sprightly than the Cuthbert, and equal to it in firmness. The Rancocas with me is a poor grower, and the berry is of small size. On my grounds the growth of the Marlboro is like that of the same variety on the Rural Grounds. The plants made a good, vigorous growth last year, but the Winter killed all of the more vigorous, leaving all the small canes. They have made a sickly growth and have borne but little fruit. J. B. ROGERS.

[Our engraving, Fig. 344, is made from a specimen sent to this office by Mr. J. T. Lovett, who also sent us plants last year. Several of them died, and the others started late, and have not therefore made a vigorous growth. We have entire faith that the Golden Queen will be found well worthy of introduction.—EDS.]

NITRATE OF SODA FOR STRAWBERRIES, ETC.

IN the RURAL of August 21, Chas. A. Green gives his experience in the use of nitrate of soda on strawberry plants, but does not give the exact amount he uses, or tell on how much of a row or surface he applied it; and I suppose it was applied in the dry powdered state. Now, my experience in the use of nitrate has been very satisfactory, and was not followed by any ill results. I measure out one pint of nitrate and put it in ten gallons of rain water—well water will answer. I then stir it until it is completely dissolved. Then I take an ordinary watering-can, which holds about two gallons, and in the evening, before sundown, I apply it by sprinkling on the rows, which are about 200 feet long and a foot wide, making two gallons water the full 200 feet of the row. In ten or twelve days I repeat the application. I speak now of the Fall only. I have never yet used it in Spring. The results were so marked that every person who saw the rows that were treated to the nitrate, and those next to them which received none, would inquire as to the reason for the difference in their appearance, and, as far as I can observe, there has not been the least sign of burn or spotting of the foliage from its use. The effect was to quickly start the vines into a vigorous growth, giving them a deep green, clean and glossy appearance, and in the fruiting season the results were yet more plainly apparent. I kept account of the best picking, and on two rows alongside of each other made the comparison. The one which received the nitrate gave sixty-three quarts, and the other twenty-seven quarts—less than half. I shall treat the rows again this season, and will also apply on different rows bone-meal and a combination of bone-meal and ammoniated bone. As a mulch for Winter I find well-rotted stable manure, applied uniformly to a depth of 1½ inch as nearly as possible, the most satisfactory of all that I have used yet, and believe it contains more elements beneficial to the growth of the berry than any of the other mulches generally used, such as straw, corn fodder, tobacco stems, etc.

Montgomery Co., Ohio. W. BARRINGER.



A FREE SKETCH, TRUE TO NATURE, OF THE GOLDEN QUEEN RASPBERRY. Fig. 344.

WHO INTRODUCED THE SHARPLESS?

WHILE no one will wish to deprive Mr. J.

K. Sharpless of the honor due him as the originator of the Sharpless Strawberry, one of the most valuable ever discovered, I cannot think that Mr. Wilder was far from correct in mentioning Ellwanger & Barry as the introducers, for they prepared the first illustrations and colored plates, first exhibited it at the Nurserymen's Association, and gave it a place in public esteem by recommending it. While they were not the only ones who were introducing it, they were the principal men, and did more to make it popular than all others united. CHARLES A. GREEN.

Rochester, N. Y.

STRATAGEM AND PRIDE OF THE MARKET PEAS.

In the RURAL of July 24 we notice the following paragraph in a letter from Mr. F. S. Wilson, of Des Moines Co., Iowa: "I see very little difference between Stratagem and Pride of the Market Peas." We can only assume from Mr. Wilson's remark that he has not grown the peas himself, because if he had done so he would have discovered that there is as much difference between Carter's Pride of the Market and Carter's Stratagem as there is between Carter's Telephone and Telegraph Peas. Telephone and Stratagem are both of a decidedly wrinkled form in the dry seed, whereas Pride of the Market and Telegraph are very properly classed amongst the round-seeded varieties, and are quite distinct in appearance. CORRESPONDENTS' VIEWS.

When my boys got to be 14 years old I laid aside every week one dollar for each of them to be considered as wages. When they wanted some new clothes I took them into town and let them pick out samples themselves and get just what they wanted. The money for the clothes came out of their wage money, and other expenses were figured in the same way. The plan worked well in every way. My boys got an idea of business that has stuck to them. Too many boys are just taught to lie and steal by their fathers. I know men who tell their boys they must not touch an apple, or a peach, or any other fruit. Who ever yet heard of a boy who could keep away from fruit when he really wanted it and it was right before him? I wouldn't give a cent for such a boy even if he could be found. A wise man will have a barrel of fruit opened and tell the boys to go and get what they want. If they do this there won't be any sneaking about to get an apple, or any trying to hide the fact after the apple has been taken. Be fair and honest with the boys if you want them to make men.

Passaic Co., N. J. S. H. B.

I have a few grape-vines that I bought for Lady that are like "E. M. C.'s," page 547. I shall dig them up. What few ripen are of no account. They must have been disseminated because of their color, a small greenish white berry. The chickens will hardly eat them. I wish I could get wool waste as cheap as "H. H.," page 547. Hair is one of the best fertilizers for potatoes, and I think wool would be as good. J. M. M.

Green Cove Springs, Fla.

Washington is a grand city, full of libraries and schools. It is a fine place to visit, but who would want to bring up a family there? The whole spirit and sentiment of the place are averse to work. The poison of indolence is in the very air. The children early learn to shirk. Their education teaches them that hand labor is a little "off color." The higher schools try to fit children for getting a living without work. This is true, to a great extent, of all large towns and cities. When farmers rush to the cities for an education for their children they often do themselves a positive injury. Stay on the farm. There is an education there worth far more than that you can get in the city. E. D.

Fairfax Co., Va.

Farmers who try to buy wit for their boys will find that it costs more than it comes to. A neighbor of mine has found this out to his sorrow. He started some years ago on a new farm and worked like a slave to bring it up into shape. He had a large family of boys, and they were all sent to school, Summer and Winter. The man said that as he never had any chance himself he proposed to give his boys every chance they wanted. Every one of them had to have a horse and buggy to drive by the time he was eighteen, with money to spend at every dance within ten miles. The man bought a new farm, giving security on his old place. The family was strong-handed in the house and out, if the boys had only been brought up to work. They had the nicest chance in the world to get a fine place, but instead of that they lost the whole thing. Those boys would not settle down to work at all. They went driving round over the country and let their father hire help. The result was that he could not meet his payments and had to give up. That is what comes of this way of thinking that our sons must have an easier time than we had. That is all nonsense. There is no reason why a farmer should make a slave of himself in order to keep his son in luxury. It is tough knocks, the rough rubbing against the world, that make a man; and it is most mistaken kindness to try to pay a boy's way for him. OLD FOGY.

Hardin Co., Ky.

This year we have had all the fruit we could eat. We began with strawberries and are now eating apple sance. We have fruit on the table at every meal; not a little taste for each one, but a regular dish. We have had no sickness. I figure that we have saved at least $20 in the meat bill since May. We are all healthy and fat. Fruit-eating not only brings good temper and comfort, but it saves dollars.

Orange Co., N. Y. W. L.

Different people have different hobbies regarding health. I have mine. Some people want one kind of patent medicine and some another. I take my medicine in the shape of plenty of fruit, lots of cold water and a coarse towel. The fruit I eat. A part of the water I drink, but the most of it goes on the outside of the skin. I never could begin the day's work right without a bath all over with cold water. In ten minutes I can sponge myself all over and rub myself into a glow. Those 10 minutes do me more good than an hour more in bed would do. When I come in to dinner, with clothes just dripping with perspiration, I don't sit right down to the table as I am. In 10 minutes I can rub myself all over with a coarse towel and change my underclothing. The wet clothes, hung out in the sun, will be all right for the next day's change. I enjoy my dinner far more than I would if I sat down wet and hot from work, and the 10 minutes' time is never lost. This practice pays me well, and I would not discontinue it for anything. I am well satisfied that there are dozens of diseases that can be rubbed out of the system with a coarse towel if they are only taken in time. Try it, farmers, and see if it doesn't pay you. H. K. FARMING IN THE MOUNTAINS OF WEST VIRGINIA.

CHARLES A. GREEN.

One of the advantages of traveling is the sense of satisfaction one feels with his own home on returning. We are apt to suspect that our farm is beset with undesirable features: it is too high or too low, too distant from the city, too sandy, too clayey, too thistly, too stony. There is always some drawback which at times we lose sight of, then again behold with all its depressing influences. If the reader is dissatisfied with his farm, let him come to these farms on the rough mountain sides of West Virginia, and he will be forever contented. The farmers of many of the fertile farms of the Eastern States, as well as the garden-like prairies, complain of small incomes and hard times. Let them come up here and learn how people, often handicapped with large families of small children, or poor health, live on a tenth of their income. A farmer who has scratched a living here for 17 years was visited yesterday. His shanty is 400 feet above the Cheat River. Going up is like climbing a ladder, the rounds of which are rocks, stones and stumps. The path was made by a water-spout that burst near the farm house with a noise like the roar of a cannon, tearing bolders and huge trees from the mountain-side. The farmer with two little boys and two girls, the elder 15 years of age, is planting beans in a field large in their eyes, but to me like the corner of a kitchen garden. He marks the ground with a plow that resembles those used in Egypt in the time of Joseph and the seven years' famine. It had been a shovel-plow, but the point had been reduced by wear until it was about the size of my hand. The soil was lumpy and soddy, and might have been as well prepared by the old long-nosed breed of swine. Hill-sides adjoining, as steep as the steepest roof, were planted to corn and potatoes. I would not risk cultivating them, fearing my horses would misstep and roll to the bottom.

Squirrels were destroying the freshly planted crops, though fought with poison as we fight rats. Grasshoppers cut down the pastures and meadows, and storms make gullies through the yielding earth. A long, lank man was splitting rails under the scorching sun for a fence to keep the cows out of the corn. No barns were visible—simply coops and cribs. If this farmer were called upon to pay a debt of $10, it would trouble him more to pay it than it would a New York farmer to pay $500. And yet this man is happy and contented. He knows of no better country, and would not exchange his farm for one in the Genesee Valley, with the New York Central Railroad given in place of a chromo. He is a dignitary in the village church, and delights in telling how he "ousted a dirty-mouthed clergyman," showing up his judicial capacity in managing the affair, shedding tobacco juice right and left meanwhile, in a way to excite astonishment as to where the saliva all came from. He is sallow, long, lank and frowzy, with scant hair, straggling chin whiskers, long, bony hands, and yet, withal, he has an intelligent twinkle of the eyes, and is a good talker in his own vernacular.

"Pertaturs es my crap. Ye can grow three hills of pertaturs wher ye can grow two of corn, and ye get three leetle ears of corn from a hill and half a peck o' pertaturs. All the folks buys pertaturs, must hev pertaturs. I live on pertaturs. Pertaturs is the best crop as I grows." How he gets his *pertaturs* down the mountain sides is more than I can explain.

"Why don't you plant the hillsides to grapevines, my friend? You have just the soil, climate and exposure desired." "Yas," he replies, "but the law won't let us make wine, and the folks hereabouts can't eat grapes by the acker. But there's Bill Bascomb over thar' as has made a heap o' money at it." The truth is the man has no money to buy vines with, and lacks the necessary enterprise. It is a wonderful country for fruit, and many are succeeding in that line. This farmer sells his apples at $2.50 to $3.50 per barrel in his village. He paid $2.50 for three apple trees. The price was $3, but $2.50 was all he had, and the agent wisely accepted it in full.

Rollsburg, W. Va.

Farm Economy.

THAT MANURE QUESTION AGAIN.

Crude manure shouldn't be covered; surface manure as a trap for catching atmospheric fertility; best effects from surface manuring; manure as a mulch; a lost opportunity; shortcomings of crude manure plowed under.

The question submitted to the readers of the RURAL of July 31 in regard to the effect of manure spread in February, as compared with that spread in April, is a very interesting and important one, though not entirely novel. Analogous—though hardly parallel—cases have been observed and noted before, very noticeable differences between the effects of surface manuring—more especially upon grass lands in Winter and in Spring—have often been observed and discussed. I am satisfied, from much experience and more observation, that it is a gross mistake to cover any manure not digested by the use of chemicals, with earth. I am not sufficiently versed in chemistry to understand why it is so, but I am certain that a larger proportion of the elements of plant growth are set free from the same amount of crude manure when exposed to the free action of air and water than when covered by the earth, though but very lightly. I have long entertained this opinion, though I do not know how well founded it may be, that, if the atmosphere does really contribute anything toward plant growth, manure upon the surface of the ground is the most effective trap for catching it, and that it acquires aid from that source in its own more complete digestion. Of course, the best effect upon the soil from surface manuring is produced when the manure is kept so moist as to be constantly giving out its soluble elements in the drip. In the case under consideration, the spread manure had been for two months dissipating its plant food, which had been taken up by the soil below it from the permeating solution.

Meantime the manure in the heap had lost more or less by evaporation and fermentation, and gained nothing from the atmosphere. In the one case the greater part of the plant food had been made readily assimilable and distributed all through the soil, where every rootlet was able to find its due proportion. The friable condition of the soil was doubtless largely due to the action of the manure as a mulch, but not wholly. No amount of mulching with a clean material will render a poor, tenacious soil friable, though, by keeping it moist, it may render it less resistant to the plow, and more workable generally. But when the mulch consists of manure the whole effect is materially different. The pores become filled to a greater or less extent with the manure deposited by the water, and the cohesive power of the particle is reduced very considerably. Once acted upon by the frost the surface never again acquires the same unyielding condition as before, but is disintegrated and crumbled. Of course these changes are very gradual; but not nearly so slow as one not accustomed to carefully observing them would naturally suppose. I have had occasion to reclaim some little pieces of almost impermeable hard-pan, from which the surface-soil had been removed in grading my grounds, and have had an admirable opportunity for noting the effects of different methods of treatment had my attention been called to the subject in season to have gone at the business systematically. As it is, I have no exact comparative data, but a much larger fund of opinion than of proven facts to support my theories.

But to return to the second case: In this case the manure was applied in a crude, practically undigested state, notwithstanding its frequent turning, and mixed mechanically with the cold soil, just when it was most needed to give the crop a good start. Plowing, harrowing and cultivating the soil till doomsday will not convert a single particle of the manure into plant food. It may distribute it all through the soil where the rootlets may find it, but it is still unassimilable until acted upon by some decomposing agent. Heat and moisture are the agents we unscientific observers recognize as most important. There is generally moisture enough in the soil but very rarely heat enough to accomplish this object. The result is that only so much of the manure as is brought to, or very nearly to, the surface actually becomes available food, and that much slower than when more exposed. We hear a great deal said about the leaching of the manure through the soil. It is a good deal more apt to leach out of the cold, damp subsoil than out of the more open, permeable surface soil. I might fill a whole page of the RURAL with accounts of observations tending to confirm these conclusions but I trust I have written enough to awaken a lively discussion, or to draw the fire of some wiser investigator.

O. S. BLISS.

The hay crop is the chief crop of New England. There is more money in it for the labor expended, than there is in any other. Selling the whole hay crop is a dear way of making money. Most of the hay should be fed out on the farm, and the manure put back again on the land. The surplus can be sold in this way without robbing the land.

Prospect, Me. F. K. L.

Field Crops.

CLOVER AS A FERTILIZER.

WALDO F. BROWN.

Objections to clover hay; ten years' experiment; a two years' rotation; worth of clover turned under per acre; how to avoid failures in clover; when to sow clover; evil of pasturing clover in the Fall and early in the Spring; Mammoth Clover most profitable.

For more than a quarter of a century I have followed the rule of sowing clover on all small grain, and yet, except when I cut it for seed, I make but little use of the crop except as a fertilizer. In the system of farming followed in our Miami Valley we need but little hay, for every farmer has each year a large straw stack and abundant supply of corn fodder, which enable him to winter his stock well without hay, if he so desires. My objections to clover hay are: first, the difficulty in curing it well, ripening as it does with us early in June before the heat of Summer has come to dry the land thoroughly and give us good hay weather; and, second, that the work of cutting and curing comes at the busiest season of the year when our corn and other cultivated crops need all our attention in order that we may have them clean and in good condition before wheat harvest.

For the first fifteen years in which I managed the farm I now own, I bought a large amount of manure at the village two miles distant, to keep my land up to a high state of fertility. As I noticed from year to year the fertilizing effect of clover, and compared it with manure, I became convinced that I could keep my land up as well with clover as by the purchase of manure and with much less cost and labor. Ten years ago I set apart twenty acres of my best land for an experimental plot, to determine whether I could grow a crop of grain every year and keep up the fertility with clover. I adopted a two years' rotation, begining with wheat with which clover was sown, the latter being allowed to make all the growth it would after harvest, being neither pastured nor cut but plowed down either in the Fall or the next Spring. I find that unless the season proves very dry, I can grow a crop of clover to its full development, after har-

vest, and I have never failed to grow enough to be of great benefit in fertiziling the soil. Our wheat was cut this year between the 21st and 27th of June; at this date (Aug. 2,) the clover has entirely overtopped the stubble and is blooming freely and on the richer parts of the field it is laborious to walk through it, the growth is so rank and tall.

Have I made my rotation clear? Half of this land is in wheat every year, and the other half in corn or potatoes. Then the part in corn or potatoes is sown in wheat, and that which was in wheat has a heavy growth of clover which is plowed down, and this part is planted in corn or potatoes. Thus you will see that I grow three crops in two years, two grain or root crops, and one fertilizing crop.

When I take a man out to show him what a growth of clover there is on my stubble fields I am usually asked, "Can you afford to use all this clover for the land? Why don't you cut it?" I smile as I reply, "Before I adopted this plan I put twelve loads of manure on an acre, which cost me $9 in money and three days of hard work with a team, while this clover has cost me only the outlay for seed and sowing, which is rarely $1 per acre. My land is cleaner and more easily worked than if I used manure, and I believe that under this plan I get $15 for one, for I value my clover crop at that for fertiliziug. By this plan I can fertilize as many acres as I choose each year, while if I depend on manure it is often impossible for me to get half what I need, or to find time to draw it if I could get it. In a wet time, when the fields are soft, I cannot wagon over them at all; but that is just the weather when my clover makes the most rapid growth. Understand, I do not depreciate the value of the manure we save, and I apply all I can get at home; but I no longer buy and draw it from the village.

"But what do you do when you fail to get a stand of clover?" I hear some old farmer ask. Well, to tell the truth, that would seriously interfere with my rotation; but I don't have failures. "How do I avoid them?" First—I make sure that I have good fresh seed, by either growing it at home or buying it of a neighbor (usually the latter); but if I buy from the stores I test it. Second—I sow early on a bright, clear morning, when the ground is frozen sharp and I am sure of a rapid thaw before noon. This covers the seed thoroughly and it is sure to grow, and not till the right time. It will not sprout as quickly when covered in this way as it would if lying on the surface, and if it does sprout, the earth protects it when another freeze comes, and if the weather is dry and the sun hot it does not perish as it would if lying on the surface. "But you lose the fall pasture?" Yes; and it is a loss greatly to my gain. A large percentage of the clover of the country is permanently injured by pasturing after harvest, when the plants are tender and much of the land sown in clover receives little or no benefit because of this, and turning on it too early in Spring. One great benefit clover imparts to the soil is by its dense shade, under which chemical action is induced and nitrates are formed, and plant food in the soil is rendered available, and fields which are closely pastured fail to get this benefit. My plan of utilizing clover also saves all injury by tramping, which, on clay lands is considerable and cannot be avoided if the clover is fed off. Incidentally also you will notice the saving of fences, for I have done away with division fences on 60 acres of my 90-acre farm.

Six years ago I sowed the Mammoth or Sapling Clover, on four acres as an experiment, and every year since I have had a field of it. I think it more profitable for most, if not for all purposes, than the common Red Clover, and think that hereafter I shall sow nothing but the Mammoth. It makes a much larger growth and shades the land more thoroughly. It is about a month later, and usually the weather is hotter and the land drier, so that it is more easily cured if cut for hay. It yields more seed, and as it seeds in the first crop and can be cut and thrashed in August, there is less risk in curing and thrashing it than with the common variety which must stand later. For hay it outyields any variety of grass or other clover I have ever seen, and stock do well on it. I can from six years' experience heartily recommend farmers to give it a trial.

Floricultural.

THE ROSE, MARSHALL P. WILDER.

Among Hybrid Perpetual or, to use a better name, Hybrid Remontants, we have always regarded Alfred Colomb as one of the very best of its class. Two or three years ago Ellwanger & Barry, at the writer's request, sent us among others, one of their own seedlings which they had named Marshall P. Wilder. It has bloomed with us for two seasons, growing within a few feet of Alfred Colomb which it in many respects closely resembles. Both are seedlings of General Jacqueminot. Both are vigorous growers and, so far as can be judged, hardy and equally so. The buds and flowers are closely alike, the buds being round and slightly conical, the flower very double, level-topped and very fragrant, though Wilder was thought to be the more fragrant. The buds are large, the outer petals of a dull, dark red, like those of Comtesse de Serenye, Caroline de Sansal, Colomb and others: but these recurve as the buds unfold and are of course concealed. The flower is of a fresh, rich crimson. Alfred Colomb is a shade lighter. Both roses often bear five to seven buds on a peduncle, the pedicels often being short—not over two inches long—smooth and slender. Wherein do the two roses differ materially? We can not say except that Wilder has given us more roses and has bloomed later. In fact since its first abundant offering of June roses, the bush has not at any time been without buds in one or another stage of development, while Alfred Colomb has not bloomed in two weeks.

Alfred Colomb is thought to be one of the best roses for general cultivation; but we must prefer its American sister, or brother rather, Marshall P. Wilder. Our reasons as intimated are (1) that it blooms more freely and during a longer period; (2) the flowers are more fragrant; (3) the plant is more vigorous.

Our illustration, Fig. 345, is from a rose carried to the office and sketched not until the petals were somewhat withered.

THE ROSE, MARSHALL P. WILDER. From Nature. Fig. 345.

FLOWERS FOR THE FAIR.

September is the month of fairs: let us prepare accordingly.

Plants in pots.—Get them ready at once. If they are planted out, lift and put them into the smallest pots you can get them into without injuring their roots. Have them established in their pots before the fair time; they will look better and keep up better.

The pots.—So far as the judges shall discriminate, an old teapot or tomato can is just as good in their eyes as the finest flower pot. only let the pots be in proportion to the sizes of the plants, neat and clean. A dirty pot is an abomination, and should weigh heavily against the exhibitor.

Collections of plants.—Let every plant be good and of its kind a creditable specimen. If you have any little, weak, sickly, trashy or scraggy things, don't take them to the fair. Aim at quality, not at numbers. Don't think that the premiums will be awarded for a large number of poor plants rather than a much smaller number of good ones. Poor stuff doesn't count at all in your favor so you may just as well leave it at home.

Arranging the plants.—Take some pains to arrange them prettily. It will count in your favor. Keep the large ones to the back of the table, and grade the others according to their size. Keep the kinds together as much as you can—the begonias together, the geraniums together, the fuchsias together, and so on. Have the best side face to the front, and do all you can to make your collection look well and to the best advantage.

Collections of cut flowers.—Make the best exhibit you can, but again let me advise you to give preference to quality rather than quantity. Have some style about your collection. Let every blossom you exhibit be a first-class flower or bunch of flowers of its kind. Don't mix them up helter-skelter as if you had dumped them into an ash barrel. Make as large a display as you please, have as big bunches as you please, but don't have dahlias scattered all over the lot, or geraniums, asters, marigolds, petunias or other flowers, but have all your dahlias near together, the same with your phloxes, zinnias, salvias and other flowers. Use rose geraniums, wood ferns, or other "greens" to tastefully set off your flowers. Have some get-up about your arrangement.

Cut blooms of one sort of plants, as for instance, asters, or roses, or dahlias, or gladioli. Take dahlias for example: keep all the whites by themselves, and so on with the reds, crimson, mottled, and the like, and grade them so that the large blossoms shall be at the back and the smaller ones to the front. Mixing them up in size or color is contemptible taste in exhibition, home or any other kind of decoration. If your notion in mixing is to make the judges think you have a greater variety than you actually have, please undeceive yourself. The judges have something else to do than unravel the intricacy of any nasty muddle.

Bouquets.—Use a few rather than many kinds of flowers, and arrange them so that every blossom shall appear unruffled and in perfection. Don't use wires, sticks, or other unnatural stems. Let the bouquets be small rather than large. Let white be the prevailing color, and avoid incongruous and violent mixtures. Don't have a conglomerate mass of little and big blossoms. Use the very best material you can command, and arrange it with all the elegance and loveliness your mind can devise. Be very particular about the stem of the bouquet; see to it that it is neatly tied and finished off. Don't think because the bouquets are stuck into little vases filled with water that the stems are hidden. Oh, no; the judges lift them out of these vases, and examine the stems as well as the tops; and don't think that the little greenery you stick into the vases around the bouquets will be overlooked, for nothing except what is tied up in the bouquet is reckoned any part or parcel of it.

Indust'l Societies.

THE FLORISTS' CONVENTION.

(RURAL SPECIAL REPORT.)

Blending of business with pleasure; the floral display; lively "experience meeting;" a trip to the ocean; election of officers; a floricultural circus; luncheon at Wootton; organization of a hail insurance company; the ladies; a good time all around.

The Society of American Florists held their second annual convention in Philadelphia August 18 to 21, both days inclusive. The affair was a tremendous success, both professionally and socially. Indeed, the social part of the affair was so liberal and extensive that there were some murmurs from the ferociously industrious members, who feared that this would interfere with business. However, the business part of the programme was fully followed out, resulting in the ventilation of many new ideas and new methods in floriculture, while the social gayety removed any danger of overtaxed brain power on the part of the members.

The meetings were held in Horticultural Hall, on Broad Street. The upper hall, devoted to business sessions, was tastefully decorated, the balcony being draped with laurel and the stage arranged with foliage plants, while over the speaker's desk hung the word "Welcome" in immortelles. The lower hall was devoted to the exhibition. This, though not very large, comprised some excellent features. Two tanks filled with aquatics were of much interest. One contained cut specimens of the Sacred Lotus (Nelumbium speciosum). The superb rosy-pink blosssoms were mingled with leaves and seed-stalks, making a most artistic group. The other tank contained nymphæas, white, blush-pink, rose, and blue, of most delicious perfume. There were also leaves of the giant lily, Victoria Regia—great saucer-like shields that are often eight feet across, borne on cable-like stems set thickly with cruel spines.

A quantity of gloxinias and tuberous-rooted begonias made a fine show, backed by fragrant white lilacs, grown in pots. Some new ferns were exceptionally fine, and a large collection of very spiky cacti grinned cheerfully at the passer-by.

Seeds, bulbs and florists' appliances made another useful and comprehensive exhibit, the display of baskets being very large. But here let me make a plaintive protest against those awful decorations (!)—dyed Pampas Plumes! Nothing can be more graceful than this grass in its soft, native hue, but when ruthless man dyes it an aniline green or magenta, or purple, it is a sight to make angels weep.

The convention was opened with an address by Mr. Mitchell, of the Pennsylvania Horticultural Society. He introduced the Mayor of Philadelphia, who welcomed the society in a very happy speech.

Next Mr. Peter Henderson told "What the Craft Has Been Doing the Past Forty Years." His essay was both instructive and amusing, and at its close some of his contemporaries were requested to give their experiences, which were another source of amusement to the audience.

At the afternoon and evening sessions essays were read on Treatment of Tea Roses During the Summer, by Antoine Wintzer, West Grove, Pa.; H. P. Roses for Out-door Summer Blossom, John Henderson, Flushing, L. I.; Pot-grown Roses for Market Purposes; Robert Craig, Philadelphia; Fungoid Diseases of the Rose; H. J. Sackersdorff, Bayside, L. I.; and Pot-grown Foliage Plants for General Purposes, by James Taplin, Maywood, N. J. These essays were followed by very lively discussions, and the evening session had the excitement of keenly-contested debates on subjects drawn hap hazard from the "Question Box." Perhaps nothing provoked such close debate as the subject of great plant auctions and their effect on small florists. It is the general opinion, even among the great florists who supply these auctions, that they cripple the local trade of smaller growers to an alarming extent, and what are we going to do about it!

On Thursday there was no business session, the entire convention going in a body to spend the day at Atlantic City. A special train was chartered by the Florists' Club of Philadelphia, and a fine dinner was given the excursionists at the United States Hotel, the number of guests being nearly 650.

On Friday morning the Convention met with great promptitude, and devoted themselves to business so as to prepare for the afternoon, when G. W. Childs, Esq, gave them a reception at Wootton, his beautiful country seat at Bryn Mawr. The first business in the morning was the election of officers for the ensuing year. These were elected unanimously: Robt. Craig, Philadelphia, President; Edwin Lonsdale, Philadelphia; Secretary; Myron A. Hunt, Chicago, Treasurer; J. C. Vaughn, Chicago, First Vice-President.

After the election Mr. Le Moult gave his exhibition of floral designs. He marshalled a number of employés, both men and girls, on to the stage, where they started on the formation of a Wheel of Fortune. While they were at work, Mr. Le Moult exhibited designs in immortelles. The first was: a life-size Shetland pony; this was followed by the steamer Amerique, the yacht Galatea, a Venetian gondola, a life-size lion, and several others. Mr. Le Moult's remarks were often amusing, and so were the comments of the audience, who for the most part seemed to regard this part of the exhibition as a floricultural circus. The fabrication on the stage, though plain enough to professionals, would give very little infor-

mation to those unacquainted with the process. The Wheel of Fortune winged, and surmounted by a cornucopia, was finished in an hour and twenty minutes; it was about five feet high, and a very effective design. In the afternoon it was presented to Mr. Childs.

In the afternoon the convention adjourned most unanimously to go to Bryn Mawr. They numbered about 750, and were taken out on a special train in two sections. They were welcomed with the graceful hospitality for which Mr. Childs is famous, were given the freedom of the place, and were entertained with charming music and an elaborate luncheon. Mr. Childs was enthusiastically cheered, and after shaking hands with the entire convention, he sent his happy guests back to town on their special train.

Friday evening was devoted to essays and discussions on steam *versus* hot water, resulting in a majority for steam. Specialists were appointed to study the subject, and report upon it at the next meeting of the society to be held in Chicago.

On Saturday morning the final session was held to appoint a committee for the organization of the Hail Insurance Company. Chairman, J. M. Jordan, St. Louis; H. A. Silbrecht, New York; J. G. Esler, New Jersey; J. C. Vaughn, Chicago. This hail question is a very awkward one, as a national insurance while benefiting Western florists within the hail section, would merely impoverish Eastern men, who do not suffer from destructive storms of this character. On Saturday the Ladies' Reception Committee, composed of Mrs. G. C. Evans, Mrs. Mary Bissett Rumel, Mrs. Robt. Craig and Miss Ferguson, gave a drive to the visiting ladies, taking them through Fairmount Park, calling at many points of interest and including a charming luncheon at the Belmont Mansion.

The business part of this convention contained much of interest and value, while the social part was of unusual liberality. The only drawback, as some of the business-like members fear, is that it will provoke too much emulation among cities visited, and this cannot fail to be prejudicial to the society's usefulness.

However, all the visitors cannot fail to long remember Philadelphia's generous hospitality; and whatever may be the society's ultimate fate, the convention of 1886 will remain the most thoroughly enjoyable in the history of horticulture. E. L. TAPLIN.

A FARMERS' PICNIC.

We have recently enjoyed a farmers' picnic, under the management of the Western New York Agricultural Society. Professor I. P. Roberts's lecture on this occasion was one of the best I have ever had the pleasure of listening to. The Professor was taken to task in a good-natured way, by one of our leading farmers, for stating that farmers could wear gloves at many kinds of work—such as reaping, thrashing, etc. Nothing daunted, the Professor replied—"I tell the girls that if the farmer boys do not know how to protect their hands so that the girls will not be ashamed of them when the boys appear in society, they had better not marry them."

Certainly there is much to be learned about the care of hands on a farm. I have seen farmers' hands so knotty, bruised and distorted as to cause us to pity the possessors. It is our duty to God and man to preserve our comeliness of person, and a well-formed hand is to be desired.

Professor Roberts said that the land-holders would be the aristocracy of this country fifty years hence; that some Englishman had said that this country produces enough milk each day to fill the canal from London to Birmingham.

Farmers, remember that you are Americans, and that Americans are destined to lead the world in agriculture and commerce. Do not be satisfied to cultivate well the land; cultivate your minds. Work less with your hand—more with your heads. Look sharp to your votes. If you confine yourselves too closely to the plow, wily politicians may defraud you of your birthright.

President Hamilton said: "Speed the plow! If the plow no longer turns the furrow, the factories of this broad land will close, the miners will hang up their idle tools, the railroad whistle will no longer be heard, and our steamships will rot at the wharves."

Altogether this was a pleasant and profitable gathering, and one to be long remembered

THE CALIFORNIA WAY OF CANNING FRUIT.

Owing to the fact that all of the canned fruit of last season's pack has left the State, it is probable that the greatest portion of the fruit grown this year—excepting the prunes, of course,—will be canned. For my part I am sorry it is so, and for this reason, viz: it appears that the fruit canners, with all their perfected (?) appliances, are not able to make use of the fruit unless it is hard, green, and unripe. They want it hard, so they can handle it with greater ease, greater economy, less waste, and to some uninitiated unfortunates those solid halves all standing out by themselves look nicer in a jar than softer ones that necessarily press sluggishly upon each other and almost fall to pieces. But this same green, harsh-tasting fruit goes abroad among people who know how delicious good, ripe fruit, well preserved, is and the buyers consider themselves cheated out of their money when, upon opening a can of "choice (?) California fruit," they find this vile, unpalatable and very unwholesome stuff! No wonder then, that the people East, though admiring California's fruit-growing advantages, all say that California fruit is insipid, lacks sweetness, and is inferior to that which they grow at

Santa Clara Co., Cal. P. LE HARDY.

KEEPING PEARS.

I save my Bartlett pears so that they make fine eating two months after those of my neighbors have gone. I take a stout box and line it with paper, almost any kind will answer. The bottom is covered an inch deep with wheat bran. The pears are carefully picked, wrapped separately in thin paper and packed deeply in the bran until the bottom is covered. Then this layer is covered with bran to the depth of an inch, and another layer of pears is placed in the same way. This is continued until the box is full, when the cover is tacked on, and the box set away in a cool, dry place. The fruit will retain its fine flavor and color. J. S. B.

Architecture.

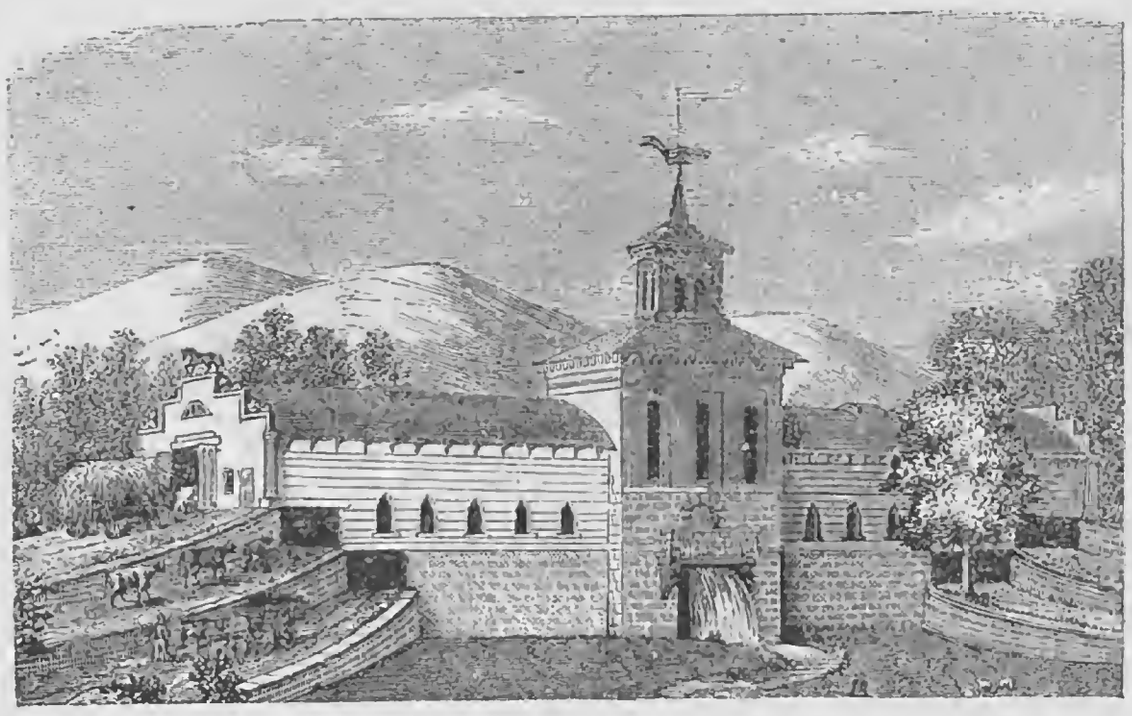
A BIG BARN.

T. H. HOSKINS, M. D.

The disposition of many country-born men who have become wealthy in our cities to repossess, enlarge and beautify the farm upon which they were born and reared, or at any rate to retire to rural life as age approaches, is very noticeable among Americans. The "fancy farms" of such individuals have been the subject of much writing in the agricultural journals, in which very different views of their influence upon the progress of agriculture have been expressed. The fact probably is, that this point has received very little consideration from the parties most directly interested in the matter. In most cases the ground of action has been mainly, if not entirely, personal in its purposes. Either the rest and healthful repose of the quiet country have been sought, or some cherished idea of how a farm ought to be carried on has lingered in the mind from the days of youthful impatience and disgust with the ancient conservatism that is still found on so many farms, and is yet exciting like feelings in the breasts of so many youthful sons of the soil.

New England is dotted over with these fancy farms, the elaborate and ornate character of whose buildings and surroundings marks them at once to the eyes of the passer-by. They abound especially in the Connecticut Valley, and the minor valleys of Western Massachusetts, a great number of whose sons have made themselves noted and wealthy in almost every branch of business enterprise. Magnificent mansions, amounting up even to seven figures in cost, have been erected; but more often, perhaps, the "fancy farmers" have prided themselves on the elaborate perfection of their barns and outbuildings, rather than on their dwelling houses. One of the most noteworthy, though not the most recent case of this kind, is that of an enormous barn erected in the town of Great Barrington, near the village of that name in Berkshire County, Mass. This barn, though really one of the most costly and complete that has ever been built in America, has received very little notice in the agricultural press, and would perhaps have always remained obscure had not its recent destruction by fire, and the trial of the supposed incendiary attracted public attention.

This curious building (shown in the illustration, Fig. 347,) was erected thirty-four years ago, on his Brookside farm, by the late David Leavitt, the grandfather of its recent owner, Henry A. Leavitt, a broker at 1 Exchange Court, New York. The site chosen was both novel and convenient. The building, 200 by 40 feet, spanned a ravine 200 feet in width and 30 feet in depth, one wall forming a dam controlling the fine stream which runs through the ravine, and was employed to furnish motive power to the numerous machines in various parts of the building. The banks of the ravine on both sides, below the barn, were used for roadways, entering each of its three stories. The lower story was used chiefly as a manure vault, the second was for stabling, and the third for storage. But, besides these, there was both a complete grist-mill, and a wood-working shop, embracing saw-mill, planing-mill, lathes, etc. There was a full equipment of farm machinery, including a corn-sheller, which could shell, clean and bag 500 bushels a day, with an elevator of the same capacity. The thrasher had a straw-cutting attachment, which chaffed the straw as fast as delivered. In the arched dairy cellar, 20 by 78, was a line of shafting with power-churning and butter-working apparatus. The hay was also pitched from the wagons to the mow by the same power, and in fact the whole work was so planned and arranged by Mr. Wilkinson, who was at once the architect and farm superintendent, as to be done in the most speedy and economical way. The total cost was stated at upwards of $100,000. Michael O'Connell, a farm hand, was suspected and arrested for the burning of this elaborate and costly structure, but has been acquitted of the crime.



A BIG BARN. Fig. 347.

The Herdsman.

IN FAVOR OF THE "GENERAL-PURPOSE" COW.

PROFESSOR G. E. MORROW.

I am not able to agree with much that is being written and published in favor of the position that it is absurd and ridiculous to attempt to breed any class of animals for more than one purpose. Especial argument, ridicule and sarcasm have been directed against efforts to secure a good degree of merit as beef-makers and milk-givers in any breed of cows. None the less do I believe that it is desirable and practicable to secure this result: that for a large percentage of the farms of the United States cows of this class—"general-purpose" cows, if you please—would be better adapted than those with marked excellence for the one purpose, coupled with inferiority for the other; and that there are vast numbers of cows which do combine in a satisfactory degree good size, form and aptitude to lay on flesh, with ability to give a good quantity of good milk. I have seen many such cows.

Beef-making and milk-giving are natural functions of the cow. It is not contrary to the principles of breeding and is in accord with experience that these functions should be well developed in the same animal. It is unusual to find them both developed to a remarkable degree. In regard to these qualities, as well as to many others, the breeder may make his choice between efforts to reach remarkable excellence in one point or a fair degree of merit in two or more. It is clearly true that in many cases the latter effort is the wiser.

Urging all breeders to select some one point, and seek to develop that to the greatest degree, is not wise. There is a demand for animals so developed—for horses with special fitness for heavy draught, or for fast trotting; for cattle especially fitted for beef or for milk; for sheep remarkably developed in the way of either mutton or wool production; but the largest number of users of either class desire animals reasonably well adapted for more than one purpose. The horse best suited to the needs of farmers generally, or for most business purposes, is neither a heavy draught nor a typical roadster, and so of the other classes of animals, even to the hog, in breeding which too exclusive attention may be given to early maturity or to ability to lay on flesh.

Aside from the farmers who keep cattle with almost sole reference to beef making, and the special dairymen, there is a vast number who know what they are about when they insist on having cattle satisfactory, both as meat makers and milk givers. Unquestionably its merit in this double capacity has been a great cause of the widespread popularity of the Short-horn both in Great Britain and in this country. It is amazing that men will continue to deny or ignore the fact that there are many thousands of pure-bred or high-grade Short-horn cows which are in a satisfactory degree, what it is denied there can possibly be, good general-purpose cows. There are many Short-horn cows that are not good milkers, many that are not good beef animals, and many that are both. The same is true in some herds of cattle of a number of other breeds. On the University Farm there is to-day abundant proof of this fact as to Short-horns. Of two Hereford cows one is a good milker, the other not; a half-blood is well above the average. There is a half-blood Holstein steer, weighing over 1,650 pounds at 28 months, and a beef animal of superior quality; a pure Ayrshire steer quite satisfactory in beef merit.

I recognize fully the marked differences in the adaptations of different breeds and of different animals belonging to the same breed, but dissent from the position that it is impracticable or always unwise to secure development in more than one direction in one breed or one animal.

University of Illinois, Champaign, Ill.

HOW TO GROW THE BEST BEEF.

Farmers in general hardly realize the extent to which their future success with cattle depends upon grading up to a high point. I refer now to feeding cattle, that is, such as are bred mainly for meat production. Stock growing and general farming are by many said not to be as remunerative as formerly. Over-production is said to be the cause of this. If this applied to cattle, it is certainly not to the higher grades, but to the lower, for, no matter how hard the times, or how depressed the industries in general are, the higher classes of steers always sell quickly at good figures. Since the discovery—for it should take rank as one of the discoveries of the age—that it is more profitable to feed cattle for meat production from early calfhood up to the period when they rate as long yearlings or at most as two-year-olds or a little past, it is indispensable that high grading up be practiced, as we cannot have marketable steers at the ages named unless they are bred from thoroughbred, or at least high-grade stock.

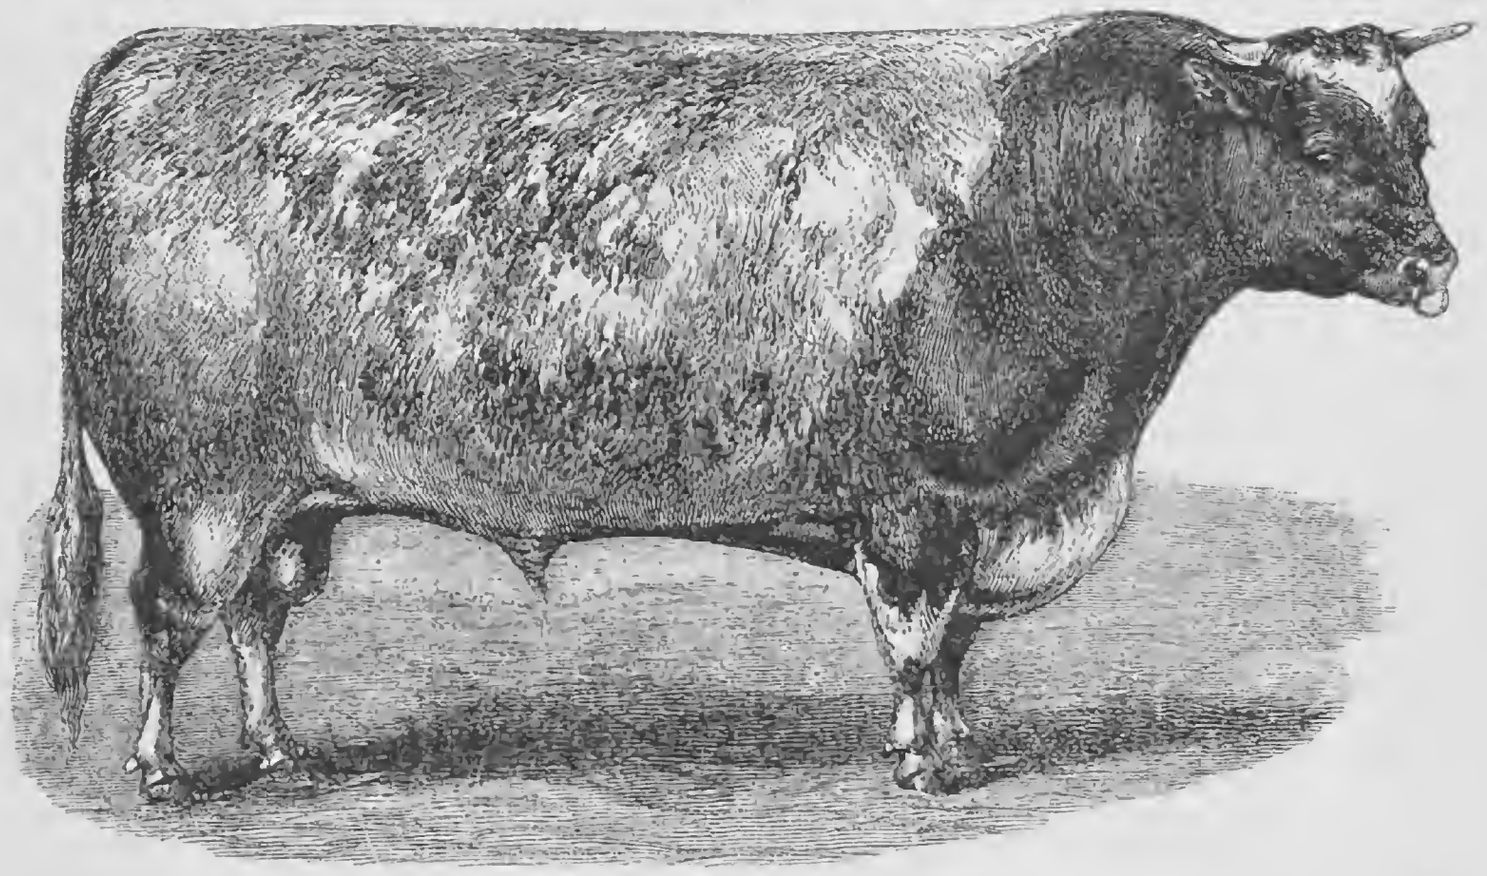
The notion entertained by many that young beef (that is, of the age named) is to such a degree immature—called, derisively, "baby beef"—as to be innutritious, is a very palpable error. After the calf ceases to suckle its dam, depending thereafter upon food like that given to grown-up cattle, the meat ceases to be veal, and, in every sense of the word, is beef, as nutritious from a long yearling as from a four-year-old. It contains the same fibrine and the meat juices are the same, though, of course, the fiber is more tender than that of the ox, without being less nutritious. In fact, it is a question not yet settled at just what age meat of any kind begins to lose ground, in point of nutritiousness, by reason of having too much age, becoming, as it is quite liable to, too hard in its fiber to be easily acted upon by the human stomach.

Digestion and assimilation in the young are more active than in older animals. Hence it is fair to suppose that the young steer will get more good from a given amount of food than those that are somewhat aged, unless they happen to have escaped all disturbances of digestion, and not every animal escapes these. We cannot get the size necessary for turning off at a young age except we breed for it, and nothing less than breeding from animals possessing a good deal of merit—pronounced merit on one side at least—will give us the required material for feeding up as long yearlings. It is not only that we require good breeding to give size, but in no less degree to spread the hips and rump, spring the long ribs well out at the upper setting on, sending them well down, forming the basis for a straight lower line; then upon this frame formation placing a thick packing of that peculiarly well-marbled flesh that never fails to bring the top price of the market. "WESTERN."

OUR ANIMAL PORTRAITS.

SHORT-HORN BULL, PRINCE OF HALNABY.

NEXT to Charles and Robert Colling, Mr. Bates, and the Booths, father and sons, have been the greatest and most widely-known improvers of Short-horn cattle, each of these having established several tribes of preëminent merit, which have won numerous prizes. At Figure 348 we present to our readers a fine likeness of the Short-horn bull, Prince of Halnaby, winner of the first prize in the "Aged Class" at the last show of the Royal Agricultural Society at Norwich. He is described as a splendid beast—"admirably formed in front, and very good over the crops," says the (London) Live Stock Journal, from which our cut has been re-engraved, "but he lacks substance slightly." He has, however, choice quality and character, and is very strong in Booth blood.



SHORTHORN BULL PRINCE OF HALNABY. Fig. 348. Re-engraved from the London Live Stock Journal.

SOUTH DOWN SHEEP AHEAD.

SOUTH DOWN sheep suit me better than any others. Merinos are good for the big ranchmen who have room for 500 or more, but most of us want smaller flocks, of say, 30 to 40. For such purposes the South Down suits me. A farmer can build up a good stock of sheep by getting 30 or 40 ewes—what we call Missouri natives. They are a mixture of all kinds generally after the old Saxon pattern: no wool on the legs or belly, average clip 3½ pounds per head. Take such ewes and run them two years with a good South Down ram. Then sell or butcher all the old stock and such of the young as do not suit the fancy. Then get a new buck, and the lambs from such a flock will be as good for wool or mutton as full-bloods J. E. B.

Johnson Co., Kans.

HEREFORDS suit me well. For general purposes in this country they are hard to beat. They are hardy, easily fattened, fair milkers and they make the best of oxen, being smart and always well mated. The raising of good oxen is a profitable business in these parts.

Hancock Co., Me. F. K. L.

My sheep are doing well, and I have already some young lambs. This is a little premature, but I shall try and make even them pay well. I am much pleased with the Hampshire-Down ram, though a late lamb last year and not by any means fat, he weighs over 170 pounds, and is very nicely proportioned and very active. J. S. W.

Lockport, N. Y.

Entomological.

THE ELM-LEAF BEETLE.

PROF. A. J. COOK.

THE Elm-leaf Beetle—Galeruca xanthomelæna (Schrank), like most of our dreaded insect pests, is an imported nuisance. It, like the potato beetle, and grape flea beetle, belongs to the Chrysomelidæ, or leaf-eating family of beetles. These are all well named, as they are voracious feeders on foliage both in the grub or larval, as well as in the imago stages. This Elm Beetle has done great damage of late in the East from New England to Virginia. As yet we are not troubled with it in the West, but we are in imminent danger of an attack at any time. The insect has been described by many of our entomologists. In the report of the Commissioner of Agriculture for 1883, the government entomologist gives a very full, illustrated article, which all practically interested would do well to procure and read. See page 578.

The small yellow beetle striped with black lays its yellow eggs in groups of from five to twenty on the underside of the leaves. In a week these hatch, when the grubs which are yellow and black, the yellow increasing with age, commence to feed upon the leaves, which they soon skeletonize, as they do not eat the veins. They feed for two weeks during which time they molt, or shed their skins, four times. After the lapse of the two weeks, the full-grown grub passes to the ground, and pupates under some kindly sheltering board or clod. It comes forth from the bright-colored pupa state in about one week. Like the Colorado Beetle the imago, or mature beetle, also feeds upon the leaves, but eats much less than does the grub from which it came. We see from the above that it requires but four weeks for these insects to mature. This gives chance for three broods a season. Thus where these insects are very common they keep the trees stripped of their leaves, and unless checked in their work will soon destroy the trees.

In the illustration, Fig 347, p. 578, the leaves are shown as eaten by the beetle. The eggs are deposited in an upright position upon the under side of the leaves as at *a*. A group of these eggs is shown at *c*, magnified. The perfect beetle is shown at *e*, magnified at *k*.

The best remedy for these devastators is to use the arsenites in water—about one pound to 100 gallons. Others would add about six quarts of flour, which causes the poison to adhere to the leaves better in case of a hard rain. For small trees a Whitman Fountain Pump would be all that is needed. If one has many or large trees to treat, it would be better to procure a large, powerful force pump. Another remedy has been suggested, which from the habits of the insect must succeed, but is faulty as it only locks the door after a part of the goods are stolen. That is to encircle the base of the tree with a close-fitting trough so guarded by a smooth shelving piece of tin on the outside, that as the larvæ descend they would be unable to pass down, and so none would succeed in developing to full maturity. As suggested, this does not kill till the insects have done their mischief and so only does good in preventing future damage.

Law.

THIS YEAR'S STATE LEGISLATION.

OWING to the evils of over-legislation, in two-thirds of the States now the Legislatures meet only once in two years, so that sessions were held in only one-third of the States this year. The only way of lessening the evils of ill-regulated and pernicious legislation appears to be to restrict the opportunities for legislation of any kind. The following are, in brief, the most important State laws passed during the year: Labor arbitration tribunals have been established in Connecticut, Iowa, Kansas, New York and Massachusetts. Massachusetts has ordered weekly payments of wages by corporations. Rhode Island requires that employer and employé must give like notice of stopping work or each must otherwise forfeit wages. New Hampshire prohibits intermeddling of strikers with other laborers. New York forbids the sale of bogus butter under a false name. Ohio ordains that genuine butter only shall be used in charitable and penal institutions in the State, and dealers in bogus butter must designate it as imitation butter and are forbidden to sell it to persons asking for genuine butter. Anti-oleo laws have also been passed by Maryland, New Hampshire, New Jersey and Iowa. New Hampshire has regulated the sale of veal. Iowa has prohibited traffic in diseased hogs. Ohio prohibits deception in dealings in grain. Michigan prohibits the adulteration of honey, and, like Maryland and Kentucky, regulates the sale of fertilizers. Kentucky imposes a heavy tax on venders of lightning-rods. Kansas punishes by fine and treble damages deception in the sale of shrubs, plants and trees. Ohio punishes hotels and boarding house "beats" with fine or imprisonment. Michigan authorizes the incorporation of mutual insurance companies to insure against losses by cyclones and wind storms. Connecticut permits corporations to distribute a part of their profits among their employés. Mississippi makes telegraph companies liable to fine as well as damages for unreasonable failure to deliver messages. Connecticut makes it a crime for officers of any public or private corporation to accept commissions or gratuities upon business of such corporation. New Hampshire forbids savings banks to act as agents for other corporations or to receive any inducement to make loans.

Georgia, Kentucky, Ohio, New Jersey, and Virginia regulate the sale of drugs. Michigan and Virginia regulate the practice of medicine, and Georgia the practice of dentistry. Iowa has made her prohibitory law stronger and more stringent. Rhode Island forbids the sale of intoxicating liquors except for artistic, mechanical, or medicinal purposes. Ohio levies a direct tax on the proceeds of the sale of liquors. Georgia, Mississippi and Maryland have passed local option laws. Congress, Connecticut and Iowa have provided for instruction in the public schools under their jurisdiction as to the effects of alcoholic drinks on the human system. Massachusetts declares women eligible as overseers of the poor; and New York permits them to vote at school meetings. Connecticut, Michigan and New York regulate the employment of children, forbidding excessive work, or work in unwholesome places. Georgia provides for industrial education for school children. Maryland, Massachusetts and New Hampshire forbid the sale of tobacco to minors. The sale of adulterated sweets is forbidden in many other States. In every State Legislature as well as in Congress there is a vast disproportion between the number of bills introduced and of those passed, and between those of a private and public nature.

LATE DECISIONS.

MEANING OF HOUSEHOLD GOODS.—The Supreme Court of Kansas held in a recent case of Smith *vs.* Findley, that the phrase "household goods" used in a contract of carriage did not include potatoes, bacon, vinegar and salt, a portion of which was sold or offered for sale after the arrival of the goods at their destination.

PATENT—RECOVERY OF LICENSE FEE—INVALIDITY.—A licensee who has paid a license fee for the use of a patent privilege of which he has had the benefit cannot maintain an action to recover back the amount so paid upon the ground of the invalidity of the patent, according to the decision of the Maryland Court of Appeals in the case of Schwarzenbach vs. Odorless Excavating Company.

PURCHASE OF MACHINE—BREACH OF WARRANTY.—Where a purchaser of a machine used it for eight months and then gave his notes for the full price, the Maryland Court of Appeals held (Adler vs. The Robert Portner Brewing Company) that he could not afterward in good faith set up the defense of a breach of warranty to an action for the price. The court took the view that the purchaser had ample opportunity to ascertain whether or not there had been a breach of warranty.

SALE OF OLEOMARGARINE. — INDICTMENT. —EVIDENCE.— Upon an indictment for the selling or offering for sale of oleomargarine unmarked, the Supreme Court of Oregon lately held (State *vs.* Dunbar) that it was not necessary to prove any overt act of offering it for sale in an unidentified condition, but that the mere possession of it and placing it in a store with other articles held for sale were sufficient to warrant a jury in finding that the same was offered for sale.

PROHIBITORY LIQUOR LAWS—STATUS OF BUYER.—In the case of Wakeman vs. Chambers the Supreme Court of Iowa held that the statute of the State against the sale of intoxicating liquors does not make the buyer an abettor or *particeps criminis*. The court said: "Under the statute the sale or keeping with intent to sell is a public offence, because the statute so declares. The statuary crime is bounded by the statute creating it, and the statute operates on and has force and effect against the persons therein named and no others. As the prohibitory statute does not provide that the purchaser is guilty of any crime, it seems to us this fact practically ends the inquiry."

AGREEMENT TO USE LANDS FOR ADVERTISING PURPOSES. —The nature of an agreement selling the right to use fences and buildings on certain lands for advertising purposes was considered by the Supreme Court of Illinois, in the case of Willoughby et al. vs Lawrence et al., where it was held that the right conveyed by such an agreement was more than a mere revocable license and was a right of way in gross which a court of equity would protect as an equitable charge on the lands. The court further held that the record of such an instrument would affect subsequent purchaser. and creditors with notice thereof.

CONVEYANCE.—AGREEMENT TO BUILD.—FORFEITURE.—WAIVER.—The owner of certain land, wishing to develop it by building, executes a conveyance of it to a builder, taking from the latter a covenant to build upon the land, the owner making advances for that purpose upon the condition that in case the buildings were not completed by a specified time the property would be forfeited, and the owner might re-enter and take possession. The builder did not complete the buildings by the date fixed, but the owner nevertheless went on making advances, and afterward entered upon and took possession of the land. The right of the owner to do this was disputed by the other creditors of the builder, and their contention has been sustained by the English Court of Appeals, which holds (Platt *vs.* Parker) that by continuing to make advances after the builder's default the owner had waived the forfeiture.

What Others Say.

TO MAKE THE BEST BUTTER.—To produce the best butter every condition must be the best, but Mr. Gould, writing for the Press, is convinced that the average quality of the butter product could be greatly improved if heed were given to four definite rules.

First. Arrange to have some fresh milkers at every season. If the cows all come in about the same time, after a few months the entire yield loses its new milk virtue at once, and the butter is not possessed of that delicate aroma and "grain" that made it a luxury earlier in the season.

Second. Churn often, especially in the Summer. In open-pan setting the cream is usually acid enough when removed from the milk to put into the churn at once. Special

ly is this the case when the cream is allowed to remain upon the milk until the latter is thick; the heat and air having promoted ripening, the cream is at its best estate. By no means let cream remain u churned until bitter water or lactic acid whey forms in the bottom of the cream jars.

Third. Churn as cool as possible (the cream does not need to be over 58° in the Summer), and churn in revolving churns. The action of churning is not to "smash and gather," but by a more gentle agitation to collect the serum of the cream together, and leave the butter fats free to unite. The bad behavior of cream in the Summer may, as a rule, be traced to over-sour cream or too violent beating in the churn, or both.

Fourth. Save the grain. The best butter is that which has had the least done for it all the way through. The aim now of the butter maker should be to avoid the salvey, greasy condition of store butter, which has had all grain and life and flavor washed out of it in the churn or mashed out of it in subsequent working over. Many fail just here. The object is to get solid grains of butter, and this is secured with cold water and salt. When the buttermilk shows, the churn should be stopped and a gallon of cold water and an ounce of salt be added for each supposed six or seven pounds of butter. This hardens the globules, and the salt, in the form of weak brine, takes the place of the buttermilk as a coating or film to the globules. If we agitate the mass slightly, and then let it stand a few moments, the butter grains will all rise above the surface of the fluid. If the buttermilk and brine are drawn out from beneath, without disturbing the butter above, then more weak brine added, we free the butter from buttermilk, and have not disturbed or injured the grain. Now add the salt to this very wet butter. Let it stand for the salt to dissolve and work over at once. Then *pack away from the air*, and we get very nearly perfect butter in August.

CHANGES IN PREPARING FLAX.—The simultaneous introduction of a new process for steeping and a new machine for preparing flax will probably cause a great increase in the cultivation of the crop in England as well as in Ireland. Mr. Henly, a gentleman who was formerly an owner of large flax works in the south of England, has patented a new process of steeping, very much simpler and cheaper than the old process, superseding altogether the use of steam for heating the water in the pits He intends shortly to introduce his system in the United States, in which he has resided during a considerable portion of his life. At present he is starting a company n London to work his patent, chiefly by charging a yearly sum for its use. The new machine for preparing flax is a French one, just brought to Ireland. It allows of almost completely dispensing with skilled labor, and is said to do its work splendidly. The makers will not supply one for under $1,000 and they say they cannot make the machines fast enough.

AGRICULTURE IN IRELAND.—The full text of the Irish Agricultural Statistics for 1885 came out at the end of July. They give a very encouraging presentment of Irish agriculture. There is an increase in the area of land under cultivated crops, as compared with that of 1884, to the extent of 84,383 acres, pasture being decreased by 95,756 acres. There are increased areas of 18,922 acres under flax and 72,281 acres under "meadow" (grass for hay) and clover and decreases of 4,716 acres under cereals and pulse crops and 2,104 acres under green crops (chiefly roots). There are also increases in all classes of live stock except pigs. Poultry, asses and goats are included in the statistics, as well as horses, mules, cattle and sheep. The yield of crops in Ireland in 1885 was highly satisfactory, but prices were low. The fact is that the soil and climate of Ireland, on the whole are not surpassed for general farming, arable and pastural together by those of any country in the world.

SPICE.

WESTERN farmers may learn at least one thing from Eastern farmers. It's to cut and stack the corn as soon as it is ripe—"ripe," that is the word. Prof. Sanborn of Missouri has done good work in forcibly pointing out to the farmers of his State that the corn fodder wasted by allowing the corn to stand in the hill until it is as dry as parchment, is enough to winter the stock.....

"WHY," remarked a Western man to the Editor of the Live-Stock Journal, "many Western farmers raise enough to make an Eastern farmer rich." .....

THE facts regarding the wastes of our Western farmers are indeed startling. The products of the soil, in many parts, are so abundant and low that they seem hardly worth saving. But, as the Journal says, the time is near, very near at hand when all these wastes *will have to be stopped*. Hard times like the present are efficient teachers of economy. ....

THE R. N.-Y., which was the first journal seriously and persistently to press upon the farming public the necessity of frowning upon the sale of intoxicating liquors at agricultural fairs, has now many supporters among the better class of journals throughout the country. The National Live Stock Journal says that experience has proven that there is no benefit in the sale of spirituous liquors on the grounds of our agricultural fairs, while the evils resulting therefrom are legion.....

IN the category of spirituous liquors must be included not only whisky and brandy, but even wine and beer. Any beverage that contains alcohol; any drink that, while it quenches thirst, overheats bad blood and furnishes the rowdy, either individually or collectively, with the fire that rouses into activity the uglier elements of human nature, should be absolutely prohibited, even though such prohibition is attended by a loss of revenue to the several associations ....

BETTER late than never. Now let all good journals join us in our opposition to horse-racing at agricultural fairs, and we may hope that these exhibitions may accomplish unmixed good..... .....

MR. STEWART thinks that three pecks of seed-wheat drilled in are equal to six pecks sown broadcast, and it is equally true that the excess of the yield of a 10-acre drilled crop over a broadcast one may very easily pay the whole cost of a drill each year.....

NEITHER delude yourself nor allow your wife to delude herself that an outing at this season will not do you both good, says the Orange Co. Farmer.....

PATRONS of agriculture will note the disrepancy between the prizes offered for a horse that will trot in less than 2.20, and a cow that is a credit to her breeder, remarks the same journal. The races get more money prizes than all the rest of the show, and they ruin the usefulness of the society which gives them..... ... .

AN examination of high-class butter offered for sale, says the Cultivator, shows that those specimens made by the centrifugal process are soft during the heated term, even when kept in refrigerators that harden the lumps of butter made in the ordinary way. We are convinced that the choicest butter cannot be produced where the milk or cream is subject to such violent motion as it receives in the centrifugal machine..... ..... .

CHICKENS never worry about their crops, says Puck. A good enough joke were it not that the chickens' crops are often bound.....

THE following table from the Milling World shows the prices of certain farm products in 1816 and 1886:

	1816	1886.
Wheat, per bushel	$0 .44	$0 .99
Oats, " "	.15	.41
Corn, " "	.20	.46
Barley, " "	.25	.80
Butter, " pound	.12	.32
Cheese, " "	.6	.10
Eggs, " dozen	.5	.12
Cows, " head	15 00	50.00
Hay, " ton	5.00	17.00
Straw, " "	4.00	14.00
Sheep, " head	.75	2.00
Farm labor, per month	8.00	15.00

THE Times says that oleomargarine is now a legalized product, and butter makers have a fair race and a clear course before them to keep ahead of it. If they are beaten it is their own fault ....

VICK'S Magazine says that sulphide of potash has proved all that has been claimed for it by the English press as a destroyer of mildew on roses, chrysanthemums, and some other greenhouse plants. A quarter of an ounce dissolved in a gallon of water and thrown on the affected foliage with a fine-rosed syringe will wholly destroy the fungus, and the leaves will not be injured..... .....

SELECT your seed corn by marking the plants which please you best.....

SOME of the most successful dairymen in the great prairie States are strong advocates of feeding cows more or less in the Summer on crops cut and carried to them in their stalls, says Ed. Cheever in the New England Farmer. They find that they can keep double the stock that farmers usually keep who pasture exclusively... .....

THEY also learn that there is a great saving of manure, and of fencing too, if the system is extensively adopted. They learn, too, that their cows give a more uniform flow through the season and retain their flesh better. Their cows are never starved in a dry period, nor bloated when the feed is over-luxuriant, nor are they pestered by flies as when running in the pastures in hot weather..... .....

THIS of course presumes that ample preparation is made for a succession of field crops through the entire Summer, and good comfortable stables, sheds or yards for the cows to eat and lie in.....

MR. CHEEVER has never been an advocate of indiscriminate full soiling, but would recommend such a system for each farmer as will best fit his own particular case. If one has a good pasture it would certainly be the hight of folly not to use it, and if one has pasture land that is too rocky to cultivate it should be kept in pasture or wood permanently.....

THE ELM LEAF BEETLE. Fig. 347. (See page 577.)

Everywhere.

TRANSCONTINENTAL LETTERS.-LXIII

MARY-WAGER FISHER.

The Petaluma and Santa Rosa Valleys; Petaluma; Sonoma County; a servant's gossip; a new mode of grafting.

ON March 16 we set out for our trip into the Petaluma and Santa Rosa Valleys, on the line of the San Francisco and Northern Pacific R. R., which extends as far north as Cloverdale—84½ miles from San Francisco. One leaves San Francisco by ferry to Tiburon, then by rail to San Rafael, where the road diverges from the Coast road, but keeps much the general trend of that route. The country through which it passes, however, is of quite a different character—one of the most beautiful valleys I have seen in the State, and lying in Sonoma County, which is very well known as being one of the best counties, and its taxes are lower than those of any county in the State—about $1.30 on the $100. The county has a population of 30,000, and about 400,000 acres of bottom and valley lands. In none of these valleys is there public land of any value to be taken up; but there is much unimproved land which can be bought at from $10 to $50 the acre. Improved farms are held at figures varying from $80 to $400, possibly even higher. The car we rode in was the first one I have noticed as having been made in the State—at Donahue, a manufacturing place on the Petaluma Creek, which is rather an estuary at that point, and navigable from Petaluma to the San Francisco Bay, a distance of 30 miles. At Santa Rosa, 35 miles north of Petaluma, there is a divide, the streams running into the sea, and this divide defines the boundary of the two valleys, the part from Santa Rosa to Cloverdale, the terminus of the road, being the finest. The entire valley is very new, the White and Black Oak groves in it being about 150 years old, and a man in the car said that Sir Francis Drake sailed up it as far as Cloverdale.

From Tiburon to San Rafael, nine miles, the country is deeply rolling, a billowy country, and we passed through four tunnels of considerable length. Great bunches of mistletoe—a dark green parasitic growth, flourishing as if grafted on the trees, sometimes three to four feet in diameter—green moss and the dull green moss or lichen depending from the branches, gave the oaks a very picturesque appearance. The valley is from eight to fifteen miles in width. Petaluma has a population of 4,000, and is quite a shipping point. It is a noted market also for Norman horses, and for its live-stock fairs. It is a pretty town—less so than Santa Rosa—but I doubt if there is an ugly town in California. The instinct for beautiful surroundings is universal—well kept grass, trees, flowers, and buildings in excellent repair. Sonoma County ranks next to Marin (pronounced *Marree*) for its dairy product, and next to that are its vineyards. The people seem to have gone daft in regard to grape-culture. One wonders what they are to do with so many grapes. One of the tributary valleys, 25 miles long and called Sonoma, has 7,000 acres in vines. The soil is volcanic and especially fitted for the growth of light-red wine grapes. In Petaluma there is much dairying and grazing. The fences are of boards or rails; the farm buildings of a most attractive character, many of them charming villas; and the whole country, improved and unimproved land, lay like a garden on that leafing, blossoming spring day.

On the first day we went as far as Santa Rosa, where we stopped for the night, finding an excellent hotel: but it was too cool for us to sit in our parlor without a fire, and I asked the chambermaid to build one. She was past middle-age, a good looking, large-eared, Scotch-Irish woman, and as she sat on the floor, piling the wood on and waiting to see if it would burn all right, she began to talk about "back East," saying she was from Philadelphia. When I told her that was my home, she became especially voluble, and declared that it was "the nicest and cleanest place in the world." "I always told the people here," she went on, "that the houses there were kept as clane on the outside as they are inside here, and, Oh! it's very different living at service here where there's no rale ladies and gentlemen as there is there. Everybody here came here poor and to make money, and it is just like workin' for another servant who has more money than has you. They may be good and kind, but they ain't your born ladies and gentlemen. Why, I lived sixteen years in a banker's family in Philadelphia, and it was like home to me. Such a lovely home, it was always a pleasure to go through it and dust and clane it. I came out here because my brothers and my sister came, and now I would go back, but my sister is buried here, and I can't lave her grave behind me. But, they do say that all the nice, clane Quakers have left Philadelphia," and she seemed glad to have me assure her such was not the case.

On the following morning a heavy rain was falling, which, however, had the grace to stop in time to give me an hour for walking about town, pretty all over with some very beautiful cottages, a $100,000 court-house, a fine public hall and in the hotel there were gas and water pipes. The hotel, like many another on this coast, was so constructed that the main stairway to the second floor opened directly from the office and smoking room, so that the halls and corridors were filled with the smell of the abominable cigar. Oleander and palm trees flourish in the open air, but the acacias that were past bloom in Oakland, were here just beginning to show their yellow beauty.

Anaximander paddled out in the rain to accept the invitation of a nurseryman to visit his nursery, which he found of unusual interest. The nurseryman, a New Englander, with clear-cut, attractive features, had nearly a million seedling roses. He also exhibited a method of grafting in vogue here, which is different from any we have seen in the East, and worth knowing about. An apple-seed is planted, and when the young sapling is one year old it is dug up, and the tap-root is cut off to within about two inches from where the top begins; the top is then cut off and budded, and the doubly shorn little tree is planted; this makes one tree. The remainder of the tap-root is then cut into two or three lengths, according to its size and length, and on to these pieces of root is grafted a cutting, both root and twig being cut off aslant, with a slanting gash in each, then pressed together, waxed and planted in the ground with one bud above the surface. In this way one apple seed produces from three to four trees. The population of Santa Rosa is placed at 6,000.

RURAL SPECIAL REPORTS.

Illinois.

ROCKFORD, Winnebago Co., Aug. 16.—We have had no rain to lay the dust since May 20.

Rye was a heavy crop. Winter wheat good, but little sown. Oats are being thrashed, and are much better hereabouts than was expected. Mine weighed out about 60 bushels per acre. Corn is suffering badly. Many pieces will not be worth husking. Potatoes a very short crop; rain would injure them by causing them to sprout, being so nearly matured. Apples a light crop of inferior quality. Oats are selling at 29 cents; rye, 50 cents; potatoes, 75 cents to $1. Garden truck of all kinds high. Everybody feeding cattle either hay or green corn. S. H.

Indiana.

INDIANAPOLIS, Marion Co., Aug 18.—Reports relating to the corn crop received here continue to support the view that Indiana will gather more than 100,000,000 bushels this Fall. Last year the crop amounted to 132,000,000 bushels; in 1884 it was 105,000,000, and in 1883 96,000,000. "It is too early to guess what it will be this year," said Secretary Heron, of the Agricultural Board, this morning; "but all reports are favorable to a great crop, except from a few northern counties, where the rain did not fall early enough to benefit the growing fields." Manager Henderson, of the Indianapolis, Bloomington and Western Road, has just returned from a trip over his lines, and he gives it as his view that the corn yield will be as great in Indiana and Ohio, or nearly so, this year as last. In Illinois there are some fields which the drought has badly damaged. M. L.

Maryland.

WESTOVER, Somerset Co., Aug. 14.—Wheat and oats are about all thrashed, and much of both is marketed; prices low; wheat from 60 cents to 90 cents in the Baltimore market. Tomatoes are about done. The price has dropped too low for shipment. Muskmelons are being shipped at fair prices. Some of our farmers are plowing wheat land. D. C. S.

Montana.

FORT BENTON, Choteau Co., Aug. 17.—Great prairie fires have lately been raging in this section. The whole country north of the Missouri is said to be burned, with only now and then a small oasis in the blackened waste. On the south side of the river, and in the Little Rockies and Bear's Paw, great damage has been done. The ranges below the Musselshell and in the Red Water country will be almost wholly destroyed. On Wednesday three or four fires were raging in the vicinity of Fort Assiniboine, and every available man of the post was out fighting them. A fire in Bear's Paw threatened the destruction of the timber cut for the post, but after a hard fight it was saved. The driver of the Helena coach reports that a fire between the Lakes and Twenty-eight Mile Spring has destroyed much of the valuable portion of that range. As far as the eye could see was a black expanse of burned and devastated country. Much more damage is feared unless rain comes soon. M. R.

New York.

UTICA, Oneida Co., Aug 23.—BUTTER—Sales yesterday were 150 packages with really fine quality in good demand and bringing from 18 to 20 cents readily, mostly the latter price. The lesser grades are not so salable and bring anywhere from 16 cents up. On the Board there were 80 packages bought at 20 cents of prime butter. At Little Falls 20 packages sold at 19 to 20 cents. The market is firm and promises a trifle easier movement. CHEESE—The New York market decline has had its effect. Other sales on the Board this week were smaller by 3,000 boxes nearly, and half-a-cent lower. Notwithstanding, the sales were quick, and there was but little holding back, although salesmen are inclined to believe in a higher turn. Sales were: 130 boxes at 8 cents; 5,005 boxes at 8¼ cents; 808 boxes at 8⅜ cents; 1,206 boxes at 8½ cents; 1,982 boxes at 8⅝ cents; 733 boxes at 8¾ cents; 150 boxes at 8⅞ cents; 90 boxes at private terms, and 486 boxes on commision; total, 10,590 boxes, ruling price 8¼ cents. The sales at Little Falls were 6,560 boxes at 8¼ cents. HOPS—There is still no market and the situation has not materially changed. The poles are black, with here and there a few green tops showing, and they are covered with lice. The few yards that have survived in any kind of condition will prove a bonanza. There is a conviction that the situation has not been overdrawn and that brewers will have to pay large prices. The State Board of Health will need to make another beer adulteration examination if the the foreign crops are short or prices stringent in the West. There is no activity here, only waiting. No sales have been reported in this market. R. H.

Ohio.

PORTAGE Co., Aug. 14.—The drought here is terrible. Wheat and oats not over one-third of a crop. Corn and hay the same. Potatoes very small in general. C. S.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

AN AILING MARE.

C. C. Warrenton, N. C.—A mare, though a hearty eater, is all out of sorts. She gets ten large ears of corn and all the fodder she will eat three times a day, yet she is poor all the time and has "growling" of the bowels. About a year ago a piece of wood cut a gash about three inches long around the upper part of the left hind pastern joint. This injury caused not only a swelling all round the joint, but the whole leg to the hock joint became swollen. When not worked hard she seems all right; but hard work, like fast driving, makes her weak in the leg. At times it swells up and breaks out at the sore, emitting a great deal of pus, which is often quite lumpy, and after a while the swelling goes down and the wound heals over. What is the matter?

ANSWERED BY F. L. KILBORN.

Judging from the very brief and incomplete description, the present condition of the mare may be due to any one of several causes. To enable us to give a very satisfactory answer it will be necessary for us to know the following points: The age of the mare. The condition of her teeth. Are they all sound and perfect, with none overgrown or displaced so as to cut and injure the gums? Is the food well chewed and swallowed without difficulty? Is there any unnatural odor to the breath or from the opened mouth? How long after feeding do the "growlings" occur, or do they occur at all times of the day or only before feeding? Are there any symptoms of intestinal worms, as their passage with the dung; the passage of mucus with the feces, or a rugged ring of dried mucus around the anus; rubbing of the tail near the root; occasionally elevating the upper lip and rubbing against any cool object within reach? Are the bowels and kidneys regular and apparently normal? Any nasal discharge or cough?

HOW TO PROPAGATE THE SHAFFER.

A Reader, Charlevoix, Mich.—How should the Shaffer Raspberry be propagated?

ANS.—When we first began to propagate the Shaffer we often failed. We have found that with us it must be layered *very early*. We layer ours before the berries are all picked—say July 15th; then we are sure of the tips taking root. We plow, re-plow, and cultivate between the rows until the ground is in fine condition; then open a furrow close to the row on each side. Two boys, one on each side, bend down the tall branches and hold the tips in place, pointing down, well spread out until covered by a stronger person with a shovel. All other raspberry tips are put in with a garden trowel. With us the Shaffer grows so high and so upright it is difficult to reach up and put it in in that way, and then the spring of the canes is apt to draw out the tips. If covered when piled in bunches by careless boys the tips will rot, but never when properly spread.

WEAKNESS IN THE HIND-QUARTERS OF PIGS.

J. T., Numa, Kan.—A five-months'-old pig has nearly lost the use of its hind legs. It began to grow weak there a month ago, and has kept on getting worse all the time, until now it can't walk or stand alone. When held up on its feet it trembles, and falls over when unsupported. It eats and drinks in a hearty way. What is the matter?

ANS.—Weakness in the hind legs of pigs is due to several causes. It is often caused by worms in the kidneys. Then the pigs drag their hind-quarters. As a remedy give a tablespoonful of turpentine diluted with milk. One or two doses a day for two days will be enough. Sometimes the weakness is caused by founder, generally due to eating too much corn. In such cases change the food to wheat middlings or oatmeal. Immersion in water, as hot as the animal can bear, will help. Keep it in for 20 to 30 minutes, and then rub it well, especially on the legs. Keep the head out of the water. A tablespoonful of sulphur should be mixed with its food daily for a week, and it should have all the charcoal it will eat. Weakness in the back and hind legs is also sometimes caused by inflammation of the spinal membrane, which produces a nervous weakness or partial paralysis. In such a case apply turpentine or mustard paste to the loins, and give a tablespoonful of linseed oil.

FERTILIZER QUERIES.

G. M. W., Port Stanley, Can.—1. Will ground bone, dried blood and muriate of potash make a complete fertilizer for wheat? 2. What is the probable cost per pound of each? 3. In what proportion should they be mixed? 4. How much should be sown to the acre, on land that was manured for corn, followed by barley this season? Soil a sandy loam well under drained.

ANS.—1. Yes. 2. The prices vary according to the grade. It is best to estimate the cost by the per cent. of plant food. For instance, if bone contains 20 per cent. of phosphoric acid, we should have 20 pounds to the hundred or 400 to the ton, which at seven cents the pound would make it worth $28. Then raw bone would contain several per cent. of nitrogen. If it contained two per cent. this would give 40 pounds to the ton, which at 17 cents the pound would make $6.80. Add this to $28 and we have the value per ton, viz: $34.80. In the same way we may estimate the value of blood and potash. Potash as muriate is worth about 4¼ cents at wholesale; the nitrogen of blood 17 cents. 3. For wheat three per cent nitrogen, 12 per cent. phosphoic acid and three per cent. of potash. 4. It is impossible for us to say how much should be used per acre, since our friend does not state whether the land is rich or poor or how much manure was used for corn. According to the fertility of the soil we should use from 400 to 1000 pounds per acre.

ROT IN TOMATOES.

O. H. B., Hutchison, Ky.—What causes tomatoes to rot upon the vines before maturing, and is there any way to prevent it?

ANS.—The rot is caused by a fungus, more prevalent in some than in other seasons, and more partial to some than to other varieties—the Acme for instance. The tomato worm also causes rot. These worms are easily found by their copious droppings, and destroyed. We have never heard of any remedy for the rot caused by fungi.

Miscellaneous.

F. M. V., Stockton, N. Y.—1. What is a description of the old Meshannock Potato? 2. How far apart should different varieties of corn be planted to avoid danger of mixing?

ANS.—1. The Mercer, Chenango and Meshannock are the same. The tubers average of fair size, are longer than broad, somewhat flattened. Eyes sunken. Color purple and white. Flesh often purple in parts. The quality is dry and good. It was once thought to be the best potato in cultivation. It is now "run out," liable to decay, etc. It is an early variety, as we remember. 2. Half a mile at least.

A. K. S., Richmond, Va.—Who makes caponizing instruments? When the work is skilfully done and proper attention given, does it pay?

ANS.—W. H. Wigmore, 107 So. 8th Street, Philadelphia, Pa. It not only lessens the time of maturity and increases the weight of the fowl, but it also improves the quality of the flesh. Capons sell for about one-third more than ordinary fowls. The practice of caponizing is cruel, however, and we do not recommend it on that account.

F. C., Leominster, Mass.—1. What are the best varieties of small fruits for home market in this section? 2. Should the shad-bush and evergreens be transplanted this Fall or next Spring?

ANS.—1. The first question has already been answered. 2. The shad-bush may be transplanted this Fall or next Spring, as preferred. The evergreens should be transplanted next Spring.

H. G., Hamburg, Conn.—If I can't get wood ashes for an asparagus bed, what form of potash would be the best to apply and how much per acre should be used?

ANS.—Kainit would be our choice. Use two bags to the acre—four if you can afford it. We should also use raw bone flour, two bags (400 pounds) to the acre.

F. C. W., Columbus, Ohio.—On page 500 in "Brevities," you say you like other wheat, better than the Diehl-Mediterranean for the Rural Farm. What varieties and why?

ANS.—For our light soil we prefer either Surprise, Fultzo-Clawson or Armstrong (Landreth).

W. C. J., Newark, Md.—A party has been taking orders hereabouts for a new strawberry—the Western Union—at $8 per 100. He says it is two weeks earlier than the Wilson and an enormous cropper. Is this story true?

ANS.—This is the first time we have heard of it.

F. B. G., Ypsilanti, Mich.—From Michigan we have heard several favorable reports as to the Diehl-Mediterranean. The Landreth and Martin's Amber are hardy and productive. Prof. Lazenby's late wheat report may help you. (Ohio Ex. Station, Columbus.) Probably D. M. Ferry & Co., of Detroit can supply them. We learn through Dr. Greenleaf who sold the firm seed raised from the Rural seed, that Samuel Wilson, Mechanicsville, Bucks Co., Pa. has the Surprise Wheat for sale. We should like to have our friend sow it in a small way.

E. C., No address.—1. No experiments or even trustworthy estimates have been made of the "average milk yield" of Jerseys, Devons and Ayrshires. The comparative yields would be, however, in the order Ayrshire, Jersey and Devon; but there is so much variation in the cows themselves and their conditions that it would be little more than guesswork to figure up an average yield for either breed. 2. Nothing is sold at this office except the RURAL NEW-YORKER.

J. M. B., Quebec, Can.—The potato you inquire about is the Harlequin, which was sent out years ago. Its foliage is variegated with yellow the same as the leaf you send. There are several other variegated varieties which have been tested at the Rural Grounds and reported upon in these columns. The variegated foliage is pretty and odd—that is all that can be said in their favor.

E. M. C., Embar, Wyo. T.—The flowers tied with a thread are Vaccaria vulgaris—Cornherb. It is a European annual which is becoming naturalized here. The loose heads are the Corn-cockle—Agrosteumma Githago. E. R. C. is entitled to the 50 cents.

J. H. A., New York City.—For information about the Elm Tree Beetle, see article in the Entomological department of this issue.

DISCUSSION.

SLUG-SHOT ON CABBAGE.

W. B., DAYTON, OHIO, in answer to the RURAL'S inquiry as to the safety of Slug-shot when used on cabbage: I consider it entirely safe and effective as a worm destroyer. In my neighborhood there are twenty or thirty persons who use it, and I have yet to hear of the first instance of harm caused by it. Immediately after applying the powder, we often cut the cabbage and use it for the table without the least mistrust, and have for the last three years so used it. It is also put on currants and gooseberries, and I would sooner eat a pie made from berries on which Slug-shot had been than one from those which the detestable worm had made its resting place.

Several instances can be given in this neighborhood of poisoning from the use of Paris-green on cabbage, and no one of good mental capacity ought to ever think of using such a deadly poison on anything intended for the stomach. I cannot see why the RURAL takes such exceptionally strong grounds against Slug-shot. It certainly has never given it a fair and impartial test.

R. N-Y.—We have never given it any test at all. We have never taken strong grounds against it further than to say that if any form of arsenic is the property poisonous to insect life, all who use it should know the fact.

L. E. B., LINCOLN, NEB.—In the RURAL of August 7, W. G. B., Monominee, Mich., asks why his hardy Russian apples are dying. You answer that you think it is due to late and rapid growth and consequent winter injury. This can hardly be possible for he says: "Many of the limbs of last year's growth, which are loaded with fruit"—they were alive this last Spring and set fruit—"are dead, and a good deal of this year's growth seems entirely dead." This Summer's growth could not have been injured by the last Winter.

The Central Russia apples will have no trouble in enduring an average Minnesota Winter. So far as tried, cions which have been top-worked and so forced into rapid and late growth show little or no winter injury. I think more probably the injury to the trees is due to blight, a trouble easily known from winter injury in that it affects and kills "this year's growth."

T. H. ROOD, PERRY, N. Y.—W. A. S., in the RURAL of August 14, asks where he can find Surprise Wheat. I raised 50 bushels this year; shall sow 25 or 30 bushels; the balance I will sell for $1 75 per bushel.

PETER E. HARVEY & BROS., COLUMBUS, N. J.—We have about 40 bushels of Surprise Wheat to sell at $1.50 per bushel. In 1882 we sowed 50 grains, received in the Free Seed Distribution. I suppose we have over 100 bushels.

32 PAGES.

NEXT week we issue a supplement of 16 pages, or 32 pages in all.

IT is impossible to open an English agricultural paper of the present time without finding an editorial on "Saved by Hope." English agriculture has about struck bottom, and all that keeps many farmers up is the hope that the times will change and that prices will improve so that farming will be once more profitable. The worst of it is that farmers have little besides hope to tempt them to look for better times. Competition is close, no new markets are apparent, and many of the old ones are changing. Truly the English farmers have reason to feel doubtful. Still hope is a better anchor than doubt. It is better to believe that good times are probable than to settle down to the conviction that nothing can improve. There have been depressions in agriculture before, yet farmers have lived happily and contentedly through them. The point to be held in mind is that the habits of economy that poor crops or low prices have forced upon us must not be entirely dropped when the times once begin to improve.

THERE is some talk of urging Congress to appoint a committee to investigate the condition of the Agricultural Colleges of the country. These colleges were established through an act of the General Government appropriating certain lands, the proceeds from the sale of which were to go to the support of the institutions. It is claimed that a thorough investigation would reveal the fact that the conditions accompanying this gift have never, except in the case of some half dozen colleges, been complied with, and the money has been clearly misappropriated. Such an investigation might work good results. There is certainly no reason in the world why thousands of dollars should be given to an institution for the express purpose of aiding agriculture and the mechanic arts, and then have the money spent for a totally different object. Why not stir up these colleges and find out just what they are doing. If they cannot increase in usefulness, cannot attract students and gain in dignity, why should they exist at all? There is no economy in paying out this sum every year in order that a few professors may draw comfortable salaries. It will be of more profit to the State to pay the entire expenses of the dozen or more students at an agricultural college like those of Massachusetts, Michigan, Kansas or Mississippi, and close up the home concern, if things are going to drag along in the future as they have in the past. On the whole, we hope Congress will take the matter up.

SOME THINGS THE FARMERS WANT.

THERE has just been a representative gathering of the farmers of the Northwest at St. Paul. In a set of lucid, definite resolutions they left no doubt of the things they need in the way of legislation. Of these, four at least are of national importance. They want the national oleomargarine law strictly enforced. A number of States have passed stringent laws in regard to this matter; but in not one of them have they been efficiently carried out. Now that the national authorities have the supervision of the manufacture and sale of the product, it should be much easier for the State authorities to enforce every provision of the State laws; and in those States which now have oleomargarine laws, not a pound of the concoction should be sold in contravention of the State or national laws. It is not now a question of whether the law is good or bad; it is on the statute book, and should be enforced.

They want Congress to appropriate $3,000,000 "to stamp out contagious diseases among domestic animals." When Congress appropriated $150,000 the other day for this purpose, what a cry of extravagance rose from some agricultural "authorities," and how bitterly they must denounce the assembled farmers of the Northwest for their outrageously unreasonable demands! The amount asked, however, is not a tithe of the losses inflicted on the nation every year by contagious diseases among our live stock.

They want speculation in food stuffs stopped as far as possible by the passage of State laws prohibiting gambling in the form of dealing in "futures." The injury done to American agriculture by this sort of speculation is a serious matter, not only to the farmers of the country, but to every class in it. The unscrupulous men who engage in this form of gambling have not only disorganized our home markets, but lost us a good deal of our foreign trade in agricultural products, by unduly raising prices here beyond what foreigners would pay; by creating abroad distrust of American fair-dealing; and by inducing purchasing foreign countries to seek elsewhere for their supplies, and thus stimulating production among our rivals. They are the leeches who add nothing to the wealth of the nation, but prey alike on producers and consumers. If legislation could suppress them, they should be suppressed at once.

They want a Secretary of Agriculture, with a seat in the Cabinet. We do not remember any large assemblage of farmers in any part of the country at which a resolution of this kind has failed to receive hearty indorsement. A considerable number of prominent agricultural writers, however, can see no advantage in such an elevation of the chief representative of the agriculture of the nation. It will not make spring wheat yield fifty bushels to the acre in Minnesota, or be as effective a remedy against the curculio as a flock of hens in a New England plum-patch. The farmers of the country, however, would undoubtedly be pleased with the measure; and the farmers of the country can, if they please, undoubtedly enforce their wishes in the matter.

MORE IMMIGRANTS.

IT looks as though England is approaching the limit of her population that can live happily upon her soil. There are, to be sure, countries more densely populated. In portions of China and Japan people are crowded so closely that an English garden would seem like a stock farm to them. No Englishman would care to live as the Japanese live. John Bull needs more room, and if he cannot get it at home he must seek it elsewhere. England, without Wales, contains 50,922 square miles. In 1881 she had a population of 24,608,391, or 480 to the square mile. Massachusetts seems crowded to us, yet she has but 228 persons per square mile. New York has 108, and New England 60. The surplus population of England must go somewhere, and it will come here if allowed to do so. It may go to Canada, and thus help to realize Beaconsfield's dream of an English wheat supply; but with the present state of Canada such an emigration is not to be expected. The Government of Mexico has made strong efforts to induce colonies to go to that country. These efforts will not be much of a success. Emigration is almost sure to follow distinct lines of latitude. The history of the attempted French colony in Paraguay shows how difficult it is to acclimate colonists in a warm country. In 1880 we had in this country 2,772,169 persons who were natives of Great Britain and Ireland. More than half of these were located in New York, New England and Pennsylvania. It is time to seriously consider this question of emigration. We have welcomed the world to our doors. Is it not about time to modify that welcome? Uncle Sam is no longer "rich enough to give us all a farm." The old gentleman should not injure himself by his gifts outside the family.

HELP NEEDED FOR THE SUPREME COURT.

THERE are now before the United States Supreme Court, on appeal from the United States Circuit and District Courts, several important patent cases in which the farmers of the country are interested. There are before the same august, but slow-moving body, a large number of other cases in which important private and public interests are involved. Prompt decision in such matters is of great public and private importance; but prompt decisions are impossible as the court is at present constituted, owing to its dilatory mode of work and the over-loaded condition of its docket. When it convened last October there were 851 cases on the docket. During the term 489 cases were added, while the court disposed of only 440. Thus after eight months' steady work the court adjourned with 49 cases more on its docket than it began with. Next Fall it will meet with a good three years' work before it, and the arrearage is increasing all the time. Isn't it a shame that suitors appealing to the highest tribunal in the land must wait three years for a hearing, however great an injustice may be caused by the delay? The people of the country are now paying unduly high prices for a large number of articles on account of the royalty exacted from the manufacturers by the owners of patents which the court will certainly declare invalid when it gets to them. Neither the royalties nor the excess of prices paid on account of them are recoverable, even though the court should declare the patents to have been worthless from the outset. The late Judge David Davis matured an admirable scheme for the relief of the court, and the Senate passed it twice; but the House on both occasions treated it with the neglect which it has of late accorded to many important measures originated in the other branch. This flagrant dereliction of duty should not be repeated. The interests of the country as well as common justice and decency demand a speedy decision in cases involving great public and private interests, and it is chiefly such cases that are appealed to the Supreme Court. Early in the next session, Congress should relieve this body from some of the burden of business which each succeeding term shows it cannot carry, and this is a good time for electors to remind their Representatives of the necessity for prompt action.

GRAIN BUYERS' ASSOCIATIONS.

WHILE fairly conducted associations of grain buyers may be of considerable advantage to the farmers of the section in which they operate, by securing lower storage and transportation rates and sharing the consequent advantages with their customers, such organizations guided by selfish and unscrupulous principles are a curse to the country they oppress. Such for years was the Millers' Association to the Northwest. For ten years this organization practically controlled the prices of wheat in the greater part of Minnesota and Dakota and greatly influenced them in adjoining sections. The agents at Minneapolis fixed the prices for buyers along every line of railroad tributary to that place, and telegraphed them every day to its agents operating among the farmers. Most of the large elevator companies were controlled by the Association and were compelled to stick to the prices made. The railroad companies which were interested in the scheme, gave the Association a rebate which gave it a great advantage over any outside buyer who might be rash enough to compete with it. Thus the farmers were compelled to sell their grain at the figures fixed by this "giant monopoly." Last year a new grain law promised relief to the farmers by allowing anybody and everybody to build warehouses and elevators where they pleased, and a multitude of small, independent elevators came into sharp competition with the large elevator companies. The Millers' Association in struggling against this competition incurred considerable loss, while the farmers, for the first time in a decade, enjoyed the benefits of fair competition among the buyers.

This year the Millers' Association will not keep its buyers in the field as formerly, but it expects to exercise influence on prices through a new association of buyers organized early this month, and including all the leading grain buyers in Minnesota and Dakota. Over 200 of these from all sections met at Minneapolis the other day, and bound themselves by ironclad rules to adhere to certain prices for grain, and pay no more. The plan adopted was that of the Iowa Grain Dealers' Association, which for four years has fixed the prices for grain in that State on the basis of the Chicago market, less the freight from the point of shipment to that market, and a liberal allowance of three cents per bushel for margins. The railroads allow a rebate of two cents per 100 pounds to the members of the association. This compels all buyers to join the organization, for outsiders not getting this rebate, could not compete with members. Recent legislation in Minnesota is very stringent in prohibiting such oppressive organizations, and the State Railroad and Warehouse Commissioners, whose duty it is to see to the enforcement of the law, are closely watching the new association; but the members declare they have no intention of breaking the laws. If the law passed for that very object does not protect the farmer, however, it is likely he will find in the Grain Buyers' Association as oppressive a monopoly as he ever found in the Millers' Association.

BREVITIES.

ARE our criminal laws designed to protect honest men or malefactors?

Now cut out the old canes of the blackberry and raspberry bushes; cultivate the soil.

WE have fifty or more chrysanthemums grown from seed started not till March. The plants are as thrifty as possible, and will, no doubt, give a great variety of flowers later.

WE asked a good old doctor last week to name the best treatise on health. He took a piece of paper and wrote, "Keep your head cool, your feet warm and your bowels open." What do you think of it, friends? Doesn't that state about all there is to it?

IN agricultural practice, as in other things, authorities sometimes differ. In this issue friend Waldo F. Brown advocates the plowing under of the entire clover crop; in last issue friend Henry Stewart insisted that it is more economical to cut the crop for hay and plow under only the roots and stubble.

MARKET gardeners tell us that sweet corn sells to better advantage this year than any other vegetable. Much of the corn about here has been badly injured by worms, and the price for good ears has held up well. Eating corn is about like eating cash for the market gardener. Tomatoes, beans, potatoes and apples are slow

THAT was a lively meeting of florists in Philadelphia the other day; and owing to the rapid advance in their business the florists of this country ought to be a merry set when, once a year, they come together to talk over experiences and profits. Forty years ago, Brother Henderson tells us, the sales of cut flowers in New York City at New Year's amounted to less than $250. Last New Year's the sales reached $100,000, while over $3,000,000 were paid for cut flowers here during the past year. Doubtless the increase in other places was just as great, so the 8,000 florists in the country have good cause to be merry. An increased love of flowers is a sure sign of an increase in refinement in any community. What better proof of this truth can we have than that women, who excel men in refinement the world over, have a far stronger love than men for floral beauties.

WEDNESDAY last the Secretary of the Illinois State Board of Agriculture sent warrants for $100 apiece to the treasurers of 37 agricultural societies in the State on account of the fairs held in 1885. Thirty-one other societies received similar warrants last month, making 68 societies in all entitled to this bounty. The last General Assembly made these appropriations for county and other agricultural fairs; but provided that no warrant should be drawn until the President and Secretary of each society had filed affidavits with the State Board of Agriculture that no wheel of fortune or any other gambling device was licensed or allowed on the fair grounds. This proviso is good as far as it goes: but betting on horse races or trots, as well as licensing or tolerating the sale of intoxicants should have also been prohibited.

THE farmers of Michigan may well congratulate themselves. They are making solid progress towards political recognition. If they do not secure the rights that any political party can bestow upon them, it will be their own fault. Hon. C. G. Luce has just been nominated for Governor by the Republicans. The nomination was unanimous and hearty. Mr. Luce is a farmer. As Master of the Michigan State Grange he has labored for years for the best interests of the farm. He is a sound, honest, out-spoken man—as near to the ideal farmers' candidate as we can well imagine. Farmers to the front every time say we. Whenever the opportunity offers it is the duty of farmers to show their power. What better chance will the farmers of Michigan ever have than the present? Here is a chance to place a man from their own ranks in the highest office in the State. Do it, say we, and prove that it can be done.

THE National Butterine and Oleomargarine Association, representing 25 manufacturers, 16 of whom were present, met at Chicago Wednesday, and after a good deal of grumbling and carping at the new law, decided not to test its validity in the courts. If the grocers and jobbers refuse to pay the tax imposed for selling the stuff, the manufacturers threaten to sell direct to the consumers. If they do pay the tax, $48 and $480 respectively, then the manufacturers will do their utmost to have the tax lightened. Here is a threat and a promise to the underlings; what will the effect be? Some people grumble that the price of butter hasn't gone up with a jump since the passage of the law. Pshaw! It won't go into effect before November 1, and as the results of it are a trifle doubtful, there's little disposition to discount them in advance; but there is certainly an upward movement.

THE latest advices with regard to European crops show that the harvest is short everywhere except in Russia and Roumania and the stock of cereals on hand in the former country is very low. In France the wheat crop will be 40,000,000 bushels less than last year. The shortage is about proportionally as great in other continental countries, and in nearly all other crops also there is a considerable shortage. The Indian wheat crop is also shorter than hitherto reported. There is therefore a fair prospect of remunerative prices for American wheat for those farmers who can hold on to it. In venturing such predictions there is always much reluctance, because no one knows all the circumstances which would decide even legitimate trade, and speculators can always upset the most reasonable inferences. If one could foretell with certainty the course of the market even for the next two months, there would be "millions in it."

Horseman.

THE PERCHERON HORSE SHOW.

WE give, at Fig. 350, a correct illustration of the building erected for the exhibitiou of the American Percheron Horse-Breeders' Association to be held at Chicago in connection with the Illinois State Fair, September 6—11. The building is 700 feet in length, and is one of the grandest exhibition buildings ever erected.

We are informed that nearly three hundred pure-bred Percherons will be exhibited by about fifty breeders of the United States and Canada; and that a display of several hundred grade Percherous in harness will be made, showing the different purposes for which their breeders claim superiority over all other breeds of horses, thus giving the farmers and stock-breeders of the country an opportunity to see in large numbers the kind of horses that meet ready sale at the most remunerative prices. The State Agricultural Society and the Percheron Association are together offering about $7,000 in prizes, and a large number of gold, silver and bronze medals for Percheron horses.

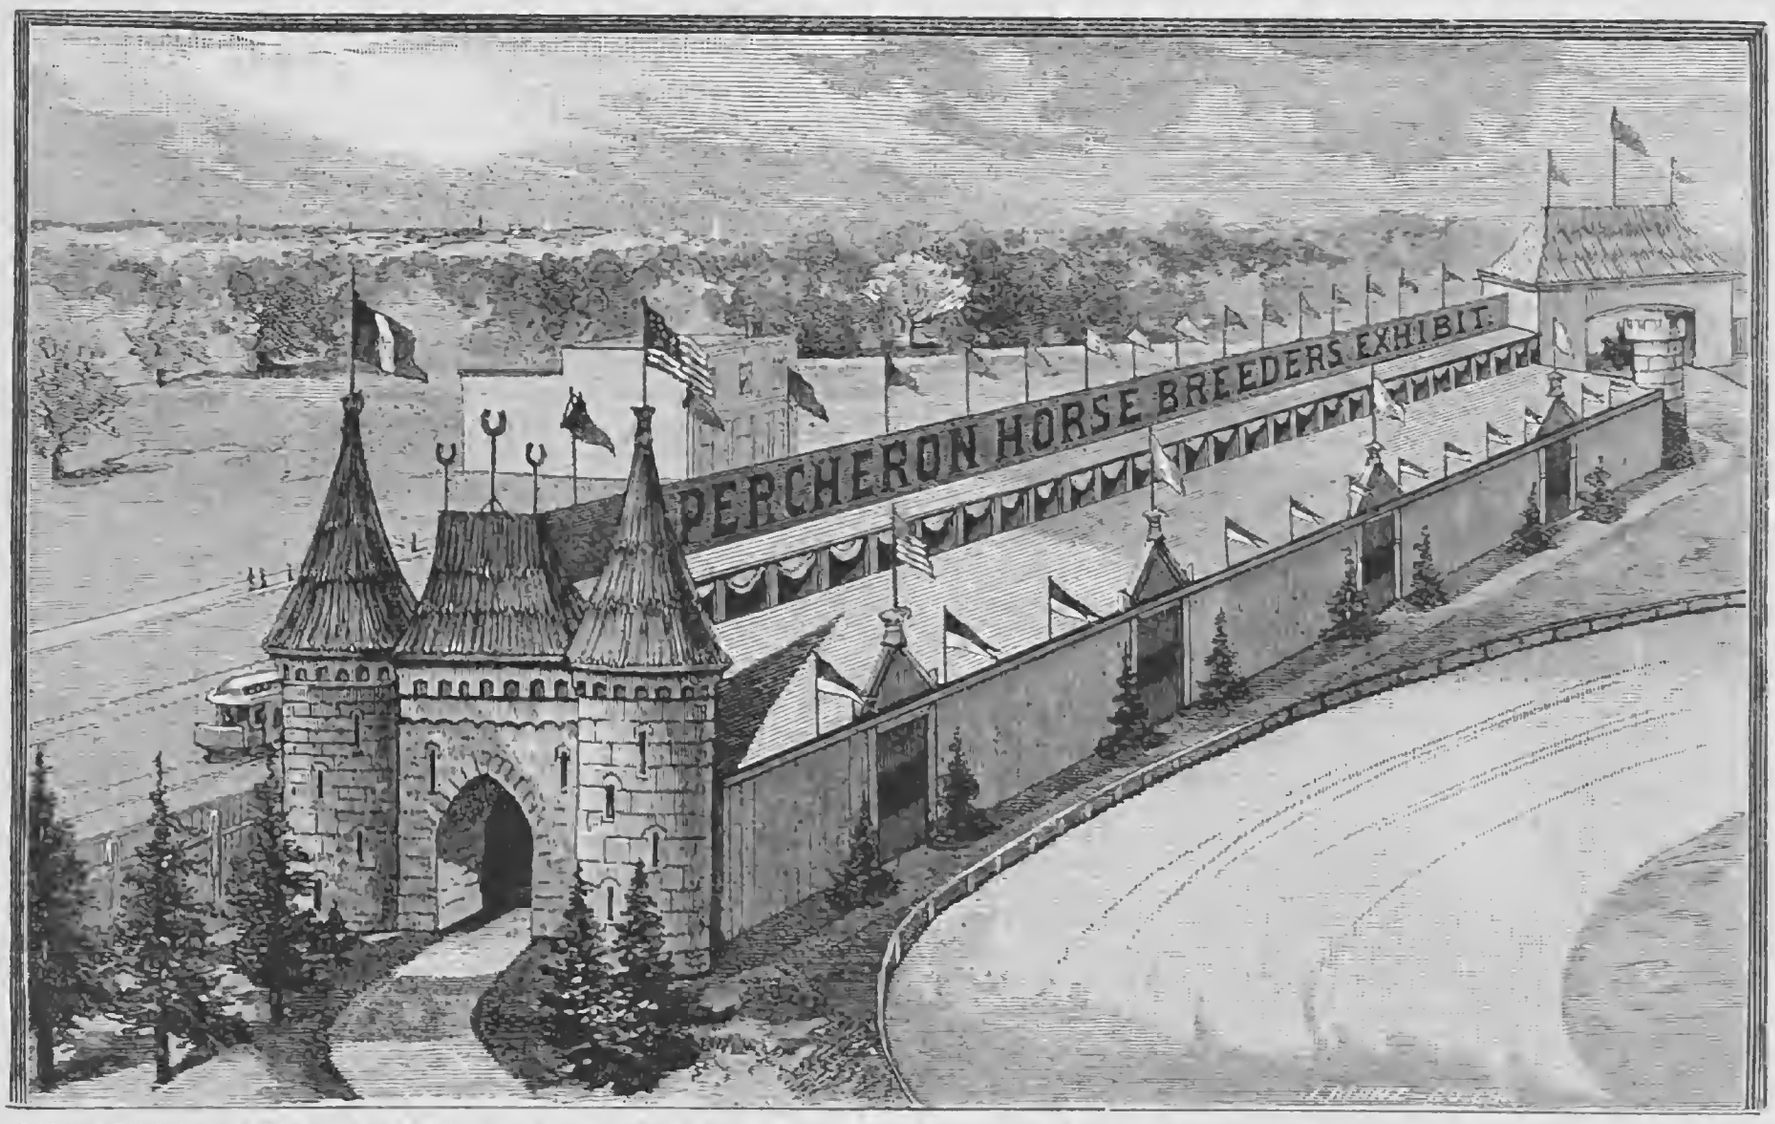
The jury of awards has beeu appointed by the highest official representatives of agriculture in three great nations, the Minister of Agriculture of France having appointed Marquis de la Motte Rogne, Inspector General of the National Studs; Commissiouer Colmau having appointed the Hon. George B. Loring, ex-Commissioner of Agriculture, and the Minister of Agriculture of Canada having appointed Prof. Andrew Smith, President of the College of Veterinary Surgery at Toronto.

In view of the great iuterest now taken in the Percheron breed in all parts of the world it seems probable that the coming exhibition will be the most successful meeting of draft horses ever held.

Other breeds of horses will also be there in great force. The managers offer premiums as follows:

For roadsters, $500, divided into four premiums, $50, $25, $15 and $10, for best stallion four years old or over, best stallion three years old and under four, best mare four years old and over, best mare three years old and under four, best pair of mares any age, best mare any age, best pair geldings any age, and best gelding any age. For Thoroughbreds, $400 is offered, divided as above. In the class for saddle horses, $300 is offered, divided into four premiums each, for best stallion any age, best gelding any age, and best mare any age. A class is made for carriage or coach horses, other than Cleveland Bay, for which $400 is offered, divided into four premiums each for best stallion any age, best pair geldings, best mare auy age, and best pair mares. For the best park horse, stallion, mare or gelding, any age, $100 is offered, divided into four premiums. There are$ 250 offered, divided into first, second and third premiums, $25, $15 and $10 for best boy rider, under 14 years, best gentleman rider, best girl rider under 14 years, best lady rider, and best lady rider with escort. For best boy driver not over 14 years, and best girl driver not over 14 years, $50 each is offered in three premiums, divided as above, the horse to be driven to cart, and to be under 14 hands high. For best pony stallion any age, best pony mare any age, and best pony gelding any age, $50 each is offered, divided into three premiums, the ponies to be not over 12 hands high.

The Cleveland Bay, Percheron, French Draft, Clydesdale and English Shire Associations each contribute $500, to be awarded in classes, divided into first, second, third and fourth premiums—$50, $25, $15 and $10—for best stallion four years old or over, best stallion three and under four, best mare four years old or over, best mare three and under four, and best pair of mares any age. There will also be $400 offered in the grade draft class (get of pure-bred sires), divided as above, for best gelding any age, best pair geldings any age, best mare any age, and best pair mares any age.



BUILDING ESPECIALLY ERECTED FOR PERCHERON HORSE EXHIBIT AT ILLINOIS STATE FAIR, CHICAGO, SEPT. 6-11.
Fig. 350.

IN FAVOR OF MEDIUM-SIZED HORSES.

I CONSIDER 3,000 pounds of horseflesh enough for most of our farms. It is better to have this divided into three horses than into two. It will cost but little more to feed three 1,100-pound horses than it will to feed two weighing 1,500-pounds each. It will not cost much more to shoe three smaller horses than it will to shoe two larger ones. Smaller horses will work barefooted better and will hold their shoes longer. In planting time it is handy to divide the team and keep both harrow and marker going. The cultivator can run many a forenoon while the team is mowing. The third horse can pull the hay-fork and rake the hay. I want a farm horse weighing 1,100 pounds. He should be short-legged and of a quiet dispositiou. A rather low-spirited horse, as a rule, is better for the farm. He is more easily kept, is safer for hired men and boys, will bear a change of drivers every day if need be; he is safer for women to drive and less liable to injure himself. Where three are kept they should be alike in disposition and movement so that any two can be worked together. L. G.

Crawford Co., Pa.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

BUCHER, GIBBS & CO., Canton, O.—An illustrated circular of the Imperial Sulky Plow. These plows are made of wrought and malleable iron. The sulky is adjustable to any hand plow (right or left) or it is furnished complete with a chilled or steel plow with or without handles. The steel or wood beam sulky (complete) has a three-horse evener, rolling cutter, neck-yoke and plow. There is no need of a power lift. One great advantage of the Imperial over any other sulky, it is claimed, is that the boys, girls, or aged men can do the plowing. The plow is counterbalanced by the weight of the operater, the seat being adjustable so as to equalize any difference in the weight of the driver and plow. The plow is clamped to the bail, so that it swings horizontally or vertically on the bar, thus avoiding obstacles. It is guaranteed that this sulky is easier on the team, while carrying the driver, than the same plow detached and in use. The advantages are well set forth in the circular which, with the illustrations and instructions will make everything very clear. Our friends should send for it.

WINE FROM DRIED FRUITS.

WHEN the phylloxera first devastated the French vineyards, the imports of raisins and currants into France amounted to only 6,000 to 7,000 tons a year; for the last three years the imports of both these dried fruits have averaged 65,000 tons—an increase of nearly 60,000 tons in seven years. And, remember, these imports of dried fruit represent no less than 270,000 tons of fresh fruit. The vine-growers, learning that wine was made from these imports, complained to the Government, and the Minister of Agriculture has just reported the results of the investigation ordered.

The preparation of the wine according to this report, is simple. The dried fruit is put into a vat with water at a temperature of 68 degrees Fahrenheit, there being 55 gallons of water to every 100 pounds of fruit. At times a small quantity of sugar is added, in order to assist fermentation, which as a rule soon occurs and generally continues for a week or two. At the end of this period the water is drawn off and the wine is made. As a rule it is of a very pale color. When highly-colored wine is required it is mixed usually with the very darkest Spanish wine. These wines, when made, contain from 7 to 10 per cent. of alcohol, but they have very little tannin and do not keep long.

The greater part of the supply of fruit is obtained from Greece and Turkey. Of currants alone France imported the last two years 80,000 tons. The demand from this quarter has greatly enhanced the price. The production has not increased, remaining almost stationary. While the imports into the United States decreased from 12,500 tons in 1883 to 7,400 tons last year, those of France increased from 20,200 tons to 48,000 tons for the same period. The fruit from the Ionian Islands is most desirable, because in curing it is allowed to remain upon the tree until dried, the stem being twisted in order to prevent the sap from ascending.

GAPES IN CHICKS.

GAPES in young chicks seems to remain the great obstacle to success in the poultry-yard. I have not had a single case of gapes during the last five years, and I attribute it to the fact that after the first two days the chicks get no soft feed, at least no wet corn-meal at any time. At first a soft custard of milk and egg is fed, and after that dry, cracked corn. I know very little as to the cause of gapes, and have never raised chickens extensively, but I do know that previous to the exclusion of soft, wet meal in the feed to young chicks every one hatched got the gapes, and many died with it. Now I lose none by the disease. The philosophy of this I cheerfully leave to others. H. H.

"GOING BACK" ON WHITE LEGHORNS.

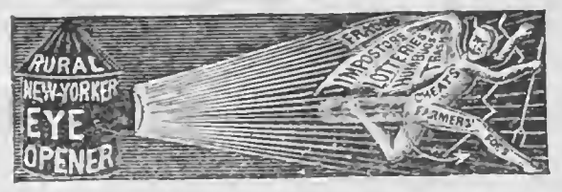
I HAVE pinned my faith to White Leghorns heretofore. Their eggs sell well, and the hens seem to be all eggs. I figure that some of my hens have laid five times their weight of eggs during the past year. This year I have had bad luck with my chickens. Just about 85 per cent. of them are roosters. A White Leghorn rooster is about the most unprofitable bird I ever tried to raise. I wish now I had a larger breed. B. C. C.

Ionia Co., Mich.

FLAVOR OF CARP.

THE flavor of carp depends entirely upon the food given them. That is an old saying, but it is as true now as ever. I can take a chicken and feed it on food that will make the flesh too rank to eat. I have taken carp and fed them upon corn meal six weeks before eating them, and cooked them so that good judges who were prejudiced against them declared them equal to any fish they ever tasted.

Philadelphia, Pa. M. P. P.



Here is a verbatim copy of a confidential letter which was sent to a friend of ours in Michigan, from whom we received it this morning:

NEW YORK CITY.

"DEAR SIR: My confidential traveling man, who was recently in your section of the country, writes me that he thinks you would be a good man to do business with in your State. He says that from the good reputation you have among those who know you, that you would not willingly betray a confidence that had been placed in you, whether my propositious were satisfactory to you or not. Now, to be plain, I have goods that were printed from plates that were secured from the Treasury Department of the United States. They cannot be told from genuine until they have worked their way back to the Treasury for redemption. By that time, as you well know, they have worked their way through hundreds of hands. They are ones, twos, fives, tens and twenties. When you reply to this I will give you full instructions how to get into the business, showing you how to make money safely, quickly and easily. I will explain to you as a sensible, intelligent man that you do not run the slightest danger. Write your name and address on a separate piece of paper."

Inclosed, on a separate piece of paper, was the address of the swindler, or rather the place to which letters are to be directed to him.

This is a specimen of the invitatious sent out to would-be dupes by the saw-dust swindlers, who, in spite of repeated exposures, are still finding a multitude of dupes all over the country who deserve to be cheated for attempting to get counterfeit greenbacks with which to swindle their neighbors. The fraud has been fully exposed a dozen times in this Department by the E.-O.

The repeated publication of officia statements from our diplomatic representatives in England concerning the enormous "unclaimed estates," by means of which many a swindler makes a living in this country, seems to have convinced these speculators that estates must be manufactured in some other European country for credulous American "heirs." Their attention has been turned to Holland. Numerous "heirs" have been writing to our Minister at The Hague, Mr. Bell, for information about the great fortunes to which they think they are entitled, and he tells one applicant that these inquiries convince him "that a systematic fraud has been, and still is being, practiced by scheming sharpers who make a living by keeping alive and warm the excitement about the existence of unclaimed estates in Holland for Americans." Those who have been led to believe that money awaits them there should know that all unclaimed estates in Holland that came into existence before 1857 are now the property of the State and are beyond the reach of claimants.

TO SEVERAL INQUIRERS.—We have never tried the Common Sense Evaporator, made at Newark, Ohio; but from what we hear of it, it seems to be a humbug. So we judge, is the "Fruit and Vegetable Growers' Association" which commends it through its "Secretary," W. Orlando Smith. Indeed the only reason for the existence of the humbug association seems to be to indorse the humbug evaporator.....We do not recommend the National Alliance, a newly started mutual life insurance concern of this city. It may turn out all right; but better wait and see.....We do not place much faith in the merits of galvanic batteries of any sort; but those made by the World Manufacturing Company are as good as any.....Whatever the price may be, a cheap gun is generally a poor investment.

Woman's Work.

CONDUCTED BY EMILY L. TAPLIN.

DAISIES ON THE FARM.

She painted them on canvas
With a rapt, artistic air,
She wore them in her bodice,
And in her raven hair.
She thought farm life idyllic,
And said its greatest charm
Was lent it by the daisies,
The daisies on the farm.

"Do you not love the daisies?"
To the farmer's son she saith,
But all the praise he uttered
Was underneath his breath.
It sounded energetic,
But she felt a vague alarm
That he did not love the daisies,
The daisies on the farm.

She read to him a poem,
A pastoral complete;
He seemed unsympathetic,
Though her voice was very sweet.
With some repressed emotion
His face grew dark and warm,
For its burden was the daisies,
The daisies on the farm.

Soon the charming summer boarder
To her city home returned.
For a soul of higher longing
Her æsthetic nature yearned.
And the farmer's son, undaunted,
With his scythe upon his arm
Went to battle with the daisies,
The daisies on the farm.

—*From Texas Siftings.*

OF INTEREST TO WOMEN.

The London Queen describing novelties in fancy-work, says that fancy canvas scarfs are used now for decorating chair backs, by being cut and joined to the required length, with the ends resting on the back, and with a large bow of Surah silk tied round the middle, placed on the top of the chair. Sometimes one end is of Surah, and the other of canvas, with the two materials twisted up together to form the bow. These scarfs are also cut out and arranged as lamp shades, over a wire framework, with a ribbon tied round, near the top, and finished off in a bow; a frill of lace stands up above. Muslin window curtains are tied back with the scarfs, with one end turned over the other, and hanging below it. Birdcages are also surrounded by them, so that there are several ways of utilizing what is a bygone fashion for dress, and will not be worn next Summer.

The same authority states that pretty square toilet pincushions, brush covers, glove and handkerchief sachets can be made with small squares of plush, satin or silk, an inch and a quarter, joined together by the points. The square is cut out in card-board and then neatly covered in the ordinary patchwork way; the card-board is not withdrawn, and should be quite hidden. For an ordinary-sized pincushion sixteen squares will be required in four rows of four, all joined together, with a pearl at each join. The cushion would measure seven inches square, and be of satin edged with lace, with a small bow of ribbon matching the squares, or little tassels of pearls at each corner. A grey satin cushion with cream-colored lace and squares of ruby plush looks handsome, or a white satin with yellow, pale blue, or pink, according to the color of the toilet table drapery. The sachets are made in exactly the same way, only have silk cord instead of lace. Cushions for chairs, and sofas have squares measuring about three inches, of one or more colors. This is novel, effective, and a capital way of using up even the smallest scraps. In making articles for bazaars or presents, one always has small cuttings, which appear too insignificant to do anything with, but these will all come in for this work.

Chair backs worked in the four corners and gathered up with a bow of silk cord and tassels in the middle, are of recent introduction. The cord matches the color of the embroidery and one end hangs down lower than the other, from the top of the back of the chair. Two corners fall over the back and two over the front. Russian cross-stitch is more usual for the working of the corners, or a small appliqué design. Perforated colored cloth, for cross-stitch, is excellent, and can be had adapted for slippers, cushions and valances. For a knitter, the new Penelope knitting cases are charming little gifts; they fold up like a letter-case, and have straps containing nine sets of knitting-needles, all numbered. Sets of plush table napkin rings, each of a different color, or two of each, have been recently sold at bazaars, or given as presents. They are either made over a piece of stiff buckram, one and one-half to two inches wide, lined with sarsenet or satin, and neatly joined together, and made to look as if they buttoned over, by two good-sized beads as buttons, and two rings of little beads as loops; or else they are drawn over a piece of rope, carefully joined, and finished off with a tie and bow of satin ribbon over the join. Plush d'oyleys are not unheard of, but they are only used for "very best," and have been known to have a real flower and spray of maiden-hair pinned to one side by a pearl-headed pin. Violin bow covers in plush or satin are sometimes made by skillful fingers, as a present to some great friend of musical ability. They require a length of 30 inches and width of five inches. The piece is first lined with tolerably stiff brown paper, and then with satin or some other material. If anyone is wishing to make one, the best pattern is a brown paper cover from a musical instrument shop, such as is usually sold with the bow.

OLD-FASHIONED GIRLS.

We don't mean dowdies, careless in dress and ungraceful in manner. Nor the hard-featured, raw-boned young woman, who, to the public eye, bears the mark of spinster foreordained on her uncompromising brow. We mean girls after the type of Miss Alcott's Polly, brightest and best of old-fashioned girls. Our old-fashioned girl is often pretty—very pretty, in a demure, somewhat Quakerish style. Even if her features are not beautiful she has a look of placid intelligence and gentle sweetness that brings her more than half-way towards actual beauty. Her features are merely the screen through which her clear and radiant soul transmits its light. Herein lies the secret of her attractiveness; it is all the difference between mere dollish prettiness and spiritual beauty.

The old-fashioned girl affects a trim simplicity of dress. She wears softly falling brown frocks, with a knot of scarlet at the throat, making her look like a benevolent Robin redbreast; or soft dark silk—we may notice particularly that her silk gowns never have the aggressive rustle we notice in others. Or she robes herself in bright muslins fresh as her own true heart, that set off her modest face as costly silk and satin never could.

The old-fashioned girl is not an exclusive product of country districts, as is often supposed. There are some quiet, half-forgotten nooks even in busy New York where, like the heroine of our nursery rhyme, "she makes music wherever she goes." She may be a school teacher or daily governess, or earn her daily bread and butter in any of the thousand and one employments open to women, or she may be the busy vestal of some domestic shrine, the mainspring of the household machinery. In either case she is the same bright helpful spirit—

> "A creature not too bright and good
> For daily use and daily food."

What, then, is her peculiar charm—the trait distinguishing her above all the fair "rose-garden of girls?" Rather a difficult matter this to reduce an impalpable charm to cruel prose.

Miss Alcott's Polly, we may remember, is noticeable for her cheery helpfulness and patient unselfishness. Perhaps this is the secret, after all. The determinations to help others will always help us ourselves, and the unselfishness that enters into all the hopes of others smoothes many rough places for our own feet. "In love preferring one another." The gentle, gracious mind, self-abnegating spirit and cheery heart, these are the crowning gifts of the old-fashioned girl we try to paint—none the less a heroine in that her victories are of the mind and heart only.

What if her gentle graces fail to win the love that all women hope some day to possess? Her life is not a failure because she must write herself *femme-sole* to the end of the chapter. She has worked, and planned, and prayed for others—she has crucified self, and such are indeed the very salt of the earth.

So, if these are our old-fashioned girls, like Abou Ben Adhem, may their tribe increase, leavening this careless world with their brave spirits, until claimed by that old, old fashion, Death!

WOMAN'S WORK.

THIRD PAPER.

Again we take up this subject for discourse, because there are hardly two other words that imply so much in our existence as woman's work. In these words there is so much combined for pleasure and profit that much might be said to guide the footsteps of mankind high up beyond the foot-hills of this mountainous journey. For many obstacles might be overcome, that are lying in our pathway, if we but build the ladder on which we rise, and that means to inform ourselves in the best modes and methods to pass through the things that may encumber our pathway each day. And in order to inform ourselves, we should see that we have placed within our reach an abundant supply of good literature. It should be grasped at with more zeal than rubies and precious metal; for if we ponder well on the depths of good and solid reading, we shall have a ship of thoughts deeply freighted with truth and beauty, and its effect has upon us a lasting influence, which cannot easily be effaced by the stroke of time. An intelligent old lady once said: "I can always tell upon entering a household what kind of people they are by seeing the literature they have within their reach." So it is when we come in contact with persons; we can easily tell by their speech as well as their looks the benefit they have derived from good literature. Have you not in reading the interesting articles from Mary Wager-Fisher noticed that she still continues her study and that she associates with those who are of her stamp; those who give her in exchange, words that should never die? When we have fully attended to our mental capacities, we should see about our companions and associates. What are your associates? What company do you keep? What class of people do you love to mingle with? Is it those of a higher nature—those who would have a tendency to elevate you; or is it those that are not your equal, and who seek to destroy that very part of your better nature? As it has been said, "Let your companions be select; let them be such that you can love them for their good qualities, and whose virtues you are desirous to emulate." How much then ought we to impress upon youth the value of good literature and good companions; for out of these springs the source of the finest fountain in youth. Good literature and good companions go hand in hand; wherever you see one you must invariably see the other. The great responsibility concerning the youth's associations, depends largely upon the parents and home surroundings. The parents should lay the foundation of their children's character and when this is carefully done, and the right kind of example set before them from day to day, they will have a love for the things that will elevate them; and have no desire to go backward, to be hurled in some fast-destroying element, to perish by their own misguided footsteps. As you have noticed—a vine will run its course as it is trained; so will a child. Then parents should be very careful in the culture and growth of their children, that they may, when mature, be persons whom you may feel justly proud of, both mentally and morally and who will always be as a shining light at home and abroad. In building or making anew, it pays to furnish the best quality for such uses; and so it is in building up children's characters, it more than repays to furnish them with such material as will help to lay a solid foundation for their future career.

Shakespeare says: "'Tis the mind that makes the body rich," so we should not first be desirous of riches, but seek to develop the mind. Remember a good name is rather to be chosen than great riches. No one can rob you of your good name, but can take from you your wealth. Mothers, be not in a hurry to clothe your daughters in fine silks and costly raiment, better by far clothe their minds with that which is more lasting, and which will ever befit them to live in deeds, not years, in thought, not dress. For by thought miracles have been wrought, and by dress extravagantly displayed riches have soon vanished to poverty and utter destitution.

Cummings said: "Dignity and rank and riches are all corruptible and worthless, but moral character has an immortality that no sword-point can destroy, that ever walks the world and leaves a lasting influence behind." Every one leaves behind him influences for good or evil that will never die, and it should be our highest aim and endeavor to sow good seed along our pathway in life, that we may in due time reap our just reward.

MARY D. THOMAS.

GOLDEN GRAINS.

The Christian minister who is satisfied, in any sort, with serving as an echo for the religious ideas of his time, will be a reed shaken by the wind.. ....

The best thing to take people out of their own worries, is to go to work and find out how other folks' worries are getting on.....

Fenelon says: "We dote upon this world as if it were never to have an end, and we neglect the next as if it were never to have a beginning" ....

From Geo. Eliot's Adam Bede: "If a man does bits 'o jobs out o' working hours—builds a oven for's wife to save her from going to the bakehouse, or scrats at his bit o' garden and makes two potatoes grow instead o' one, he's doing more good, an' he's just as near to God, as'f he was running after some preacher an' a-praying an' a-groaning." ....

Dr. Coles says there are but three kinds of animals which generally use tobacco. The rock goat of Africa, whose stench is so insufferable that no other animal can approach it; the tobacco worm, whose intolerable visage gives to every beholder an involuntary shudder; and one other nondescript animal, whose tobacco frothings and spittings defile his own visage, bespatter and bedaub everything within his reach; who besmudges and pollutes the atmosphere with his nauseous fumigations, and whose stygian breath seems to denote approximation to some bottomless pit...

The same objects, seen from three different points of view, the past, the present, the future, often exhibit three different faces to us; like those sign-boards over shop doors which represent the face of a lion as we approach, of a man when we are in front, and of an ass when we have passed.....

Emmons says: "I could never think well of a man's intellectual or moral character if he was habitually unfaithful to his appointments."

In all charity believe that your brother desires to hold only Christ's truth; but do make sure that you hold it yourself, whether he holds it or not. This is the best undenominationalism in the world..... ....

Mrs. Whitney says: "There is never a 'Might-have-been' that touches with a sting, but reveals also to us an inner glimpse of the wide and beautiful 'May-be.' It is all there; somebody else has it now, while we wait."....

In the memoir of Dr. E. N. Kirk, it is recorded that some one asked him how a Christian could best show himself a Christian in society. His reply was: "I always try to put myself in this attitude before leaving home: 'Lord, give me an opportunity to honor thee, and a heart to embrace the opportunity.' This is all our Lord requires.".....

The wise man seeks the cause of his defects in himself, but the fool, avoiding himself, seeks it in all others beside himself..... .....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

HOUSEKEEPING IN CALIFORNIA.—XIV.

MARY WAGER-FISHER.

When in San Francisco, which was not often, we sometimes went on a tour through "Chinatown," which if not sweetly odoriferous, is very picturesque and interesting. The Chinese provision shops are of the most curious character, for what they do not turn to account would be hard to mention. Like the Indians, they dry a great deal of fish and meat. One sees dried fowl's gizzards strung like pepper pods, dried ducks, and the entrails—I take it—of animals no worse than sausage stuffed in the same way. Among the shell fish they dry, is the abelone—each vowel should be pronounced—and as they were the first, I think, to eat it, it is not generally considered a fit food for fastidious palates. But one day a friend said to me that she had eaten it dried and that it tasted very like dried beef, so a few days afterwards, when we were at Monterey driving along the beach, we came upon a Chinese camp where these abelones were drying in the sun, and we bought two. They asked for them five cents a piece. After Anaximander had pared off the outer surface thoroughly, we proceeded to eat, and the general verdict was that if the meat had been salted and then smoked and dried, and had tasted a little less abelonish, we should have liked it. But it was not bad by any means, and a whole abelone will make dried, or fried, a full meal. The shells the fish live in are magnificent, and the Chinese sell them for five cents each. We found some beautiful ones on the beach, where they abound, growing on the rocks, but often washed in while alive.

Another food of the Chinese consists of sprouted seeds. They take evidently any kind of seed that is cheap—beans for example—and sprout them in water. How they cook them I do not know, but they are always to be seen in buckets in their markets. Possibly they are cooked and served something after the manner of spinach and make a dainty dish.

While we were at Monterey, we found ourselves overtaken by hunger in one of our tramps, and so we dropped in at the first restaurant we came to. It was clean and had a sanded floor, the white, fine sand of the beach being well fitted for the purpose. It was the laddie's first sight of such a floor, and I had only seen one once before in an out-of-the-way place in southern Ohio. The waiting maid brought us beefsteak, black beans, bread and butter, coffee and most delicious water. We were hungry enough to relish almost anything and thought the black beans delicious. I concluded that they had been cooked in that excellent way—boiled until tender and then baked 24 hours in a closely covered earthen pipkin buried deep in hot ashes. But I was silly enough to ask how they had been prepared, and the maid said, "boiled until done, then fried in lard, and water added for gravy," a regular mess; but they tasted good, nevertheless. At Monterey there is a place called Pacific Grove, planted with cottages, where families come at all times of the year to rent cottages for a month or more, or put up tents

in summer time. It is one of the most delightful places I ever was in, with no end of natural interest on sea and land. Every year the Methodist conference and the Chatauqua Assembly meet here. I asked the wife of a Methodist preacher how it happened that this was a stated place of meeting for the conference. "It is because of the difficulty of finding in a suitable place elsewhere, sufficient accommodation for so large a body of men. Californians are very inhospitable, and indeed, they do not know in what true hospitality consists. They think that when a preacher enters the house they should put everything in the larder on the table—instead of simply adding another plate, and serving whatever they themselves happen to be eating," and her criticism applies beyond the limits of California. She had been born and reared in Philadelphia, and had lived for a quarter of a century in Oregon and California, but to her mind there was no place like the East.

I asked in regard to the salaries of Methodist preachers here, but her information was rather indefinite. The pastor of the First Methodist Church in Oakland had $2,000 a year. Her own son-in-law, who was a preacher, and had a wife and four children and kept a hired girl, had received during the past half year $187, and she thought to manage with that required very close housekeeping.

There is a great deal of extravagance in California, as elsewhere; poor women ape the dress of the rich and there is constant strain for show, particularly in dress. The women, too, use a great deal of powder and paint on their faces, which give them a disreputable appearance, when they are, it must be supposed, of average respectability—the wives of clerks, tradesmen, artisans and shopkeepers. The leading amusement in society seems to be "progressive euchre," whatever that may mean, although there is a great deal of intellectual pursuit. I commented one day upon the unusual numbers of women with beautiful white hair, and a long-time resident said she thought that hair turned white very early in California.

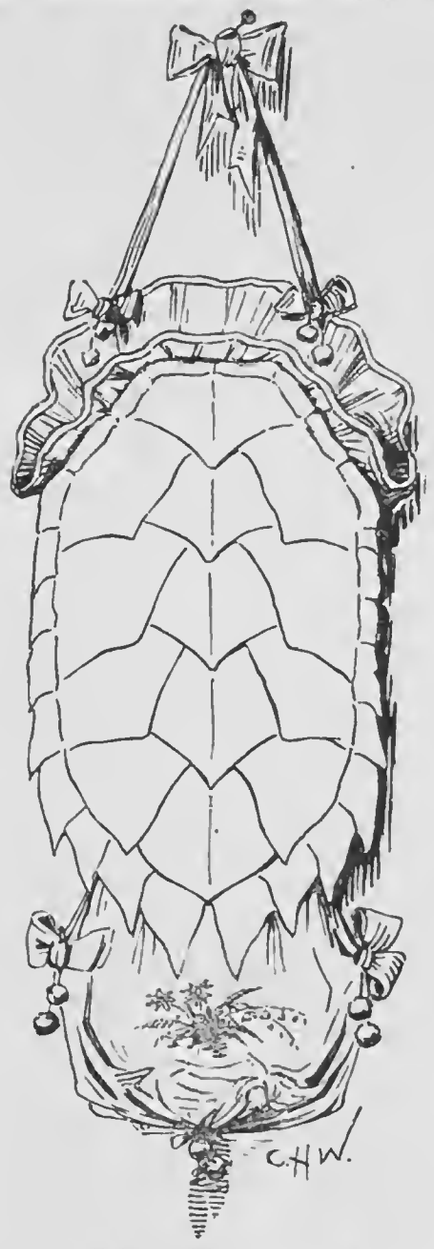
The greatest personal pest in California is the flea. It is no respecter of persons and one never becomes accustomed to it. Fleas infest cushions, carpets and all stuffy places. I never went to church without getting at least two on me. They are not so annoying as I found them in Italy, but they render some women's lives almost wretched here, their dress, being more voluminous than that of men, attract more fleas. Pyrethrum (insect powder) and the leaves of the laurel and of the eucalyptus were claimed as being obnoxious to the fleas, but I never found anything effective but to spy them out with a pair of sharp eyes, reinforced with nimble, murderous fingers. I became so expert as a flea-killer that I rather enjoyed seeing a flea. In the half year we were in California we never encountered bedbugs, and an old resident told me that there was not one in the State. She had lived 12 years in Kansas, where, she said, her house, in spite of all she could do, was constantly infested with them, and after she had moved to California she was so careful to beat and brush and clean every article in her boxes before putting them in her new California house that a physician asked her the cause of her great cleanliness. When she told him that she might have transported a Kansas bedbug he was greatly amused and begged her if she found one to let him have it as a natural curiosity in California. On the last day of March our housekeeping in California came to an end, and we turned our faces, to the wild delight of the laddie, homeward. After the expressman had carried our trunks away I tarried in the flower garden and picked a nosegay of spicy carnations and Banksia roses.

AN ODD WALL-POCKET.

A MANUFACTURER of fancy goods and embroideries has just filled an order for a wall-pocket, which is the most original of all I have yet seen. A captain in the East India trade brought home with him six huge tortoise shells. The backs received a beautiful polish and the under sides of the shells were bronzed. Then they were lined with satin, and the lining was brought out at the top and faced with silk, to form a pretty border at the mouth of the pocket.

The little bag affixed to the bottom is only for ornament. The shell may be trimmed in any color desired; a shade of blue or old gold gives a pleasing effect. It is very difficult to obtain the shells of the tortoise, but an excellent substitute can be found in the smaller shells of the common land or fresh water turtle. After cleaning and drying them carefully they may be polished or not, as desired.

At a recent wedding in this city the bride



AN ODD WALL POCKET.

was presented with one of these unique pockets, containing a huge bouquet of rosebuds just bursting into bloom. C. H. WARREN.

KITCHEN TALKS.

ANNIE L. JACK.

THE alternate waves of heat and cold that we experience this season are very trying to health and strength. The nights become suddenly cool after sunset, and mildew and blight are found everywhere. Grapes that have never before suffered, are covered with the white mold and many varieties of apples are spotted so as to be hardly worth the gathering. Chief among them is the Fameuse, our great staple fall fruit. The orchardist puzzles his brain to discover if there is any way in which we could counteract this dire influence, any condition of soil or treatment that will prevent it. Theories have been advanced, but nothing practical has resulted. What seems strange is that the Dutchess of Oldenburg is free of spot growing side by side with other varieties. It seems to make no difference whether the trees are in the open, or two thickly interlocked. So we say cheerfully—our ship will not come in this year, and "learn to labor and to wait."

Meanwhile in the kitchen are many discussions on Domestic Economy, and the business of the daily cooking; but the putting up the winter supply of fruit goes bravely on. There are so many steps to be taken and the kitchen architect so seldom takes into consideration the weariness such needless walking brings, that I would warn all house builders to see to it that the kitchen possesses all the requisite conveniences for labor-saving, whatever the parlor may have. See to it that there is free ventilation to carry off all the mixed odors of the cooking, and that there is sufficient light to disinfect with that best of all God's blessed sunlight. Let the floor be, if possible, of hard wood that needs a yearly oiling, and regular wiping over, but no scrubbing. Well do I remember all the stiff and sore fingers that came from that cruel abomination home-made lye, used to clean the floor to a pine-board whiteness. It is a woman's martydom to have to depend on such resources for keeping her floors clean. The walls of a kitchen should be painted and varnished, then they would simply need to be wiped down at intervals. The ceiling should be light-colored to give a cheerful appearance to the room. And then, no matter who works therein, there will not be any unpleasant connection with dirt and grease as is too often the case. I like to hear the children of a household after they have left home talk about their mother's kitchen as the pleasantest room in the house. It speaks for itself without any comment. Here the Gourmand breaks in and says he thinks the pantry will remain longest in his memory. Well that is doubtless partly the result of the kitchen work and is always associated with it. Boys especially like to remember the good things they could eat, and it is a pleasure to see a crowd of healthy children actually enjoying their food. Besides, we all know by experience how near the heart is to the stomach, and how a day's work and happiness are influenced by a bad breakfast.

"CANNING FRUIT."

To can fruit nicely is really very little trouble if one only knows exactly how to do it. Weighing both fruit and sugar is, I think, easier than measuring out quart by quart, and greater accuracy is obtained. Half a pound of sugar to a pound of fruit is a good general rule to go by, but raspberries contain so very little acid that for them I do not think quite so much sugar is necessary, so I only put five pounds of sugar to twelve quarts of berries, and in putting up smaller quantities just "spare" the sugar somewhat, using a little judgment in preference to twisting small fractions (which are an abomination any way) upside down in one's head.

I use a large-sized tin pan to cook the fruit in: it will hold about twelve pounds of fruit with five or six pounds of sugar. Instead of using a damp cloth to set the cans on while filling, as so many advise, I set a shallow pan of water on the stove by the side of the pan in which the fruit is cooking, and set two empty cans in it, with the rubbers already on them and the lids within reach.

When putting the fruit on the stove always add a little water, to prevent it from sticking to the bottom. When the berries have come to a boil, skim off the froth and let them cook only five minutes (cook cherries, pears and peaches twenty minutes); then take a quart cup to dip them up with, and pour into the cans through a wide-mouthed funnel. When one can is nearly full set the funnel into the other, and fill the first one right up to the brim with a spoonful or two of fruit. Screw on the lid *immediately*, and with a good-sized, damp cloth lift the can off on to a table; give the lid an extra twist, rub off the sides of the can and set it on its head until cold, as this presses the rubbers tighter than when the cans are set right side up. Be sure to have the fruit boiling when putting it into the cans. When the latter are cold, rub them off again; give the lids another turn and set away in the cellar. I put mine on a hanging shelf, with curtains of coffee-sacking around it, to keep the fruit dark.

In packing fruit to send a distance it is better to use a barrel than a box, for a barrel is generally rolled around while a box is set down k-slap! No matter if it is marked "glass, with care." An apple barrel holds 17 quart cans wrapped in newspaper and swathed in a good handful of hay—each can separately, of course. Put a good thick layer of hay in bottom of barrel, then lay in four cans and pack hay closely between them, then another layer of hay and four more cans, then more hay and now you can put in five cans as the middle of the barrel is larger, then more hay, and four more cans which make the 17. Cram in as much hay as possible and head up the barrel. This last is easier said than done, unless you are an old hand at the business. In the first place, loosen the hoops around the top of the barrel, and next be sure and find out which way the head fits in best, for although the barrel is round you will find it is round with a difference, and that there is just one way and one place to get the head in tight.

CARRIE D. HIGH.

TO WASH CLOTHES WITH A SCRUBBING BRUSH.

Soak the clothes over-night, then, in the morning, soap, put on the washboard and scrub with an ordinary scrubbing brush. You will find that the dirt is removed much easier and quicker than by rubbing with the hands.

THE "COMMON SENSE" MILK PAIL.

PATENTED.

This is the only *perfect* Pail made.—There are no seams in the front to catch the dirt. It has a perfectly fitting strainer, which can be instantly removed, so that every part of the pail may be *quickly* and *thoroughly* cleaned. Extra strainers can be obtained at any time.

The Pail is made from heavy XX tin, and is in all respects the **best in the world.**

Send for special circular. Agents wanted.

MILKING TUBES.

FOR MILKING COWS WITH SORE TEATS.

This is the best Tube in the market. Sent, post paid to any address, on receipt of price. One Tube, 25 cents; Five Tubes, $1.00. Send for special circulars to

BARTLETT & DOW,

LOWELL, MASS.

Please mention this paper.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

News of the Week.

HOME NEWS.

SATURDAY, August 28, 1886.

THE great Minneapolis Exposition was formally opened Monday. Mrs. Cleveland, by touching an electric button connected with the telegraph at Saranac Lake in the Adirondacks, N. Y., set the machinery in the Exposition building in motion. The exposition is a big thing. The building covers seven acres, and cost $300,000, and the show will last six weeks.....The trial of the Chicago anarchists cost over $25,000. The board bill of the jury and two bailiffs for 60 days amounted to $2,541; two extra bailiffs were needed for greater precaution during the last 23½ days, costing $141 for board; total board, $2,682. Their case will be appealed to the Supreme State Court, and to the United States Supreme Court if the decision in the State court is adverse. Owing to the law's glorious delays and uncertainties few, if any, of the miscreants will ever stretch hemp.....Geronimo and his murderous band have again slipped away from their pop-sure American and Mexican would-be captors. Just as the troops of both nations were closing in upon the hostiles, the latter took to the mountain fastnesses. They still "look worn and hungry," however, and "dispirited." Gen. Miles, after six months of failure, is still certain his men will soon capture or kill them. So was Gen. Crook several times before he was superseded.....There's to be a lively triangular fight in Michigan. The Democrats and Greenbackers have clasped hands, the former nominating the candidate for Governor, Treasurer, Land Commissioner and Member of the Board of Education; while the latter fill in all the blanks for Lieutenant-Governor, Auditor-General, Secretary of the State, Superintendent of Instructions and Attorney-General. The fusionists hardly expect to elect their State ticket, but they think they'll gain in the Legislature and be able to elect a U. S. Senator to succeed the present Republican, Conger. The Republicans have nominated an excellent ticket, and the Prohibitionists are ready to "play a lone hand," against all the others.....The anti-rum fight is raging fiercely in Iowa. The rum-inspired murderers of the Rev. Mr Haddock of Sioux City have not yet been arrested. Many druggists have been acting as if they supposed that the Pharmacy Act of last Winter turned over the saloon loafers to them, and have been allowing customers to register applications for liquor under the names of prominent temperance men, and even of Pres. Cleveland, H. W. Beecher, etc. The Pharmacy Commission, however, which has control of the matter, has just secured the conviction of some of the most flagrant offenders and is to make a general onslaught on rum-selling druggists.....During the absence of the Commissioner of Indian Affairs and the Assistant Secretary of the same office, Miss Minnie S. Cook is acting as the head of the Indian Office.....The deficit of Col. Bolton, the late superintendent of second-class matter in the Chicago post-office, now amounts to near $16,000, instead of the $100,000 first claimed. He is still in the County jail. His property so far as discovered amounts to $30,000.....A statement just issued by the Bureau of Statistics gives the total number of immigrants who arrived at the six principal ports during July, 1886, as 31,348, an increase of 3,866 over the number arriving in the same month last year. During the seven months ended July 31, 1886, there arrived 221,313, or 6,610 more than in the corresponding period of 1885..... .....W. J. Kendall, ex-policeman and afterwards private detective at Boston, swam the Whirlpool Rapids of the Niagara River the other day, for a part of a bet made between others. His share is variously said to have been from $1,000 to $3,000. It was in doing this foolhardy feat Webb lost his life.....

..The Prohibitionists have put up a full State ticket in Nebraska, with a woman suffrage plank in their platform....The lists of Congressional nominations from the Western States contain a fair proportion of Prohibitionists..... .....,

..The Washington Territory Democrats assembled at Tacoma re-nominated Charles S. Voorhees as delegate to Congress without opposition. The platform indorses President Cleveland's Administration, demands the repeal of the Burlingame treaty, and a strict enforcement of the Chinese restriction bill, and censures Governor Squire for declaring martial law during the anti-Chinese riots last Winter..... .....

...Hundreds of half-breed Indians who were not captured and punished after the Riel rebellion have been caught between two millstones. They lost no time in retreating to Dakota and attempting to take up government lands. Our Department of the Interior has refused to treat them as anything but Indians, and the consequence is that many of them, unable to procure lands, are once more in the Saskatchewan Valley, where the Dominion authorities say they are not wanted.....Thomas Moonlight, who some years ago called the Democrats of Kansas "rapscallions, the scum and dirt of the Missouri river-bottom," is now Democratic candidate for Governor out there, and the Republicans and Democrats are both mad.....

....John Dougall, founder and editor of the Montreal Witness in 1846 (daily in 1861) and of the New York Witness (daily in 1870, discontinued in 1878, the Weekly being still continued) died at Flushing, L. I., Thursday morning at the age of 78.....

.....Prof. R. S. Woodward, of Washington, says the average yearly rate of the wearing away of Niagara Falls, along the whole contour, has been from 1842 to 1875, 2.44 feet; from 1842 to 1886, 2.42 feet; from 1875 to 1886, 2.38 feet. The time required to recede a mile, at the rate of 2.40 feet a year, is 2,200 years. Buffalo, 20 miles away, feels relieved..... ...The Canal Convention which met at Syracuse, N. Y., this week was the most important meeting held in support of the canals in some time. The general sense of the meeting, as shown in the voting, was overwhelmingly against all plans for enlisting Federal aid for the canals, and the action taken may be regarded as having pledged New York State to care for its great waterways without the intervention of the National Government. Among the resolutions adopted was one recommending the State Legislature at its next session to appropriate $500,000 for the improvements recommended by Horatio Seymour, Jr., chief engineer of the canals. A noteworthy incident of the convention was the electing as president of the Canal Union, of Mr. George C. Clinton, of Buffalo, the grandson of Governor DeWitt Clinton, who contributed most to the building of the Erie .....

Editor Cutting has been released from his Mexican prison, and now from this side of the river is vaporing against the Mexicans and appealing to his "fellow countrymen." He was justly in "quod" for two months during which time he was very well treated, and now he claims $500,000 damages. An editor's time on the Rio Grande must be even more valuable than in New York! He'd probably make more money by exhibiting himself in a dime museum or a circus. To avoid all future embroilment of the kind, an effort is to be made to secure a change of the Mexican laws in so far as they are held to give a right to try Americans in Chihuahua for acts committed in America. The laws of Italy, France and Belgium are the same. Are we to seek an amendment in these also?.....The injury by that hurricane at Galveston last week was greater than expected. The storm extended along the coast and 250 miles inland. All the towns, farm houses, cottages, plantations, crops, etc., in its area were more or less severely injured. Loss estimated at over $5,000,000. Much destitution.....

FOREIGN NEWS.

SATURDAY, August 28, 1886.

THE most startling news of the week, a chapter of romance, an oriental sensation, is the deposition and kidnapping of Prince Alexander of Bulgaria, last Saturday morning in Sofia, the capital of his principality. When the "revolution" was first announced on Sunday morning, it appeared to be a national affair, indorsed by all the leading Bulgarians and hailed with rejoicing by the people at the capital and throughout the country. The abdication appeared certain and voluntary, and all considered the movement a great stroke of Russian diplomacy, much the same in nature as the Russian action at Merv, and in some of her other oriental enterprises. Soon it was known that all the telegraphs were controlled by the revolutionists; that nobody was allowed to leave or enter Bulgaria; that all travel therein was prohibited; and that nothing was known except what the revolutionists wished. Then came contradictory reports; but no doubt soon existed that the army all over Bulgaria and Eastern Roumelia, remained faithful to the Prince who had lately bravely led it to glorious and unexpected victory against the invading Servians. Everywhere the troops declared their loyalty, and the people buzzed with the troops. The "counter-revolution," was successful. The revolutionists were prisoners. All parties shouted for the Prince's return; but where was he? "Shut up in a monastery near Sofia," some reports said. "No, in a Russian monastery," said others. "A prisoner in a Russian fortress." "A prisoner on his way to St. Petersburg, "At liberty and on his road home by way of Odessa," "No, by way of Roumania," "No, by way of Austria," and numerous other rumors came thick and fast during the week. It is only this morning that something like a definite idea can be formed of the "revolution" and "counter-revolution," both triumphant within three days. A handful of Bulgarian conspirators, violent friends and paid agents of Russia, aided by a single regiment, lavishly bribed with Russian gold, and a few hot-headed military and naval cadets, effected the "revolution." The sentinels having been bribed, the leaders entered the palace at two o'clock last Saturday morning, roused the Prince, told him the people, while thankful for his military services, were dissatisfied with his government as not friendly enough with Russia, and demanded his resignation. He absolutely refused—yielded to threats and through disgust say others. Before the city was aroused he was hurried off, surrounded by a band of cavalry, to the nearest point on the Danube; and with one of his brothers put on board a fast little steamer, already prepared, and at once started down the river to the newly acquired Russian province of Bessarabia. Meanwhile the Bulgarian troops and populace rose against the conspirators, imprisoned the leaders, and demanded the return of the Prince, who was still steaming down the river. As the vessel passed Rustchuck and Silistria the people shouted for it to land the Prince, but on it sped. Inquiries, expostulations, threats, and all sorts of negotiations were meanwhile flashing along the wires between all the courts and diplomatists of Europe. Was the deposition of the Prince due to Russian intrigue alone? Did Germany and Austria connive, or would they consent? Was Russia to seize Bulgaria and Roumelia, and Austria appropriate Bosnia and Herzegovina? Were the Turkish troops to enter Roumelia from the south, and the Russian Bulgaria from the north? Was the triple alliance between Germany, Austria, and Russia still intact, or did Russia rely on French aid? Was there to be a grand European war, to close with the expulsion of the Turk from Europe? Was the Russian or Austrian flag to float over Constantinople, or were the confines of Greece to be extended—the Greek Empire revived? The excitement all over Europe far exceeded that produced by the Cutting affair along the Rio Grande. The course of events in Bulgaria surprised all, while delighting some and disappointing others. Where the Pruth joins the Danube stands Reni, the first town the Prince's steamer could reach in Bessarabia. On arriving there orders from the Czar, who had learnt all about the successful counter-revolution, directed that the Prince should be set at liberty, and, entirely ignorant of the course of events in his principality and in the rest of the world, he started for his old home at Darmstadt..... After traveling by rail through Russia, where he received scant courtesy, he arrived at Lemburg, Galicia, Austrian Poland, at two o'clock Thursday afternoon, where he was received enthusiastically by Poles and Germans, and where hundreds of telegrams from royalties, princes, nobles and notabilities awaited him. The Bulgarians want him back; but whether he will return or not will depend on the joint action of the Powers. The Czar indignantly denies he knew anything about the conspiracy. He urges Alexander not to return to Bulgaria, and the Courts of Vienna and Berlin are reported to join in this request or demand. The Turks are massing troops on the south of Roumelia; the Russians are doing the same in Bessarabia, north of Bulgaria. The first shot in a general European war may be fired at any moment; but if Germany, Austria and Russia agree, peace is hardly likely to be disturbed in the near future.....

Foreign news next week ought to be interesting; and shall be full.....

AGRICULTURAL NEWS.

SATURDAY, Aug. 28, 1886.

FARMERS at the East are beginning to complain of the dry weather and to long for rain. The Northwest is also not only suffering from drought, but from an unusually intense hot wave, the thermometer in some places actually reaching 100°. As one of the results of this state of affairs, prairie fires have broken out in Minnesota and threaten serious damage. Rains there would evidently be as welcome as they would be east of the Alleghanies..... Acting Attorney-General Jenks has given an opinion sustaining the right of Land Commissioner Sparks to prosecute timber thieves after they have carried their spoils off the lands .....Prof. Law, of the N. Y. State Board of Health, has inspected over 50 ailing horses near Middletown, N. Y., and found six cases of glanders. The affected animals were all killed and the premises disinfected. About 30 others were quarantined until the symptoms shall take a decided form.....The great English lamb fairs now in progress show a substantial advance in prices. .....Clover in Iowa is suffering from black mold..... The regulations necessary to carry into effect the provisions of the Oleomargarine Bill are completed, and will be ready for publication in a few days.....Frederick A. Berry, grocer, and Joseph Senckermen, dealer in produce, in Chicago, were held Tuesday in $1,000 bail each for trial on a charge of selling oleomargarine under the name of fresh dairy butter.....The design for the oleo stamps is to be simply a bull trampling a serpent under foot in the center, while around the margin are the words: "Oleomargarine" and "Internal Revenue," the denomination of the stamp being indicated in the corners. Three varieties of stamps will be needed, one for retailers, another for wholesalers, and a third for manufacturers.....Much of the cranberry crop of Wisconsin was destroyed by the late forest fires. .....The manufacture of wine from oranges is developing into a very extensive industry in Florida. Wine made from this fruit is said to have formed a large proportion of the "sherry" of commerce since the trouble caused by the phylloxera in France and other wine-producing countries. ....In consequence of the outbreak of pleuro-pneumonia among cattle in quarantine at Quebec, an Order in Council has been passed prohibiting the importation of live cattle from infected counties in England..... ...The Association of Official Agricultural Chemists of the United States has been holding its annual meeting in Washington, at the United States Department of Agriculture, for the past two days. It had under consideration the methods used in the analyses of commercial fertilizers, and has agreed upon those to be employed during the coming year. The scope of the association's labors has been much increased, so as to include the consideration of the analyses of soils, dairy products, cattle foods and other agricultural products.....

Catarrh in Children.

"THE children have used the Compound Oxygen and are very much better; the cough has left them entirely. The little girl is better from the catarrh, but is bad enough yet. At one time it was terrible to be near her, there was such an offensive odor; but she is so much better that she will be able to attend school to-morrow morning. She has been troubled for about three years with nasal catarrh."

This extract from a letter from Joliet, Ill., is an example of many from mothers who find this remedy the most effective aid in restoring and preserving the health of their children. To learn more about this write for a treatise of nearly two hundred pages, sent free to all applicants by Drs. STARKEY & PALEN, 1520 Arch St., Philadelphia, Pa.—*Adv.*

Crops & Markets.

SATURDAY, Aug. 28, 1886.

On Monday last the Mark Lane Express said that "the harvests thus far have been greatly disappointing," although a "spell of dry weather, with hot sunshine," might yet redeem what appears to be a bad harvest." Trade was sluggish in English wheat markets, but home grain was 3c. a bushel dearer and foreign 1½c. to 3c. higher, and the tendency was upward.

A leading English daily thus sums up the European harvests:—"It is now pretty certain that the wheat crops in Western and Central Europe, the great wheat-importing areas of the world, will be less than the average amount. In England the out-turn will probably be 15 per cent less per acre than that of last year, and 25 per cent less than that of 1884. In Italy and Austria the wheat crops are about 10 per cent below the average, and in Germany, though fairly good, they will hardly reach an average."

THE crops in Scotland promise to exceed the average.

Advices from Adelaide state that the wheat crop in South Australia will yield, according to the latest estimate, an average of seven bushels to the acre. There have been copious rains throughout the wheat-growing region and the rain continues.

A letter just to hand from Cooperstown, N. Y., says: "From a careful estimate made by towns, the County of Otsego may be relied upon for about 5,000 bales of hops, against say 45,000 bales last year—one-ninth. This proportion will hold about the same through the hop district of the State. There are not less than 130,000 bales of brewing hops of 1885 and previous growths now in the country, and I should be inclined to call it 140,000, including the foreign hops. The market is likely at any time to be flooded by German hops."

In Lancaster County, Pa., the center of the Pennsylvania tobacco-growing industry, the continued rains have been exceptionally favorable to the crop, and the average yield to the acre will be 1,300 pounds of Havana and 1,500 pounds of seed-leaf. This is an increase

of between 200 and 300 pounds per acre over last year. Hail did some damage, but only the late storms leave their marks. The early crops outgrew the damage, and in some cases tobacco experts cut down the original crop and cultivated the second growth to full maturity. The damage from this source will be about one-half per cent of the whole crop. Rust is confined to the Havana, but there is little complaint. The crop will be clean and of good quality, unless improper care is taken with the crop in the sheds. In the majority of districts Havana gains in favor, as farmers better understand how to grow and handle it.

A letter from Wilmington, Del., dated Tuesday last, says: "The peach season reaches its hight during this week, and the shipments from now until the 1st of September will be the heaviest of the year. The Stumps, Moores, Oldmixons, and Reeves's Favorite are coming now, and with the end of these varieties the flush of the season passes away. The prices have been higher this season than last, but the quality of the fruit has been inferior. The yield has been about a fourth less, and it is not probable that the coming shipments will make any break in the prices."

The treatening aspect of Eastern Europe on Monday advanced grain prices in this country; but soon a reaction set in. Free selling by "bulls," and the impending deliveries of Spring wheat, which are expected to prove heavy, prevented an advance, especially after an increase of 1,800,000 bushels in the visible supply was announced on Tuesday. On Friday wheat declined here 1c. to 1⅛c. for spot and options on free options. Reports of damage to corn by drought are pretty serious in nearly all cases; but as to the real amount of injury reports are very conflicting.

Butter has been steady during the week with an improved demand for factory grades, but otherwise the market has not been interesting. Advices from the producing centers are an important element of strength. Exporters are not operating freely.

The cheese market has been fairly active during the week, but no improvement has been made in prices, excepting in colored fancy, which is scarce. Exporters are limited to price in their operations, and the failure of Liverpool to respond to the last upward move here has a depressing effect.

On account of factorymen refusing to offer any August cheese, and July being nearly closed out, at Ingersoll, the great cheese market of Ontario, Can., five factories offered 1,230 boxes, 1,030 July 200 August. No sales reported. Twenty factories represented and ten buyers present.

No change in wool during the week. Holders, looking at supply and demand the world over, say present prices will be maintained or advanced.

The September series of sales of colonial wool in London will open ten days hence. All the indications point to firm if not higher prices. The current quotations for leading sorts at Boston are the same as last week, as follows:

Ohio & Penn. X	32@33c.	Fine Ohio delaines	36c.
Ohio & Penn. XX	33@34	No. 1 combing	38
Ohio & Penn. XX and above	35	Texas sp'ng, 12 mos	23@26
Michigan X	31@32	Super A	31@37

According to the latest reports, an unusually large amount of the Western ranges is in poor condition to support grazing stock next Winter. There are every Summer considerable areas in this state, but this year the injury is reported to be much more extended than usual, and even with a favorable season henceforth there is little prospect of recovery. The poor condition of pastures in many sections of the country at present, and the unfavorable outlook on the ranges, have caused a heavy run on the market, and tended to depress prices. The weakness of fat cattle has had a depressing effect on the prices of store cattle, and, moreover, the prevalent conditions afford a rather discouraging outlook for feeding stock. At present nearly 80,000 head of cattle have been thrown upon the Chicago market from Dakota alone inside of two months, and the four or five buyers in Chicago, who control the market there, take advantage of this fact to put the price of beef down to a point where there is no profit for the producers. The Montana ranges are overstocked, and there's no room for pilgrim cattle. The Fall round-up has begun, and the cowboys are ordered to cut out every animal that will make beef or that is old enough for market. Even with this diminution it is a puzzling problem how to winter what is left, and growers are seeking locations elsewhere for a part of the stock for Winter. From the great number of poor sheep lately sent to market, it appears likely that sheep owners are rigorously culling their flocks. This is a good plan for profit in the future, but it depresses the price of ordinary sheep everywhere. Good mutton sheep fetch high prices, but the complaint is pretty general that most of the offerings are miserable stuff.

The Marquis de Mores and "de" Dakota, the chief party interested in the new dressed-meat enterprise here, is jubilant at its success. Said he, yesterday: "We now have three stores in New York, and notwithstanding the boycotting are disposing of 100 cattle a day. By October we shall have six more shops opened, and hope to bring our sales up to 250 cattle a day before January. The cattlemen in the West look upon the venture with considerable favor, and are taking steps to follow my example and supply Boston, Philadelphia, Baltimore, Washington and other large cities with meat direct from the ranch. I am now making arrangements to slaughter and ship cattle for my neighbors on commission; and, furthermore, am putting up a slaughter-house in Kansas City, where corn-fed beeves, hogs and sheep will be dressed during the winter months, thus securing a continuous supply for this market."

The receipts of hogs at Western packing centers have tended to depress prices of products. This effect was produced from this, aided by other causes, and about the middle of the week, owing to free selling, even speculative lard went off and looked despondent. The decline in grain assisted the weakness.

TELEGRAPHIC BRIEFS THIS A. M.

DULUTH, MINN.: Reports from the wheat fields say that the yield is far beyond anticipations, and it now looks as if there will be about as much wheat for the Duluth market as last year.

OMAHA, NEB. During the last three weeks the weather has been very favorable, and crop prospects continue encouraging. The weather is hot and dry at present, but the corn is not suffering from want of rain, and the wheat has nearly all been harvested.

ST. JOSEPH, MO.: The corn crop in North western Missouri has been damaged by drought fully 50 per cent. In Northwestern Kansas they had earlier and more rain, and the crop is estimated at 60 to 75 per cent.

LOUISVILLE, KY.: The corn crop promises a full yield hereabouts. Wheat is coming in liberally and quality improving. Oats, free receipts, holders meeting the market readily.

MARKETS BY TELEGRAPH.

SATURDAY, August 28, 1886.

CHICAGO.—Compared with cash prices a week ago, regular wheat is 1c. lower. No. 2 Spring, ⅞c. lower. Corn, 1¾c. lower. Oats, 1⅛c. lower. Rye, ½c. lower. Barley, 2c. lower. Flaxseed, 1½c. lower. Pork, 10c. higher. Cattle, from 10c. to 25c. lower. Hogs, from 10c. to 35c. lower. Sheep, steady. Few good mutton sheep in the market.

WHEAT.—August, 77@77⅝c; Sept., 77⅝@78½c; October, 79⅝@80¼c; No. 2 Spring, 77⅜c. CORN.—Cash, 41¼c; August, 41⅜@41½c; September, 41¾@42¼c; October, 43⅝@44. OATS.—Quiet; Sales ranged: Cash, 26½c; August, 25⅞c; September 26⅛@26⅜c; October, 27¾@28c. RYE.—Quiet; No. 2, 50c. BARLEY.—September, 59½@60c. FLAXSEED.—No. 1, $1 10. MESS PORK.—Cash, $9 52½@9 55; August, $9 52½@9 55; September, $9 50@9 55; October, $9 60@9 65. LARD.—Sales ranged: Cash, $7 22½; August $7 22½@7 25; September, $7 23@7 35,, closing at $7 25@7 27½. Short Ribs.—Cash, $6 20. Boxed Meats.—Dry salted shoulders, $5 75@5 87½. Short clear sides, $6 60@6 65. CATTLE.—Shipping steers, $3 60@5 02; stockers and feeders, $2 20@3 30; cows, bulls and mixed $1 50@3 10; bulk, $2 25@2 80; through Texas steers, $3 50@3 60. HOGS.—Rough and mixed, $3 90@4 00; packing and shipping, $4 50@5 95; light weights, $3 70@4 05; skips, $2 50@3 50. SHEEP.—Market weak; Natives, $2 00@4 00, Texans, $1 75@3 00; Lambs, $4 10@4 70.

ST. LOUIS.—Compared with cash prices a week ago, No. 2 red wheat is ¼c. lower. Corn, 1⅜c. higher. Oats, ¾c. higher. Rye, ¾c. higher. Butter, about 1c. higher. Pork, 15c. lower. Cattle, about the same. Hogs, from 5 to 20c. lower. Sheep, poor grades unchanged, no prime mutton sheep offered.

WHEAT.—No. 2 Red, Cash, 79@79½c; August, 79c; September, 79¾c. CORN.—No. 2 mixed Cash, 38@38⅜c; August, 38½c; September, 38¾c. OATS.—No. 2 mixed, Cash, 26¼@27c.; August, 26½c; Sept, 26½c. RYE, Sept, 32c. BARLEY.—No market. BUTTER.—Creamery, 18@22c; dairy, 10@18c. EGGS, 12c. FLAXSEED.—$1 06. HAY.—Timothy, $10 00; Prairie, $8 00. PORK.—$10 15. BULKMEATS.—Long clear, $6 25; short ribs, $6 25; short clear, $6 40. Lard, $6 62½. CATTLE.—Market active; Good to Choice Native Shipping Steers, $4 35@4 75; Common to Fair, $3 65@4 20; Butchers' Steers, $3 50@4 50; Cows and Heifers, $2 25@3 50; Stockers, and Feeders, $3 25@4 00; grass Texans, $2 50@3 75. HOGS.—Market firm; heavy, $4 85@5 10, Packing, $4 35@4 55; Lights, $4 10@4 95. SHEEP.—Market firm at $2 25@2 75.

BOSTON.—GRAIN.—Corn.—Steamer mixed at 55½c. per bushel; high mixed, 57½c; steamer yellow 56½c; OATS.—No. 2 white at 38½@38½c. as to location; No. 3 white, 37@37½c. and fancy clipped at 41½@42c. per bushel. RYE, 70c. per bushel. Bran, $14@15 00 for Spring, and $13 75 for Winter; Fine Feed and Middlings at $15@18, and Cotton Seed Meal at $28 50 on the spot, and $21 75 per ton to arrive. HAY AND STRAW.—Choice Northern and Eastern at $18@19 50 per ton, $16@17 for fair to good, $13@16 for fine, and $8@13 for poor and damaged; Western choice, $16@17, do fair to good $14@15. Straw.—Rye straw is held at $16@16 50 for choice, and $13@14 for common to good. Swale hay at $10@11 per ton. Oat straw at $8@9 per ton. PRODUCE.—BUTTER.—Northern and Eastern creamery, extra, 21@22c; extra firsts, 19@20c; firsts, 17@18c; Western creamery, 18@20c. for extra firsts to extra; firsts, 17@18c; Northern dairy, 14@17½c. for Vermont extra firsts to extra; firsts, 14@14½c; seconds, 12@13c; Western dairy, 12@13c. for firsts; seconds, 9@11c; imitation creamery, 11@15c for extra firsts to extra; ladle packed, 9@12c, for extra firsts to extra; firsts, 8@9c; seconds 7@8c; grease, 5@6c. NEW CHEESE. New York and Vermont extra, 8½@9c; do. do. firsts, 8@8½c; do do. seconds, 5@7c; Western extra, 8½c; do. firsts, 7@8c. EGGS.—Capo and near-by, per doz. 18½@19c; Eastern extras 17@17½c; do. firsts, 15@15½c; Northern firsts, 15@17c; Western firsts, 13½c; Provincial, 15@15½c. BEANS.—Choice Northern hand-picked pea, $1 75@1 85 per bushel; do. do. New York, small, $1 60@1 70; do. do. screened, $1 55@1 60; medium choice, hand-picked, $1 50@1 55; do. do. screened, $1 45@1 25; Yellow Eyes, improved $1 50; do. choice flats, $1 25@1 40; Red Kidneys, $1 75@2 00; Canada pea, 65@95c. per bushel for common to choice; green peas, Northern, 90c@$1; do. Western, $1 15@1 20. POTATOES range at $2 00@2 25 per barrel.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, August 28, 1886.

STATE OF THE MARKET.—As compared with cash prices last week, flour is unchanged; No. 3 Red Wheat, steady; No. 2 Red, 1c. higher. Corn, steady. Oats, 1c. to 1½c. lower. Butter, slight increase; cheese, a shade lower. Eggs, 1c. higher. Poultry, steady. Fruits and vegetables steady.

FLOUR, FEED AND MEAL.—FLOUR—Quotations: Fine $2 00@2 65; Superfine, $2 15@2 90; Extra No. 2, $2 70@3 25; Good to Fancy Extra State, $3 30@3 70; Common to Good Extra Western, $2 70@3 70; Good to Choice Extra Western, $3 90@4 70; Common to Fair Extra Ohio, $2 70@3 75; Good, $3 80@4 20; Good to Choice, $4 25@4 75; Common Extra Minnesota, $2 70@3 00; Clear, $3 25@3 75; Rye Mixture, $3 30@3 75; Straight, $1 00@4 60; Patent $4 10@5 10; Bakers' Extra, $3 75@4 50; St. Louis Common to Fair Extra, $2 70@3 65 Fair to Good, $3 70@4 50; Good to Very Choice, $4 55@4 90, Patent Winter Wheat Extra, $4 25@5 10, City Mill Extra for West Indies, $4 15@4 60; South America, $4 00@4 75. SOUTHERN FLOUR.—Common to Fair Extra at $2 85@3 60, and Fair to Choice, $3 65@5 00; Patent, $5 25. RYE FLOUR.—Superfine, $3 20@3 40. CORN MEAL.—Yellow Western, at $2 50@2 75; and Brandywine at $2 80@2 90. FEED.—#) to 50 ℔, quoted 72½@75c; 60 ℔ at at 65@70c; 50 ℔ at 70@75c; 100 ℔ at 85@90c; Sharps at 95c@$1 05. Rye, at 75@80c.

Send us your address (mention this publication) and we will mail you our Illustrated Price and Premium List, and full particulars. Address **NATIONAL TEA & COFFEE CO., Washington St., Boston, Mass.**

For the Young.

I ALWAYS like to see a boy who wants to learn a trade. A trade is a fine thing. If I could be a boy over again, and know what I do now about things, you may be sure that I would be a blacksmith or a carpenter. A man with a good trade at his fingers' ends is in a pretty independent position. Even if he comes to farming at last, and there are few better things that he can do, his trade will be a wonderful help to him. What is a trade? Like every other thing that makes one man smarter than another, it is knowledge. In learning a trade you learn how to use certain tools to the best advantage, and how to keep those tools in good condition. You learn how to handle work, how to put the parts of a machine or any other article together. You learn to think and plan, and the practice trains the hand, mind and eye, so that work is done quicker and better than it was before. You never can do a thing well till you know how to do it. You never can know how until you think out a piece of work, do it in different ways, and study it. Some boys cannot get a chance to learn a trade as they would like. Let them make a trade of their own. Let them stick to their work, no matter how simple and monotonous it may be, until they master it and can do it a little better than any other boy can. This will pay them well. If they do not have a regular trade, they will have the next thing to it, and they will be always sure of a place. There are two things about work that you must always remember. One is that only a good workman can get good wages; and the other is, that the only way to become a good workman is to study your work and be careful over it.

I FAIL to see why a girl should not learn a trade just as well as a boy. Some girls don't want to work. They prefer to have somebody support them. Such girls had better keep away from trades. There are lots of independent girls however who want to support themselves. Many of them want to help their parents. What can such girls do? There used to be a time when it was considered something dreadful for a girl or a woman to try and do anything outside of what men were pleased to call "woman's work." That time has gone by now, and I am glad of it. I never thought much of the colleges for women. I never saw a graduate of one these literary colleges that could support herself at any other business than teaching school, and that is not a very good business to follow for good. There may be plenty of these graduates who can do wonderful things but I have never seen them. There are women doctors who are doing a great deal of good and I wish there could be more of them, but it isn't every person who can make a good doctor; one has to be fitted for it naturally. I like to see a girl learn the dress-maker's trade. With that trade well learned, she is always sure of work. Let her take a regular course at some first-class dress-maker's place and she will be able to earn more money than three-fourths of the men in this country. There are plenty of trades that girls can learn if they only have ambition. I think every girl ought to know how to keep house and to cook. Plenty of girls make money at raising chickens and eggs or at making fancy butter. A woman can make better butter than a man can, any day. It is nearer a woman's work. The same is true of bee-keeping. Any one of these works can be made into a trade if the girls will be patient and ambitious. It will take time and work to make much out of them but there ought to be a great satisfaction to a girl in knowing she can be independent and helpful. I don't think much of these toy girls who can do a little of a great many things and yet can do nothing well.

I saw a cat the other day that was made very useful. He stood out in front of a book store, where old books and pamphlets were sold. He had a wide piece of cardboard fastened around his neck, on which was printed in large letters:

"TAKE A CATALOGUE."

It was a new idea, and everybody stopped to look at it. Many people went in and looked at the books, who would not otherwise have done so. So that cat was a very profitable partner in the business. There was no danger of his running away. When he came to stir I saw that one of his feet had been cut off by some accident. So he was a cripple, and could not run. And yet, with only three feet, he did far more business than a great many cats do with four feet. The boy in the store told me that he bought milk and meat for the cat every day. When a cat is doing such good work in the book business he deserves to have his nights to himself, and should not be obliged to hunt rats in his spare time.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

Monday morning found me at the schoolhouse, as soon after breakfast as I could get there. I was bound to have an early survey of the field. I built a fire in the great stove, and then sat in the teacher's chair to look about me. The floor was battered and cracked, particularly about the stove. The walls were discolored, and in the corners and along the walls a troop of spiders had contributed an example of diligence for the pupils. The seats were battered and old, many of them were broken, and most of them had been carved and cut by restless jack-knives. I afterwards found that this knife study was the favorite one in Bear Creek. My own chair was placed on a little platform near the door. Several of the boards of this platform creaked most suspiciously as I walked over them. A low desk stood unsteadily on three legs, with the other broken so that it pushed under without touching the floor.

A blackboard at one end of the room bore the last faint trace of a mathematical effort in the shape of a collection of straggling figures. Under this was written in great, uneven letters, now nearly obliterated, this legend

"Teacher is a fool."

I found a little consolation in the fact that this statement doubtless referred to the previous teacher rather than to the present one. It was a farewell rather than a welcoming statement. The more I investigated Bear Creek, however, the more I began to think the title might be appropriate in my own case.

Long before the time for opening school the scholars began to arrive. The first to put in an appearance was a little freckle-faced girl. She carried two small books in one hand while the other grasped a large tin pail almost as large as herself. I soon found that this latter receptacle contained her dinner, for after much fumbling she pulled open the cover and proceeded to eat a lunch. She nearly destroyed her pocket in bringing to the light a large, red apple which she brought at last and bashfully handed me.

"You better come to our house jes' soon's you can, teacher."

The corner of her apron which she persisted in pushing into her mouth rendered this invitation a little muffled.

"Why so?"

"Cause we've jest killed our hogs an' they's lots o' fresh meat, an' the minister's goin' to stop to our house next Sunday."

The little girl evidently had not given me the apple purely out of charity. There was method in the gift. She carried her books to a seat conveniently near the stove, and carefully deposited them on the top.

"Say, teacher, I can have my old seat can't I? The ones that gets here first always has first choice."

This seemed reasonable enough, so I told her she might occupy the seat.

"What studies do you like best?" I asked, when she had celebrated her victory by a short dance in front of the stove.

"'Rithmetic, spellin' an' joggerfy, best."

"Don't you like grammar, too?"

"We don't have no grammar here. Pa says they ain't no call fer ter study it, an' I'm glad on it."

Her further explanation was interrupted by the arrival of a large company of scholars. The boys came tramping in at one door while the girls entered at the other. There were very few books visible, but the display of dinner pails was something striking. Bear Creek appeared to believe in specialties. There was to be no attempt to supply nourishment to both mind and body at one time. The body was to be well sustained and the mind left to secure such material as it could conveniently pick up.

The scholars all made a grand rush for the most desirable seats and placed their books on the places they picked out. This seemed to be a regular law of the school. Then they came back and gathered about the stove to examine me. I examined them in return.

The boys were dressed in rough jackets and blue or brown overalls tucked in the tops of their boots. They all kept their hats on and most of them stood with their hands in their pockets, grinding their heels into the floor. They were stout well-built fellows with heavy expressionless faces and little eyes.

The girls were very brave in ribbons and bright calico dresses. They simpered and whispered among themselves, whenever I looked in their direction. The Bear Creek idea of a flirtation seemed somewhat crude but was none the less hearty.

I went about to shake hands with all the scholars. Most of them regarded this movement in wonder. They simply held out a hand and allowed me to shake it. There was no effort on their part to return the hand clasp. After a moment of giggling the girls ran out at the door. I heard them shouting with laughter on the outside.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I am a little girl seven years old, and would like to join the Cousins. My papa has taken the RURAL ever since I can remember and I like to hear the letters from the Cousins. Mamma gave me some of the Garden Treasures and I planted them in a little garden of my own and now I have some lovely blossoms; Mignonett, Candytuft, Pansies and Phlox and many others and one great tall sunflower a great deal taller than I am. I have two little Kittens one white that I call snowball and one maltese I call Molly. I went to school last Spring and read in the second reader, but can't write quite well enough to write to you so Mamma is writing for me. We live on a farm two miles from the city. Your little friend,

Joliet, Ill. MABLE K. DAVISON.

[I can read all kinds of writing so you must write the next letter yourself. Our cat is named Molly too. I wonder if that sunflower is as tall as I am?—U. M.]

DEAR UNCLE MARK:—Perhaps you remember my letter, written to you last August, in which I told you of my "garden in the sky," which was a candle-box filled with earth, in which the peas and beans were growing, which you kindly sent Mamma. It stood on our balcony, up on the sixth story of the apartment house in which we lived, and the beans grew splendidly, too. I did not think then that this year I should be in a real garden and see beans growing in true ground, up still nearer the sky, 2,000 feet above the sea. It was just the nicest place you could wish to see, way up in the Catskill Mountains, sometimes above the clouds. We were on Mr. Bailey's farm, and there were lots of horses, cows, pigs, chickens, etc.; and you could do just what you liked. No signs there, saying "Keep off the grass!" Only a city boy knows how to enjoy such freedom. I could drive one of the horses all alone by myself, and he got so tame he knew me. His name is Prince, and he is 20 years old. He cannot go very fast, is what they call short-winded; but I didn't mind that. I liked to ride rather slowly on those rough, hilly roads.

It was so hard to come back to this dirty city and leave all the lovely fun. In the country, you know, there is always something for a boy to *do*. Harold and two other boys had a tent, and they camped out *regular* for three days, cooked their dinners and slept there. One night it rained hard, and I thought, it was so dark, that the bears would come sure. They did not, and the boys slept soundly all night, not a bit scared or hurt. I slept with "Mino" that night and was not homesick.

We want to go to Jewett again in March, for Mr. Bailey has invited us. Then they are going to make maple sugar from the maple trees, and it seems so funny how they can do it. When I am a man I am going to be a *farmer*. There is nothing like it.

Mr. Bailey takes the RURAL; it seemed like an old friend to find it there. Everybody reads and enjoys it. I am, your little friend,

New York. WALTER F. POOLE.

[I am glad you had a chance to see what farm life is like. I hope you will make a farmer. When you have your own farm I will come and see you. Old Prince must be a good horse.—U. M.]

DEAR UNCLE MARK: I wrote to you once before and my letter went in the waste basket but I was not discouraged. It is a very warm day. It is so warm I would just like to sit still and have some one fan me all day. We had two little pet chickens die; one was my sister's and the other was mine. I had the sick headache but I am better to day. Ma is ironing my white dress. I had an aunt come from York State, and she gave me a nice dress because I had two eye teeth pulled. My Cousin Etta and I went horse-back riding, we both were on the same horse and we made her canter and we both fell off and I skinned my knee badly and my Cousin sprained her ankle so we both go around limping. The sweet peas you sent me have blossomed. We have nine cows, seven calves, 70 young chickens, and two little kittens. One is mine, it's name is Rosabel.

From your niece. ZELLA SHIMMINS.

Delavan, Wisconsin.

[If you had people to fan you how could they stand the heat? That dress was well earned. I don't think I should care to ride in that way.—U. M.]

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

"AN EXCELLENT JUDGE"

The late Gordon W. Burnham of New York, after his return from an extended tour through Europe, said: "I have bought and tried the finest Shaving Soaps made in England and on the Continent, but for months have been longing to be where I could again enjoy the Luxury of Shaving with the GENUINE YANKEE SOAP."

All Druggists keep it. Avoid Imitations. Trial Samples by Mail, for 12c.

PERSONALS.

SIR ARTHUR BASS, of "Pale Ale" fame, enters the British peerage as "Baron Burton of Rangemore and Burton-upon-Trent."

SIR JOHN BENNET LAWES told Professor Morrow that he didn't like to report on a certain line of agricultural experiments he was conducting, because he had carried them on for only 27 years.

JAMES ARMSTRONG, of Loure, Canada, a well-to-do farmer, aged 83 years, fell in love with a maiden of 76 summers, who rejected his suit. Thereupon he made his will, bequeathing her all his property, and then hanged himself.

WHEN the present Under Secretary of the Treasury, Thompson, of South Carolina, was nominated for Governor, a message from one of the State institutions was sent him saying: "Every one in the lunatic asylum is delighted with your nomination."

WHENEVER the Emperor William undertakes to eat his dearly-loved lobster, his doctor invariably shudders and protests, but the aged Emperor merely smiles and continues his meal. He eats a good deal, and is particularly fond of shell-fish.

THE Honorable Frank Lawler, of the Second Illinois District, lately one of the chief spouters in Congress against oleo legislation, may now be found any day behind his bar at Chicago. Nowadays his eloquence is chiefly exhibited in the terse speech: "Wull, gints, wot'll it be?"

AT Windsor, Vt., Wednesday, Senator Evarts of New York, C. C. Perkins of Boston, whose son had married the Senator's daughter, and Miss Matthews, daughter of Judge Stanley Matthews, were thrown from a carriage. Perkins was instantly killed, and the two others severely, though not dangerously, injured.

CONFEDERATE General H. P. Ransom "suicided" by morphine at Lexington, Ky., Wednesday. Married a wealthy widow ten years ago, and at her earnest solicitation resigned his post as General Manager of the Kentucky Central Railroad, and became dependent on her for a livelihood. From the start she made him feel his dependence keenly, and he could endure his position no longer.

DURING all the excitement caused in England last Wednesday by the state of affairs in Bulgaria, the Marquis of Salisbury, the British Prime Minister, and the man who among the Conservatives is trusted most in foreign affairs, was in his laboratory at Hatfield House engrossed in experimenting with an electric invention of his own for driving agricultural machinery—"a favorite hobby with with the Premier," says the cablegram. Lord Iddesleigh (the late Gathorne Hardy), Foreign Secretary, kept telegraphing to him all day, however, and he returned to London at 7 P. M., to work most of the night on diplomatic matters.

ALEXANDER I., Prince of Bulgaria, is 29, having been born in April, 1857. He is the son of the German Prince Alexander of Battenberg, and a cousin of the Emperor of Russia, his father's sister having been the wife of Alexander II. His older brother married a grand-daughter of Queen Victoria, and his younger brother Henry is the son-in-law of the Queen, having a short time ago married her youngest and favorite daughter, Beatrice. He entered the German army in 1870 and the Russian army in 1879, and was elected hereditary Prince of Bulgaria by a unanimous vote of the Constituent Assembly in 1879. He received an income of $120,000 a year with the maintenance of a palace at Sofia. In September, last year, Eastern Roumelia rebelled against the Porte and declared itself a part of Bulgaria, and Alexander took the title of Prince of North and South Bulgaria. To prevent the union Servia declared war and invaded Bulgaria; but Alexander, who had served with distinction in the Russian army in the war against Turkey, completely routed the Servians, gaining great glory by his energy, skill and good sense. Russia still opposed the union, however, and Turkey insisted on maintaining her control, and Alexander had to be contented with the Governorship of Roumelia for a term of years. He had incurred the bitter enmity of his cousin, the Czar, and his downfall is due chiefly to Russian plottings against him, as the Bulgarians are partly Slavs like the Russians, and look on the latter as their deliverers from the grievous Turkish yoke by the war of 1877.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake,

Humorous.

LAW'N ORDER: "Keep off the grass."—*Detroit Free Press.*

IF it was not for the weather there never would be any variety in some people's conversation.—*Texas Siftings.*

THE House to the Senate: "Please pass the oleomargarine," and the Senate passed it.—*Rochester Post-Express.*

THE fat woman at a dime museum may not be "all wool," but she is generally "a yard wide or more."—*Norristown Herald.*

"I THINK I wear twos," she simpered to the shoemaker, "do I not?" "Yes, ma'am," said the honest dealer, "you wear twos." Then under his breath; "One on each foot."—*New York Sun.*

AGED NEGRO, speaking into street letter-box: "Hullow in dar! Is dar any letters for Efraim Sines? Umph! don't pay no 'tention to cullud gentleman's question, eh? Knowed it ud be dat way as soon as de Democrats got in offis."—*Judge.*

FOND FATHER: "How is this, Charles? Your standing at the last examination was very low." Charles: "Yes, sir." F. F.: "What is the reason?" C.: "Well, those old professors went and asked a lot of questions that I could not answer."—*Detroit Free Press.*

BAGLEY: "I notice that you frequently speak of things that happen at 2 A. M., and so on. Are you a newspaper man?" DeBaggs: "No, but I frequently walk the streets all night." "Insomnia?" "No. My wife locks the door at 10 p. m."—*Philadelphia Call.*

MAUD: "Yes, I have sent him back his letters; given him back his ring." Edith: "And are you happy?" "No, I am miserable." "Then why did you do it?" "Well, pa and ma were so pleased with him I was afraid we weren't suited to each other."—*Omaha World.*

"HAVE you traveled much?" asked a picnicker of a Butler County youth at a picnic last week. "Traveled much!" replied the young fellow; "I should say I had. Why I go to Sharpsburg every week with a load o' hay or suthin'."—*Pittsburg Chronicle-Telegraph.*

"MATTIE, Mattie," called out an Omaha dame to her daughter, "I wish you would play something else besides Wagner. I am so sick of it." "I am not at the piano, ma," responded the daughter from an adjoining room. "Then who is?" "Nurse and the Baby."—*Omaha World.*

A LITTLE boy was watching his mother make sandwiches to carry to the picnic last Thursday and asked what she was putting between the biscuits. She replied: "Deviled ham." He thought for a moment and then said: "Well, you needn't give me any of that bad man's ham, for I belong to the Star of Promise."—*Fairhaven (Mass.) Star.*

A COUPLE from the humbler walks of life came before a Justice of the Peace to be married, when, the ceremony being over, the bride began to weep copiously. "What's the matter?" asked the new husband. "I never told you that I don't know how to cook," sobbed the bride. "Don't fret. I'll not have anything for you to cook. I'm a poet."—*Fliegende Blaetter.*

BACHELOR: "What in the world are you hunting around on the carpet like that for?" Benedict: "I want a pin." Bachelor: "Want a pin? Why don't you look on the pincushion then?" Benedict (looking up in surprise from his search): "See here, old man when you've been married as long as I have you'll know where to look for a pin when you want one."—*Exeter Gazette.*

NOT THE BUSTLE HE MEANT.—"There has been an awful bustle here this afternoon," said Spicer to Mrs. S., who had just returned to the hotel from an afternoon ride. "I know it," remarked the lady viciously, "it made me look like a camel and I have sent it back to the clumsy woman who made it. Now what are you grinning at, Seth?" But Spicer had bustled out of the room without vouchsafing an explanation.—*Boston Bulletin.*

The machine that gave Grandmother a tired back makes a pretty plaything for the girls.

TOWER'S FISH BRAND TRADE MARK

None genuine unless stamped with the above TRADE MARK.

SLICKER Is The Best Waterproof Coat Ever Made.

Don't waste your money on a gum or rubber coat. The FISH BRAND SLICKER is absolutely *water* and *wind* PROOF, and will keep you dry in the hardest storm. Ask for the "FISH BRAND" SLICKER and take no other. If your storekeeper does not have the "FISH BRAND", send for descriptive catalogue to A. J. TOWER, 20 Simmons St., Boston, Mass.

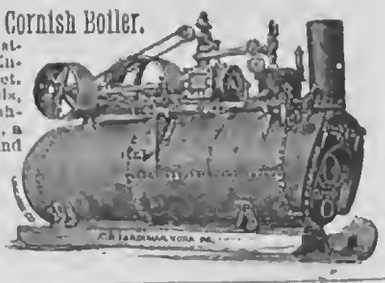
Whitman's Patent Americus.

The best Cider and Wine Mill made. Will make 20 per cent. more cider than any other. Geared outside. Perfectly Adjustable. Prices as low as any first-class Mill. Mfrs. of Horse-Powers, Corn Shellers, Hay Presses, Feed Cutters, Mills, etc. Send for circulars. Whitman Agricultural Co., ST. LOUIS, MO.

Improved HYDRAULIC RAMS Send for Circular and Price List. Address ALLEN GAWTHORP, Jr., WILMINGTON, DEL. Awarded Medal and Diploma at the Centennial Exhibition, Philadelphia.

Ajax Engine on Cornish Boiler.

The cheapest, first-class, horizontal Engine in the market. Engines of all kinds, for Sawing, Threshing, and Ginning, a specialty. Saw and Grist Mills, Threshing Machines, etc., a specialty. Send for Illustrated Catalogue. A. B. FARQUHAR, York, Penna.



20 Gold bevel-edge, All Hidden Name Cards, 15c. Agents' Sample Book, 25c. 12 Scrap Pictures and Sample Case, 2c. GIVIN BROS., Cadiz, Ohio.

FRUIT AND ORNAMENTAL TREES SMALL FRUITS, BULBS, SHRUBS AND ROSES. Special attention is called to our remarkably Fine Stock of STANDARD AND DWARF PEARS ALSO GRAPE VINES Including such kinds as Niagara, Jessica, Empire State, Willis, Frances B. Hayes, etc. Prices reduced to suit the times. Correspondence solicited. Catalogue Free. 32d Year. 600 Acres. 21 Greenhouses. Immense Stock. THE STORRS & HARRISON CO. PAINESVILLE, Lake Co. Ohio.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1911. NEW YORK, SEPTEMBER 11, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

SHORT-HORNS.

"Saxon and Norman and Dane are we," the English say of themselves and, according to tradition, the same may be said to a limited extent of Short-horn cattle, the most highly prized and widely-diffused breed among the English-speaking race. In England, Ireland, Scotland and Wales their presence and influence are everywhere. In Canada and the United States they have found so congenial a home that the choicest and highest-priced specimens of the breed have been developed on this side of the water. In Australia and New Zealand they are prized as highly as on the banks of the Tees. Nor are their praises unsounded in foreign tongues. They are improving the standard of the coarse, shaggy herds of Russia. The best German breeders profit by their merits. In spite of the high opinion which France entertains of her own choice breeds, many Short-horns are imported for the improvement of her herds. Even Japan has been Europeanized in her appreciation of Short-horns, as well as in other respects.

Wide as is the fame of the breed to-day, however, until about a century ago their reputation was confined to the counties of Durham, York, Westmoreland and Northumberland. The cattle of the two first-named counties, on either side of the river Tees, had for several centuries been celebrated for yielding, under generous treatment, larger quantities of milk than any other breed on the island. They were generally wide-backed, well-formed animals, deep in the fore-quarters, soft and mellow in the hair and "handling," late to mature, though afterwards they fattened rapidly and gave heavy weights of coarse-grained, dark-colored flesh whose flavor was inferior to that of the smaller breeds. Their horns were somewhat larger than those of their descendants, and widened upwards. Their shoulders and hips were unduly prominent; they lacked length in the hind-quarters, width in the chest and fullness before and behind the shoulder itself. They were unduly large-bellied and uneven in appearance owing to their failure to take on flesh evenly and firmly. Such were the beasts out of which the present breed of Improved Short-horn cattle was developed.

The year 1780 marks the beginning of a new era in the history of Short-horns. A new impetus was given to breeding stock at that period by the wonderful effects produced by the genius of Robert Bakewell, of Dishley, with Leicester sheep, Long-horn cattle and cart horses. His method in breeding was to select animals of the best blood, possessing as nearly as possible the form he needed for the objects he had in view. He then bred them strictly in their own families, breeding in-and-in as closely as possible—often daughter to father and mother to son—so long as constitution, vigor, quality, health and fecundity remained unimpaired. He never went outside of the family except when he found specimens elsewhere which he considered would still further improve his stock. By this means he concentrated in the members of one family all the virtues he sought to perpetuate so firmly as to endue them with the faculty of transmitting their special qualities to a greater extent than had ever before been possible by any system of breeding. This system was inferred from Bakewell's practice, for he never disclosed his methods; and, with few slight modifications, it is the same as that by following which the most celebrated subsequent breeders of all kinds of live stock have accomplished their highest successes.

Among the interested visitors to Dishley were two young men, Robert and Charles Colling, sons of a substantial Teeswater farmer and breeder, who were about to start in business on their own account. During several visits they carefully examined Bakewell's stock, learned all they could of his system, and on their return north, applied what they had learned to the breeding of the Short-horn cattle of their district, being more fortunate in their material to start with than was Bakewell with the Long-horn cattle of his section. Beginning business jointly in 1780, they amicably separated three years later—Robert, about 30, and a confirmed bachelor, settling on a farm at Barmpton, and Charles, married, though a couple of years younger, taking another farm at Ketton. The farms were near enough to each other to allow the brothers to use the same bull in the same or alternate seasons, while each profited by the other's experience. Each, however, had his own cows carefully selected from the surrounding Short-horn herds, the choice of every purchased animal being determined by its possession of some particular excellence which the purchaser wished to introduce into his own stock. Thus they labored, Charles for thirty years and Robert for forty, making such marked improvements in the herds they bred that, under their management, the Short-horn race attained an unprecedented popularity which has continued to increase and spread until to-day.

GOLDEN THISTLE. Fig. 351. (See page 590.)

On the sale of the Ketton herd, of 18 bulls and 29 cows and heifers, in 1810, and of the Barmpton herd of 18 bulls and 89 cows and heifers, in two lots, in 1818 and 1820, the choice results of the labors, skill and experience of the Collings were scattered among the best breeders of the day, who eagerly competed for them at unprecedentedly high figures. Among these breeders the most celebrated were Thomas Booth, founder of the Booth Short-horn herd, and Thomas Bates, founder of the Bates herd. The former was a neighbor and rival of the Collings, having begun breeding in 1777 on a farm near Studley Park, although the legitimate foundation of his herd was not laid till 1790 at his Killerby and Warlaby estates near Darlington, Yorkshire, not far from Barmpton and Ketton. His two sons, Richard and John, joined him in breeding, and after his death, in 1837, succeeded him, the former at Warlaby and the latter at Killerby. On the death of Richard, in 1864, his nephew, T. C. Booth, inherited the Warlaby estate and soon made the Warlaby herd the finest representative of Booth blood. To this blood belong some of the most famous Short-horn tribes, such as the Fairholme or Blossom, the Bright Eyes, the Halnaby or Strawberry, the Bracelet, Isabella, Farewell, Boughton, Dairymaid or Moss Rose tribes, all of which, whether belonging to the Studley, Killerby,

or Warlaby contingent, have spread the fame of the Booth blood far and wide.

A worthy rival of the Booths was Thomas Bates, crotchety, kind-hearted, acrimonious, and an extremely skillful breeder. Having started Short-horn breeding in 1800, at the age of 25, he devoted an ample fortune, fine abilities and the rest of a long life to the production of a herd of such transcendent merit as to insure his lasting fame. At his death, in 1849, no Short-horn herd on the globe excelled his, judging from the prizes, prices and renown since won by the tribes he established. Of these the first in order of time, in his affectionate care and in world-wide celebrity, comes the Duchess, closely followed by its near relative the Oxford, while the Waterloo, Red Rose, Wild Eyes and Foggathorpe tribes have all deservedly won high reputation.

What these famous breeders, and a multitude of others hardly less renowned, have effected by way of improvement in the course of a century can be readily seen by comparing the splendid Short-horns of to-day with the coarse Short-horns before the Collings' time, as above described.

What a magnificent head is that of the heifer, Golden Thistle, on our first page, the property of W. A. Harris, Linwood, Kansas, which was bred by A. Cruikshank, Aberdeenshire, Scotland.

STOCK JOTTINGS.

POINTS OF DEVONS.—There has been considerable discontent in England the past season at the conflicting and bewilderiug decisions of judges in making awards of prizes among Devon cattle, aud it is proposed to define more clearly the points of Devons. In this couutry there is no breed whose characteristic points are so clearly marked as those of the Devons; but in England there are the Devon-Devons and the Somerset Devons. The former are the more symmetrical; the latter the larger; the former the more suitable for hilly districts and medium soils; and the latter for more level and rich districts. Hence differences of opinion: one mau wants size; another, symmetry. The favorite Devons, however, are a medium-sized breed, and many object to any attempt to enlarge the size by breeding or in any other way, as certain to entail loss of caste, and spoil the lot. The list of prizes for Devons is being somewhat coutracted by English agricultural societies.

DEVONS SLIGHTED.—There is some iudignation among breeders of Devon cattle at the slight notice taken of their favorites in reports of exhibits at fairs, and it is especially charged that Short-horn and Aberdeen-Angus, men are trying to belittle the solid reds. Doesn't the fault, if there is one, lie chiefly with the Devon men? They have probably the best established of all breeds; when have they ever tried to "boom" them, or even to call a just amount of attention to their merits? They should hardly expect others to take up the part of their business they themselves neglect.

ERGOT AND ABORTION.—Ergot on rye, grain or grass, is a fruitful cause of abortion in cows. This is now generally regarded as a malformation of the grain or grass, due to a parasitic fungus attached to it from its earliest development. It is a protuberance which grows out in a curved form, resembliug a cock's spur, from among the grains of the grass tribe, as wheat, barley, and especially rye. In the latter it is known as spurred rye. The spur-like protuberance should be readily recognizable. The ashen hue of the earlier stages gives place, later on, to a dark-purplish color. It attacks only the flowering branches or panicles of the grasses, and it is useless to look for it on the stems or leaves. The sides of streams and ditches, hedgerows, and other places where uncut grasses are allowed to flourish, should be regarded with suspicion, and, on the discovery of ergot, in-calf cows should be kept away from the spot till the ergoted grasses have been gathered and burnt. Abortion once commenced in a herd of cows may extend merely by sympathy; and the loss and inconvenience are so great as to render trivial any trouble involved in keeping a sharp lookout for ergot, provided those in charge of cows know where to look for the pest, and how to recognize it.

ABERDEEN-ANGUS CATTLE.—At the annual meeting of the Polled Cattle Society held the other day at Aberdeen, Scotland, it was announced that Vol. X. of the Herd Book had been issued February 15, and that Vol. XI. would close January 1. For this 1870 entries had been already received, 126 of them being from America—about two-thirds fewer than usual. Of the 126 animals from this country seeking entry 117 were bred on this side of the water. Vol. I of the American Aberdeen-Angus Herd Book was published in July, and hence there is some doubt about the advisability of permitting American entries in the Scotch Herd Book henceforth. The matter is under advisement. Hitherto these cattle have been known in Scotland as polled Aberdeen or Angus; it was decided henceforth to call them Aberdeen-Angus, a name adopted here nearly two years ago.

REMOVING OBSTRUCTION IN COW'S THROAT.

I notice a device in a late RURAL for removing an obstruction from a cow's throat. I find that "gagging" the animal is almost, if not quite, a sure cure. In fact, I have never known it to fail. My method is to take a piece of a round stick, the size of a fork-handle about a foot long, and place it through the animal's mouth so that the ends stick out at either side. Press it firmly back in the mouth as far as possible. Tie a string to each end of the stick, and up over the head, or around the horns, to keep it in position, and leave the animal for a short time. The obstruction will pass away without further trouble.

New Berlin, N. Y. J. S. B.

Horseman.

GENERAL CARE OF THE FEET OF THE HORSE.

DR. F. L. KILBORN.

Importance of sound feet; great care essential; evils of bad shoeing; brittle and contracted hoofs; hoof ointments; bruises, pricks, strains, etc.; importance of rest.

THE foot is one of the most important and complicated members of the horse economy; moreover, it is a member more liable to injury and disease than any other part of the animal. And yet, how many of the readers of the RURAL are there that ever give any special attention to the condition and care of their horses' feet? Many appear to believe that the only attention the feet of a horse require is to be re-shod whenever a shoe becomes loosened or lost, whether it is in one or six months.

While bad shoeing is undoubtedly the most prolific cause of diseases of the feet, due largely to the deplorable condition of our present farrier system, still there are many other matters in the care of the feet that every farmer can and ought to look after. Through this carelessness and inattention, and I may say ignorance, especially on the part of the average farrier, more horses are either blemished, permanently injured, or ruined than by any other method. An occasional systematic inspection of the feet and limbs should be made, to see that they are being kept in the proper healthy condition. This will enable the owner to discover any slight injury or disease in the earlier stages when treatment is comparatively simple, and recovery much more certain. It will also cultivate a habit of observation that will be invaluable to every horse-owner.

Whether at work or standing idle, all dirt and manure collecting in the shoe should be daily removed, preferably at evening, with a blunt-pointed iron instrument. If allowed to remain it dries, retains or increases the heat of the foot, and tends to drying and brittleness of the sole. During the Winter there is very little danger from drying and contraction, but during the heat and droughts of Summer the danger is greatly increased. Horses that are constantly kept on dry roads or paved streets or dry stables are quite liable to suffer from over-drying. Simple contraction, however, must not be confounded with the contraction which so frequently results from various diseases of the feet. The former occurs only occasionally; but the latter very frequently. One of the most common causes of contraction from drying is the prevailing custom of farriers to mutilate the hoof by excessive rasping and paring. In their opinion, an animal is not properly shod unless a large part of the surface horn—the great safeguard against excessive drying—is removed. The progress of contraction can very readily be seen by observing the heels and frog. As contraction goes on, the heels approach each other—"turn in"—and the frog becomes dry, hard and diminished in size. An excellent method is to keep accurate measurements of the feet, taken when they are in good condition. These can be used as a ready means of comparison, and will indicate the degree of contraction at any time.

Wetting the feet frequently, especially when heated, while answering a very good purpose in many cases, is a questionable practice. Better to allow the horse to stand for several hours daily for a few days in a puddle of clay or a water-bath just deep enough to cover the hoofs. Turning the horse on a wet pasture for several days, pasturing at night, or even for a few hours in the morning where there are heavy dews, are all beneficial; It must not be forgotten that after such soaking or moistening, the hoofs are, for a time, even more susceptible to drying influences than before; so that to counteract this tendency, a suitable hoof-ointment should be repeatedly applied after the soaking. These hoof-ointments can very frequently be employed to advantage to prevent excessive drying, not only after soaking, but whenever the hoof is drying from other causes, and especially after the hoof has been unduly rasped by the farrier. An excellent simple ointment for this purpose is a mixture of equal parts of the best pine tar and vaseline, to be applied daily as long as required. A horse should not be allowed to stand on or near heating manure, in urine, or on any decomposing substances. It injures the quality of the hoof, rendering it dry and brittle.

In recent bruises, pricks, strains, or other injuries to the feet where inflammation is liable to result, cold water is one of the best of applications to keep down the inflammation. Loosely fasten a piece of old blanket or sacking about the injured foot, and keep it saturated with cold water until the inflammation is reduced. In very severe cases, or in those not promptly attended to, a warm poultice may be more soothing.

Rest is an all-important part of the treatment. If this is neglected, and the animals kept at work, or if it is not promptly and properly treated, structural changes may soon occur, which will render the case very difficult to cure, or perhaps altogether incurable. Too much importance cannot be given to the *early*, proper care of all injuries and diseases of the feet. Rest, without treatment, is usually better than treatment without rest, but to secure the best results the two must be combined.

In the case of strains or sprains, the animal should be allowed to rest for several days, or in severe cases for several weeks, after an apparent complete recovery, otherwise a return of the lameness in an aggravated form frequently results. In all cases of wounds that are discharging, a free opening should be made for the discharge of the pus; the cavity should be thoroughly swabbed out with some astringent anti-septic wash, (as sulphate of copper or zinc, carbolic acid, etc., one dram in a pint of water), and dressed with tar. Perfect cleanliness should be observed; all wounds should be carefully cleaned and the foot bandaged, when necessary, to retain the dressing and keep out the dirt. During the enforced rest the animal should be kept on a restricted laxative diet; when again put to work, it should be gradual, until there is no danger of a recurrence of the injury.

WILD MUSTANGS IN NEW ENGLAND.—A number of wild Western cowboys are traveling through New England just now, selling mustangs to the farmers and all others who will buy them. They are reported to have operated to a considerable extent in other parts of the country also. They advertise ahead of their arrival; and on entering a town, with long strings of prancing, cavorting, mane and tail-tossing mustangs, turn them loose on the fair ground or some other large inclosure, and hunt them down on trained horses, lassoing and capturing them, to the huge delight and admiration of the assembled neighborhood. The fire, vigor and speed of the ponies; the wild gestures, long, free-flowing locks and bedizened garb of the riders, and the excitement of the entire scene, predispose the farmers to bid good prices for the mustangs when they are put up at auction at the close of the performance. The "steeds of the prairie" are thought to be tougher, hardier and gamer than the native horses, and many a quiet farmer, doctor and deacon is induced to invest in one. In nine cases out of ten, after a short time he wishes he hadn't. Most of the animals have never been broken. None of them has learned to prefer oats to grass, or even Canada thistles. All of them have strong objections to barns, which many of them soon emphasize with their heels. Although not very high, a fall from one of them either bucking or swerving or stopping suddenly when dashing along at full speed, hurts quite severely, as is evidenced by numerous bruises and contusions and some broken limbs. The enthusiasm for them soon dies out wherever they are well known, and the opinion is becoming general that, however well adapted they may be to the "Wild West," they are much less valuable for Eastern use than the native stock.

Sheep Husbandry.

Notes from the Western New York Farm.

WINTERING LAMBS.

THE OLD WAY. DOES IT PAY?

At least 900 out of every 1,000 lambs wintered, are either raised on the farm or bought in the Fall and either turned into the barnyard or an open field in which is a stack of hay and there compelled to run through the Winter, with little or no water except what they may get from some hole cut through the ice or by eating snow, and with no protection except the fence or the lee side of the hay or straw stack; or perhaps in the most favorable instances they may have an open shed to run under, and this is always the coldest and most windy place on the farm. They are usually given two feeds of hay daily and allowed to pull what straw they can from the stack, and a portion is usually scattered about the yard each day. The hay given them is seldom pure clover cut in proper time; but is usually a mixture of Timothy, June Grass, Red Top, and clover often much over-ripe when cut.

So treated we find them in Spring gaunt and feeble. What little growth they may have gained in frame has been at the cost of the flesh. The majority are badly infested with ticks and in many flocks a large percentage have yielded their pelts to ornament the fences and their emaciated carcasses to feed the hungry swine. Is it any wonder that the owners in disgust assert that there is no money in lamb raising, and that lambs are the very worst stock a man ever did try to winter?

THE BALANCE: WHERE IS IT?

Even under the most favorable conditions, the balance must be small, and without estimating the value of the manure for use on the farm, it must appear on the wrong side of the account. Suppose a lot of lambs are taken, weighing 60 pounds in the Fall; such lambs are richly worth four cents per pound. To carry them through the Winter without loss in number or weight would require at least three per cent. of their live weight in good clover hay daily, besides what straw they might get. This would amount to 325 pounds each. At this rate the account against the lambs will be, for cost price, $2.40; for 325 pounds of hay at $8.00 per ton, $1.40; for interest for six months on cost price, .07, making an aggregate of $3.87 each. For this we have, after shearing, a yearling sheep worth three cents per pound, and if it has gained in weight as much as the weight of fleece taken off, it would be worth $1.80. The seven pounds of wool would have sold for 25 cents per pound, or $1.75 for the fleece. The manure well cared for and used, is worth half as much as the hay, or .70. This makes a total of $4.25, and shows a balance in favor of the sheep of 38 cents; but when exposed as it would be where lambs were so wintered, the manure would lose by washing and evaporation at least half its value. Deduct this and the profit vanishes.

On looking this estimate over carefully it will be seen that if any error has been made or any over-valuation allowed, it has been rather for than against the lambs, so that this method has nothing to recommend it, even where the conditions are all most favorable; and where ordinary mixed meadow hay is substituted for the clover, or where a less quantity is given, the case will show much worse. They will absolutely fall away in flesh, and more or less will starve to death.

Every observant man must bear testimony to the truthfulness of this presentation of the case, and must admit that there is not only no profit, but that there is an absolute loss in the wintering of lambs as it is ordinarily done. It would be far better for the farmer to sell his lambs in the Fall, as there is always a good demand for them then. What deceives people is the fact that they look at the result of keeping them during the whole year, and think that the value of the yearling and its fleece is so much to be credited to the flock, when they should consider the value of the lamb in the Fall, and compare that and the cost of food with its Spring value after shearing. In the next "Notes" I will endeavor to show that there is a better way, and what that better way is.

It is now high time that lambs were taken from the ewes. What they get in the way of milk does not compensate for the annoyance they are to the ewes, and it only spoils their appetite for grass. They should be put into good, fresh feed and where they cannot hear the bleatings of the mothers. They should have plenty of fresh water and must be fed daily an allowance of a mixture of bran and corn, equal parts. This will keep them growing nicely and bring them into winter-quarters strong and fat.

AT last, on the 16th of August, over 65 days' continuous drought was broken by a fine rain, and again on the 24th. We have had enough to wet down as deep as the plow runs. These will greatly benefit late corn and potatoes, and enable the farmers to properly fit the barley and oat grounds for seeding, which could not have been done had the dry weather continued.

IT is wonderful how quickly the grass starts

after a good rain succeeding a severe drought. Those fields which two weeks ago were as brown and sere as in Winter, are now fresh and green, affording a good bite to the stock.

Much new seeding has been injured, some ruined beyond recovery, and still many fields on which every particle of clover looked as though dead, are starting out with a new growth and now look as though with a few more showers they would make good meadows. J. S. WOODWARD.

HAMPSHIRE DOWN LAMBS.—Lately Professor Wrightson, of England, speaking of Hampshire Down sheep, challenged the breeders of any other kind of sheep to produce a flock which will give an equal weight of mutton at the same early age. He insists that no sheep will give so good a return for the food consumed. He gives the live weight of seven of his lambs, averaging 142½ pounds each. Mr. A. W. Wells, of Berks, "goes some better," as seven of his Hampshire Down ram lambs, born on Xmas Day, and sold July 27, weighed respectively 188, 184, 178, 178, 177, 174 and 166 pounds. These, it is true, were the pick of the progeny of 326 ewes; yet the weights are wonderful. He claims high quality as well as quantity of mutton. A number of other accounts of wonderful weights of Hampshire Down lambs are given in late European papers. This breed is gaining ground steadily on both sides of the water.

AN OLD-TIME SHEEP "BOOM."—Many people talk as if "booming" live stock in the way of securing big prices for them originated yesterday or the day before and in this country; but as long ago as 1786—just a century ago—the famous Bakewall, of Dishley, obtained from each of two breeders $2,000 for the use of a famous Leicester ram a single season, after reserving one-third the usual number of ewes for himself, thus valuing the use of the ram for the season at $6,000. Three years later he obtained $16,000 for the use of ten of his best rams, and $15,000 for the use of the rest of his flock—or $31,000 in all in a single season. Has an American sheep "boom" ever equaled that?

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

A NEW LABEL FOR PLANTS, SHRUBS, TREES, ETC.

When the Rural Grounds were laid out upon the site of an old apple orchard, 13 years ago, one of the first problems to solve was the best kind of label to adopt. Many were tried and given up. For shrubs and smaller plants an inch square pine stake, a foot long, pointed at one end, was used. This was painted white, except the lower part, which was dipped in warm tar. Such stakes, if again painted and dipped every three or four years, will last for 15 years at least. The work of re-painting, re-marking and tarring is the chief objection. An improvement upon this stake is shown at Fig. 353, No. 3, a device of J. T. Macomber, of Grand Isle, Vermont. The little wood label is screwed in on the top, and is intended to cover and protect the name, which is written on the stake underneath. It is easily pushed aside, and replaced when the name is to be looked at. Mr. Macomber says:

"I have used it two seasons, and the names are as fresh now as when written. The stakes should be made long enough to allow of their being driven ten or twelve inches in the ground."

For trees the zinc label was tried, the name written with an acid ink and secured by a copper wire. Prof. Gale was the first to suggest to us that a common lead pencil answered every purpose of the ink. The writing is not plain at first, but it becomes distinct in a short time and so remains. The objection to the zinc label was found to be that its movement upon the wire with every breath of wind, gradually wore the hole larger, and unless looked to from time to time, the labels were liable to drop off. To remedy this we suggested the double loop through the hole, so that the label should be firmly bound by the wire. But this was found not to overcome the objection entirely. There seems to be an electrical action between the copper and zinc which slowly wears upon the zinc and allows the play which the double loop was intended to prevent.

Let us now endeavor to explain our latest label, which, thus far, promises to be the simplest and freest from objection of any label and attachment known to the writer. Strips of zinc are procured from the tin store at a nominal price, and cut in various lengths, which, with a little coil of copper wire, are always carried in a certain pocket of the coat usually worn during working hours. These strips are bent over at the top, so as to bind the wire, as shown in Fig. 353 (4, 5) and Fig. 352 (2 and 1). The name may be written either on the under or upper side, and the wire twisted about the stake, as shown at Fig. 353 (4 and 5). If written on the under side the label may be raised up (see No. 4) to show the name, and replaced (see No. 5). A poor quality of zinc, after a few days' exposure to the weather, often forms a white corrosive

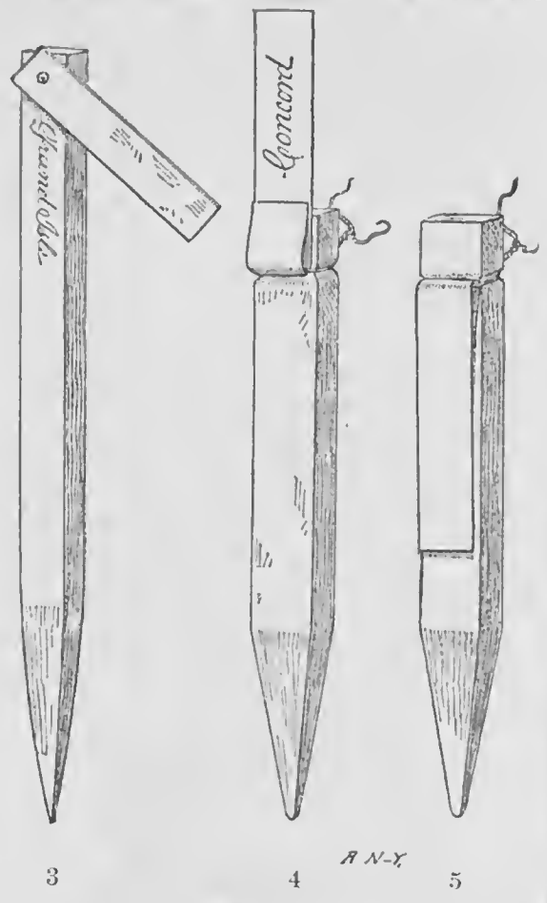


Fig 353.

powder on its surface, which soon obscures the pencil marks. When protected by the stake, as in No. 5, this powder does not form, and the writing will remain distinct for years and years, as we believe. A good quality of zinc, however, does not need this protection. Here there is no play whatever of the zinc upon the copper wire, and there would seem to be scarcely any limit to its durability.

When the stake rots the label may be removed and affixed to a fresh stake. For trees this arrangement thus far seems to be equally effective.

The engraving, Fig. 352, is imperfect. The

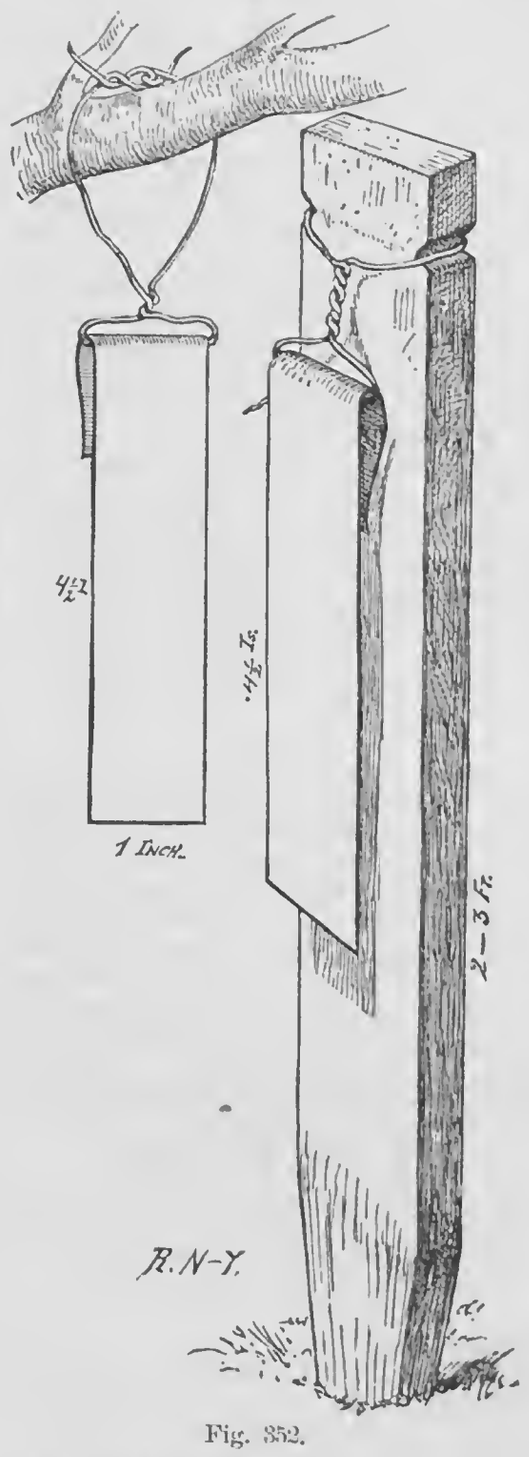

Fig. 352.

copper wire should be twisted firmly around the zinc as shown, and the short fold of the zinc pressed upon the other or main part so that the wire is held by the two parts of the label. This, however, is not essential as the weight of the zinc prevents it from blowing off. To provide for the growth of the branch to which the wire is attached, one end of the wire should be a loop through which the other end passes extending five or six inches or more as desired beyond the loop and merely curved over so as to hold the label. As the branch grows, the loop will enlarge or may be adjusted.

THE YELLOW-WOOD.

THE following letter explains itself, and we are glad to present it in support of our own appreciation of this beautiful tree:

IN the RURAL of June 26th, page 414, you make allusion to the Yellow Wood (Cladrastis tinctoria) being in bloom June 7th. Here it was in bloom about the same time. Our tree is a foot in diameter one foot from the ground, and is about 20 years old. It is, indeed, as you say, the most beautiful of trees, especially when covered with its graceful white flowers. These with the pale green leaves make a delightful contrast. The bark is smooth and somewhat variegated as in the sycamore. It is vigorous and hardy—not subject to attacks of any insects. It is comparatively rare in this section; in fact, I have not seen it planted extensively anywhere as it deserves to be. In the report for 1885 of the Pennsylvania Fruit Growers' Association, I made special mention of it.

You certainly have not over-praised it, and those who will try it will thank you for the advice in regard to planting this tree.

Cumberland Co., Pa E. H. COCKLIN.

BLACKBERRIES.

IF you plant the Snyder or Taylor Blackberry, you will get about everything there is in this fruit except size. The Taylor is a little later than the Snyder, and the berry averages a little larger. If you plant the Kittatinny you will get about everything except the extreme hardiness of the Snyder and Taylor. If you plant the Wilson Junior, you will get more berries perhaps than from any other kind, if the plant will endure your climate, which, if severer than that at the Rural Grounds, it will not do more than two years in five. It is, however, hardier than its parent, the Wilson. If you want a curiosity in the blackberry way that needs protection, try the Crystal White. The berry is white and sweet like a mulberry—the plants not productive. Among the new blackberries, Bonanza is worthy of mention. It is hardier than the justly famed Kittatinny, the berries are about as large, though scarcely as sweet, and it is about as productive. It appears somewhat before the Kittatinny and is desirable also for that reason. If you plant the Early Harvest you will get the earliest and prettiest blackberry in cultivation It is hardy here two years in five, we should say. The crop is used up by the time the Kittatinny begins to ripen. If you want a good and prolific dewberry, try the Lucretia. Its berries are large and of fair quality, ripening with the wild dewberries. Why anybody wants a blackberry that it is so hard to pick and that takes the space of several standards, is difficult to say. Stone's Hardy is worthless here. The berries are small and imperfect.

EARLY OHIO POTATO.—It has often been stated in these columns that the Early Ohio is the earliest potato ever grown at the Rural Grounds. The present season's trial further confirms these statements. In the same row were planted the Beauty of Hebron (?) and the Rural Seedling, No. 1. The vines of the Ohio died July 9th. There were seven hills, which yielded 9¾ pounds, which is at the rate of 337 bushels per acre. There were 57 potatoes, of which 45 were marketable. This is considered a rather small yield for the rich plot in which they were grown. As the tops of this variety are always small, the hills might have been closer.

The vines of the Rural No. 1 died July 15. There were six hills which yielded 15½ pounds, or at the rate of 625 bushels per acre. The whole number was 99, of which only 58 were marketable.

Five of the seven vines of the Beauty of Hebron were still quite green when the potatoes were dug. The seven hills yielded 26 pounds, or over 898 bushels to the acre. There were 78 tubers, 63 of which were of marketable size. The best five weighed 4⅛ pounds. The hills first to mature were perhaps the Beauty—the others were not. As between the Ohio and Beauty, therefore, no comparison could be made as to earliness, but the Ohio was a week earlier than any other in the entire plot.

Farm Economy.

A HARVEST HINT.

ALL the boys, both old and young, will appreciate the little drama shown at Figures 355 and 356. Our friend, J. M. Drew, sends us the idea from which our artist made the sketches. A well-filled oil-can is a necessity on all farms where machinery of any kind is to be handled. Oil is a necessary agent in its place, but it is a dirty and slippery article when it is allowed to spread out of its proper boundary. In Figure 355 the boy has been sent to the shop to fill the oil-can. He is in a great hurry, for his father wants to oil up the reaper before

Fig. 355.

Fig. 356.

starting for the field. The boy tries to fill the can from the jug, and the result of this effort is plainly visible. The oil is wasted, and goes dripping all over everything to the immense disgust of all hands. The boy thought the matter over pretty thoroughly, and the result of his thinking is shown at Figure 356. He has taken an old baking-powder can, and with a pair of pinchers made a spout at one side of it. With this arrangement he can fill the oil-can without any danger of wasting the oil or dirtying the floor. No wonder he smiles over his work, and stands up straight in the proud consciousness that he has invented a useful implement. Of the two ways of filling an oil-can, the latter is by far the best. Every farmer in the land will value this "Harvest Hint." Such a use of the baking-powder or tomato-can will save time, patience and oil.

Farm Topics.

CORRESPONDENTS' VIEWS.

MY muskmelons are splendid, and surprise every one who has seen them. I started the seeds in the house in April; then I put the plants in the hot-bed, about the middle of the month, where they remained till the beginning of June. I then transplanted them carefully, and covered them with cotton-covered frames till they were well established, and I did not lose a single one. I am in for all the prizes.

Headingly, Manitoba. E. F.

I LIKE what Mr. Woodward says about feeding cows. I have fed mine regularly, Summer and Winter, and it pays the best kind. It is poor economy to let any animal go without enough to eat. I give a feed consisting of half corn-meal and one-fourth each bran and oil-meal. The cows keep in good flesh, give more butter, and the manure is worth more. The best price I can get on oil-meal in New York is $29 per ton. We are working into Holsteins here. I am having made a husking-jack like the one recently pictured in the RURAL. No more kneeling on the ground for me. W. R. H.

Somerset, Co., N. J.

WE NEED MORE KNOWLEDGE.

We are wont to forget that beneath the growing crop that is waving before our eyes in the summer breezes, lies another crop, its counterpart, without which the first could not exist a single hour. We forget that within the darkness and dampness of the soil a system is in operation, beside which the most wonderful human achievements of hydraulic engineering shrink into nothingness. For

every leaf that plays with the zephyrs, a thousand miniature pumps of marvelous fineness and delicacy are at work to maintain its elasticity and grace. Beneath every full-grown plant that yields its quota to the farmer's crop lies a system of nature's plumbing scarcely less intricate than the human system which underlies New York or London.

When we contemplate these truths, naturally enough we begin to feel a sort of reverence for the soil, and the processes that are going on within it. The advice so often given, to put the cultivator down deep between the rows of corn is not quite so easily followed. We wonder how many tiny service pipes we are severing, and how the loss of sap entailed is going to affect the foliage. We query whether our method of preparation of the soil is the best that it might have been. We would gladly know how we may best resist this wonderful subterranean development.

Farmer A prefers deep plowing. His neighbor B prefers the reverse. C insists on shallow culture for corn, while D. cannot cultivate too deeply. E puts his fertilizer beneath the hill, and F gets better results by putting it above the seed. Are not our rules in agriculture largely empirical or experimental? May it not be truly said that the science of culture is yet in its infancy? Surely we do not know enough yet to attempt to lay down rules that shall apply to all conditions.

Geneva, N. Y. E. S. GOFF.

Dairy Husbandry.

SOUTHERN DAIRYING.

HENRY STEWART.

DAIRYING in the South is at present in a chaotic state; it is without form and void, and darkness is over it. Here and there some bright spots are breaking through the chaos, and nuclei of order and improvement are visible. One of the brightest of these is a Jersey Cattle club of which one of the RURAL subscribers, (Mr. Shuford, of Hickory, N. C.,) is President and for which I recently drew up a constitution and by-laws. Other bright spots are occasional herds of Jersey cattle; improved native stock; the better class of utensils and sweet-flavored butter. These, however, are few and far between and are not sufficient to lighten the general darkness, but serve more to make this more dense by contrast. And yet no other part of the Union has better opportunities for engaging in the dairy business or has a better market. Grass of various kinds, clover, and all sorts of fodder crops, in far greater variety than is known to Nothern dairymen, grow and flourish. The mild Winters in which pasturing is possible with only a few short intervals, make dairying at this season very easy, and then the largest demand of the year exists, for the whole South is then crowded with refugees, as they might be termed, from the Northern cities anxious to escape the rigors of the Northern Winters, and the hotels and boarding houses furnish a most excellent and liberal market; 50 cents a pound can be procured with ease for a fine quality of butter and every condition for the finest quality is afforded.

I am now writing from the center of the great Southern mountain region, where the elevation above sea level is about 4,000 feet. Here there is a magnificent dairy country. A cool summer climate averaging a night temperature of but little over 60° and a day temperature of about 75°; and a winter temperature of over 50;°; with rare and short snowfalls and a warm Southern sun which raises the noon temperature mostly to 65 or even 70 degrees; the fresh and most abundant water from ever-flowing springs and brooks which never freeze or vary from a standard temperature averaging 50 degrees: a soil and climate which produce all the clover and grasses to perfection and to which Red Top and Kentucky Blue Grass seem to be indigenous coming in spontaneouly when the land is cleared, and growing on the mountain tops, on the bald, treeless summits in large meadows, some covering more than 100 or 200 acres; and a rainfall of 60 inches in the year: all these combine to make a paradise for the dairyman who has been wont to struggle with summer heat and drought, and winter frosts, and snows in the North and West. Here mosquitos are unknown, and malaria, the curse of so many otherwise pleasant places, has no abode. What more can a dairyman ask for?

But where nature does the most, men do the least, and it is the rule among Southern farmers—to the manner born—with a very few exceptions, to do as little as they can, and do that little only when they are forced by necessity to do it. Hence the Southern dairy is in a state of chaos from which only Northern dairymen can lift it; and thousands of them, now shrinking with fear from the bugbear of oleomargarine and its numerous kin, might find room in the South, where this enemy could not make them afraid. Winter dairying is the best for the South. The Summer should be devoted to those special crops which are exceedingly profitable when rightly managed, as cotton and tobacco; and to making sufficient hay and corn and curing enough fodder to carry the cows through the short Winters. Pasturing might begin in September when the cows would be coming into milk after running in the woods from May or June; where they find abundant and excellent feeding on the luxuriant undergrowth. By reserving some aftermath of clover, or Orchard Grass, or a Blue Grass pasture for Fall and Winter use, the yard feeding would be very short; indeed it would be lengthened purposely for the object of making as much manure as possible. In places where the Summer lingers in the lap of Winter, silage of the abundant fodder crops, corn, millet, peas, Pearl Millet, Teosinte, Johnson Grass, and many others, with clover, which grows as it is rarely seen in the North, would supply the most liberal feeding where the pastures are barren and parched waiting for the late fall rains to restore their verdure. There is no difficulty of climate to stand in the way that cannot be overcome; no want of fertility in the soil; no want of a market; no trouble to sell the product at good prices; only men are wanted. The harvest is great but the laborers are few, and the dairy in the South is just waiting to be developed.

Macon Co., N. C.

The Poultry Yard.

THE FALL CARE OF POULTRY.

P. H. JACOBS.

AT this season of the year, when prices are usually low, many are prone to look upon the dark side of poultry-keeping, but as such depresssion is caused by a desire to reduce stock, a point is reached late in the year at which shipments become less frequent, and prices for poultry and eggs rise until the hens begin to lay abundantly in the Spring.

Before reducing stock, select all the hens that have moulted or show signs of moulting, as they will complete the process and begin to lay before cold weather comes on. Though the rule may not be infallible, yet the hen or pullet that begins to lay on the approach of Winter will generally make a good winter layer, while the one that does not commence before cold weather usually postpones operations until Spring. The hens intended for market, therefore, should be those that have not moulted, as moulting requires about three months.

Another point is that a moulting hen is usually fat. This is because she stores in her system the fat of the food, while the mineral and nitrogenous elements go to the formation of feathers. Hence, a hen may be very much debilitated by the shedding of new feathers, and yet be very fat. The best food for a moulting hen is oatmeal, with meat and milk, whenever such can be procured. Feed very little corn, as she should not be made very fat.

As the Fall begins to pass over and Winter approaches, by careful management the hens may be made to lay all Winter, and the beginning of the Winter preparation should be made in the Fall. In some sections the season is not very severe until January, and advantage should be taken of the warmer weather. Lice must still be kept down, and the poultry house must be made as comfortable as possible. To get the hens in good laying condition those that are very fat should be separated from the others, and be fed upon oats, as the only food, compelling them to hunt and scratch for the grain in cut straw, leaves, or some kind of litter, as the consequent exertion will reduce them in flesh and keep them in health. As soon as the hens begin to lay, they may be fed well on plenty of food, provided there is a variety, as the production of eggs will enable them to appropriate it to that purpose. Whenever a hen ceases to lay, if even for a few days, she begins to fatten, and this must be guarded against, as a fat female, whether quadruped or birds, is not very prolific.

If soft food is given, it should consist of ground oats three parts, shorts one part, and bran two parts, and if the hens are laying well there should be added one part of corn meal and one of ground meat. Bone-meal, ground shells, and pure water should always be where the fowls can have access to them, and the soft food should be seasoned with salt, scalded, and fed warm. No food will be necessary then until night, when oats and wheat should be given, unless in cold weather, when corn may also be allowed.

Chicks hatched late in the Summer or during the Fall, must be sold whenever cold weather sets in, as they seldom grow after frost. They will remain nearly of the same size all through the Winter, but will grow rapidly on the approach of Spring. Such chicks usually make short-legged, compact-looking fowls, while those hatched in the Spring are taller. It pays to give the late chicks the whole of the warm weather in which to grow and attain all the size possible, but if kept till the end of the year they should be sold about the middle of January, as prices then begin to rise. Good warm quarters have some influence on the growth of chicks and the productiveness of the hens, and as but little can be done in Winter, this is the proper time to build and make preparations.

AUTOMATIC REVERSIBLE FOUNTAIN.

FOWLS are as fond of pure, cool water as human beings, and when it may be provided at so little trouble and expense it is downright cruelty to neglect it. An automatic fountain is not difficult to make, and would prove a boon in every poultry yard. One head is taken out of a keg, a demijohn is placed inside, so that its neck will protrude through a hole bored in the center of the head, and solidly packed in with sawdust. The head is then replaced and the keg hung upon a frame, as shown in the sketch (Fig. 357). A pan is

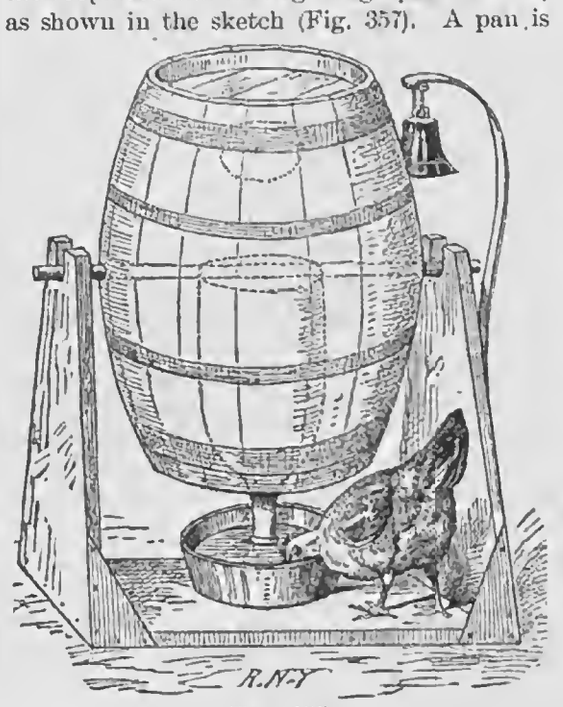

Fig. 357.

placed under the demijohn, so that the former's bottom will be about two inches below the latter's mouth. As the water is taken from the pan by the fowls it will flow in from the demijohn, so that there will always be two inches of water in the pan. The sawdust packing will keep it cool until the last drops flow out. As the keg is being packed with sawdust, a stone a little heavier than the empty demijohn may be placed in the bottom; then, when all the water has run out, the keg will turn over automatically, and may be arranged to ring a bell as it does so. In Winter the demijohn may be filled with *warm* water, and the sawdust packing will keep it warm a long time. A tin can, holding a couple of gallons and shaped something like a demijohn, may be used, and in very cold weather it may be filled with *hot* water without danger of breaking. With such a fountain as this in a poultry-house the fowls will not be apt to suffer for pure drinking water.

Christian Co, Ill. F. GRUNDY.

GAPES IN CHICKENS.—I have had an experience of several years raising chickens—from a score to 300—and sometimes, in a confined space; gapes have appeared, but not with any disastorous results when the following remedy was used:—Feed the flock sparingly, short rations. Keep a shallow dish with cracked corn, and over this corn pour a little turpentine; the chickens will go for this dish and take the corn, not with particular relish, but they will soon lose the gapes. B. H.

Field Crops.

PROFITABLE WHEAT ECONOMY.

WALDO F. BROWN.

WITH wheat selling at present prices no farmer can afford to grow a poor crop, and every wheat grower should determine to select such soil, and so thoroughly prepare it, that he may reasonably expect from 20 to 30 bushels per acre. This ought not to be difficult on good wheat land provided the proper conditions of soil are obtained. By far the most important point under the control of the farmer is the preparation of the seed-bed, and often ten bushels to the acre can be added to the crop by attention to this alone. The best seed-bed is one mellow at the surface, but compact below. This seed-bed is most easily secured by early plowing and frequent workings of the soil. These workings should follow every rain, as soon as the land is dry enough, and should be shallow. There is no better implement for this than an Acme harrow, but judgment must be used, and the implement selected must be the best suited to the condition of soil. Sometimes a roller or a heavy plank drag will do the best work; but the object should be to keep the surface fine and mellow so as to retain the moisture, and induce chemical action which will render the plant food in the soil quickly available. If for any reason plowing must be deferred until near seeding time, it should always be shallow—from four to five inches—and the roller should immediately follow the plow, so as to compact and pulverize the soil before it dries. Why do I lay so much stress on a compact, mellow seed-bed, do you ask? Because, first, I have seen many failures of the crop from sowing at once on a deeply plowed mellow field. The loose, porous soil holds too much water, and does not anchor the roots firmly, and the soil is not aerated and disintegrated so as to give up readily the plant food so necessary to give the plant vitality to endure the Winter and enable it to develop enough of blade to protect the roots, and enough of root to maintain its hold on the soil and resist the lifting process caused by the alternations of freezing and thawing, which kill the feeble plant. I have said nothing about fertilizers; but would advise that all the animal or barn-yard manure at command, be thoroughly fined and mixed, and used as a top-dressing after the land is plowed, and that it be thoroughly mixed with the surface soil by subsequent harrowing. Many years of experience have led me to believe that wheat sown early, on a well prepared soil, requires but one bushel of seed to the acre to produce all that the land is capable of; but I have hesitated to recommend this amount, because at some of the experiment stations the experimental plots seemed to show that six or seven pecks gave a greater profit; but in the report for 1885, Professor Lazenby, the Director of the Ohio Experiment Station, says: "From previous tests we should unhesitatingly say that four pecks of seed is a sufficient quantity per acre, *if the soil is in proper condition* and there are no exceptional climatic conditions." (The italics are mine.)

In regard to varieties, I recommend always that each should sow such as are tested in his locality. With me the Fultz and Diehl- Mediterranean have given the best satisfaction. As a rule, early sowing is best, but I would rather defer sowing two weeks than to put the seed in a badly prepared seed bed, and I would not sow while the mercury is much above 80 degrees, or in a very dry soil, as these conditions are favorable to insect enemies. I prefer to seed after rather than before a rain, which will pack the soil and form a hard crust. Following as nearly as possible these rules, I have been fairly successful as a wheat grower.

Pomological.

STAMINATES AND PISTILLATES.

PERHAPS no subject will, in the near future, assume more importance to nurserymen and fruit-growers than that which heads this article. The question of the perfect and imperfect blossoms is, as yet, but little understood. There are comparatively few engaged in horticultural pursuits familiar with the office performed by pollen in the production of fruit. Here is a field for practical investigation. We have barren plants, barren vines and barren trees. Is it because the blossom is imperfect or not? The strawberry is catalogued as staminate or pistillate, having a perfect or imperfect bloom. There are some raspberries which are said to be better than others when planted near others better supplied with pollen. [There is no doubt about it, and the same may be said of certain blackberries.—EDS.]

But how is it with orchard fruit trees, grape-vines and other kinds of fruit? [The same unquestionably as to certain varieties.—EDS.]

Mr. D. B. Wier, a prominent horticulturist, of Lacon, Ill., contributed some well-written papers to a Western agricultural paper, last Winter, on our "Native Plums." He states that the Wild Goose Plum has an imperfect blossom, and that unless it is planted near some other kind having a perfect blossom, is unproductive. He is evidently correct. I have an orchard of 800 large Wild Goose Plum trees, capable of yielding at least 4,000 bushels of fruit. I got only about 200 bushels this year. On the southwest side of this orchard there are a few rows of Amsden peach trees, and just beyond the peach trees is an apple and pear orchard belonging to a neighbor.

Five or six years ago when this peach

orchard was young and thrifty, and bore full crops of peaches, there was a full crop of plums. Whenever the peaches were killed in the bud and failed to bloom, the crop of plums was small. This year there were no peach blooms, all being killed in bud last Winter, and the crop of plums was very small. A few rows of plum trees next to the peach orchard and nearest to the apple and pear orchard, had more fruit on them than any other part of the orchard. They were doubtless [? Eds.] fertilized by the pollen from the apple and pear trees. I have another plum orchard of 100 trees completely surrounded by peach trees. Last year the peach orchard bore a nice crop of fruit, and the plum trees were loaded with plums. This year there were no peach blooms, and not a peck of plums on the 100 trees. The Wild Goose plum has never failed to bloom in the spring with me, though the thermometer registered 24 degrees below zero the preceding Winter.

The above observations lead me to believe that the Wild Goose Plum has an imperfect blossom, and needs a supply of pollen from some other source to produce a crop of fruit. The peach tree would be an excellent help for this purpose were it not for the fact that the peach-bud is killed when the mercury drops to 16 degrees below zero, while the plum-bud is not.

Mr. Wier recommends planting several varieties of plums together, and claims that the Miner Plum fertilizes the Wild Goose perfectly. It would be truly gratifying to many of the RURAL readers if the intelligent, practical horticulturists of the country would take up this subject and analyze it in all its bearings. Thousands of dollars have been paid out for barren nursery stock by parties ignorant of this subject, and ninety-nine one-hundredths of all such purchasers are ignorant of it. The nurseryman of the future must label his fruit trees, vines and plants as perfect or pistillate. If the latter, he must state the variety to plant with it to supply pollen.

Near the southeast corner of my large plum orchard are two or three large red elm trees, which were in full bloom at the time the plums blossomed. A few trees in this corner of the orchard were full of plums. Did the elm trees furnish the pollen? There was nothing else in bloom near the orchard that could have done so. A. R. C.

Princeton, Ky.

No, it would be impossible so far as is at present known. Neither could an apple fertilize a plum or peach. That a peach may fertilize a plum or *vice versa* is very probable. Prunus Simonii seems to be as much peach as plum. We urge our friend to unite with us in condemning the word "staminate" as it is sometimes used to express a *perfect* flowering variety; that is, one bearing *both* pistils and and stamens. The word should never be used in that sense. We have staminate species and varieties as, *e. g.*, asparagus, ailanthus and a multitude of others. These are properly "staminates." We have others, like the corn plant, chestnut, maple, pines, spruces, etc., that bear their male and female flowers separately, though on the same plant. Then we have another class of plants bearing perfect flowers, that is, flowers having both sets of organs in the *same* flower. This is just the case with what some call "staminate" strawberry flowers. It must appear therefore to all who desire that words should have definite meanings that to use the word "staminate" for "perfect" is misleading and altogether objectionable.—EDS.]

THE SCARLET CRANBERRY APPLE.

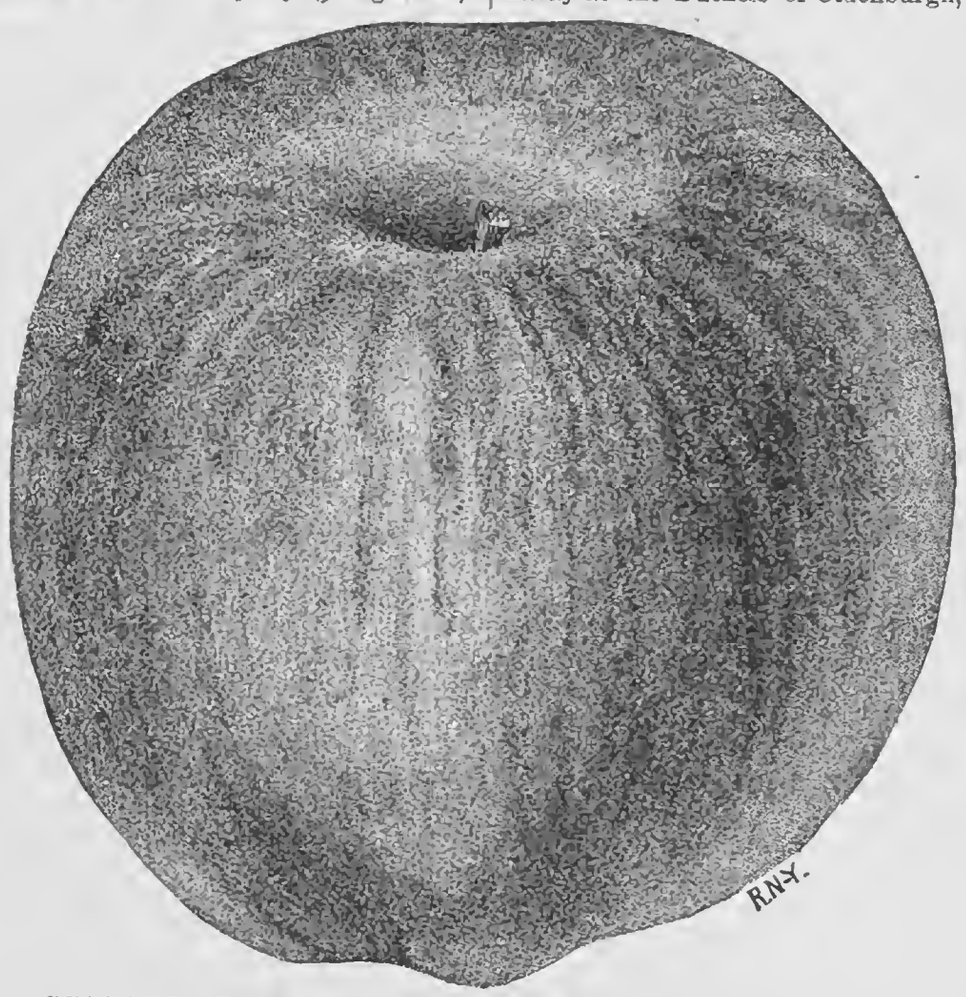
THE Scarlet Cranberry Apple, a specimen of which is shown at Fig. 358, with cross-section at Fig. 359, originated in Scott Co., Virginia, some score or more years ago, from seeds of an unknown variety. It is a very vigorous grower. The branches are very stout, often being at the ends of the twigs as large as a man's finger. It is an upright grower and is wonderfully productive, bearing full from top to bottom. Notwithstanding the great size of the fruit, they hang tenaciously to the large limbs and resist strong winds. The apples were sent to us and the above facts furnished by Mr. Geo. W. Robinett, of Pattonsville, Scott Co., Va. Our own notes taken at the time the apple was received, read as follows:

Very large, ovoid, conical, flat across the stem end; considerably ribbed, excessively so on the eye end; stem very long, 1¼ inch, slender planted in a narrow, very deep cavity; a little irregular and entirely covered with russet, which extends in irregular rays considerably out over the rim. Calyx rather small, closed in a narrow, moderately deep and much corrugated basin. Color: groundwork of pale yellow, completely overspread with a spatter of red, and much splashed with irregular stripes of deep carmine red, running much deeper toward the stem end. Cross-section: core small and well filled with seeds, many of which are imperfect; the seeds are small, short and thick. Flesh firm, fine-grained, dry, sub-acid, and though not high-flavor, quite meaty and of great consistency. Color white. Liable to be too dry and mealy when a little over-kept. A large, handsome and showy apple.

THE TETOFSKY AS A STOCK.

T. H. HOSKINS, M. D.

THE Tetofsky Apple was one of the first Russians introduced into the United States, it coming about the same time as the Alexander, Duchess of Oldenburgh and Red Astrachan. It is peculiar for its very upright growth,



SCARLET CRANBERRY APPLE. (From Nature.) Fig. 358.

stiff branches, and the habit of bearing its fruit on spurs, much like a pear. The fruit is of medium size, oblate-conic, ribbed, whitish-yellow in color, with carmine stripes; flesh firm, and of mild subacid flavor. On some soils and in some localities it is a shy, uncertain bearer, but in others it fruits profusely; yet, owing to its clustering habit and very short stems, most of the fruit is forced off by its growth, so that very little hangs until maturity. Its season in Northern Vermont is August, a little later than that of the Yellow Transparent, which has entirely superseded it as a market apple.

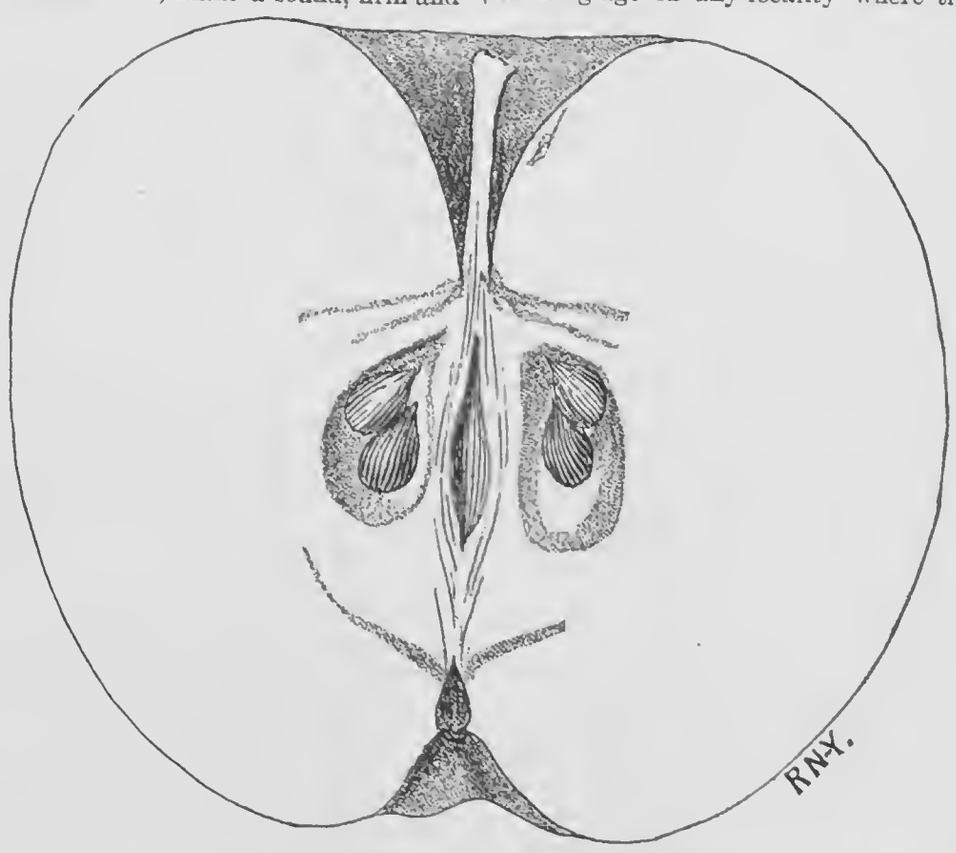
This last-named fact has been the means of teaching me the very great merit of the Tetofsky as a stock. A great many varieties (all that I have tried) make a sound, firm and lasting union with it, without any marked enlargement at the point of junction. The growth of cions upon it is healthy and vigorous, without being excessive. I find it just the thing to top-graft the semi-ironclad varieties upon. Without Tetofsky stocks I could not make the Fameuse a profitable apple. It is also an admirable stock for varieties that may be hardy against cold, but are subject to bark-bursting, either near the ground or higher on the trunk, and it has the great merit of bringing tardy bearers to time, and of making shy bearers productive.

The Prolific Sweeting is the best fall iron-clad of that class I know, but it comes very late to bearing, and I could not see where the prolificacy came in, until I top-grafted it on Tetofsky, where it bears heavily. Alexander is rather tender here, but perfectly satisfactory on Tetofsky, and a long list of this sort might be given, while the Foundling, one of our best late fall apples, but very subject to bark-rupture is safe from this on a Tetofsky stock. Nurserymen who have an over-stock of Tetofsky should avail themselves of this knowledge.

THE MANN APPLE.

I THINK it due to the public that the claim advanced for the Mann Apple, that it is as hardy as the Duchess of Oldenburgh, should be emphatically and widely contradicted. I do not say that its introducers are willful deceivers in making this claim for it, yet they should by this time know from the proceedings of the various horticultural organizations and the reports of individual fruit-growers and nurserymen in the "cold North," that the Mann apple is in no sense an "iron-clad" tree. It is considerably less hardy than Fameuse, which is far from being iron-clad. It is not so hardy as Westfield Seek-no-Further, Blue Pearmain or Tolman Sweet, all three of which are so lacking in hardiness as to be unprofitable in my grounds. In fact, there has not been one Winter of the last six when the Mann has not been badly injured in this section, and there is no likelihood that it can be brought to bearing age in any locality where trees approaching the character of an "iron-clad" are required. If my testimony on this point is not sufficient, it will, I feel sure, be sustained all through the cold North by men like Prof. Budd, of Iowa, A. W. Sias, of Southern Minnesota, A. G. Tuttle or H. H. Howlett, of Baraboo, Wis., Charles Gibb, of the Province on Quebec, and by many in Northern Maine.

Orleans Co., Vt.



SCARLET CRANBERRY APPLE. (Half Section.) Fig. 359.

We have received from a friend in Washington Territory, three Prunes d'Agen weighing 12½ ounces of delicious quality.

Arboricultural.

SIBERIAN STONE PINE.

PROF. J. L. BUDD.

THIS differs from our Swiss Stone Pine about as widely as does the White from the Norway Spruce. It is nearly as light-colored in foliage as our White Pine, and quite as graceful in expression, though denser and more compact in habit. It makes a free, rapid growth on the rich steppes of Russia, east of the Volga, and as far north as Moscow, and attains large size where the slower-growing Swiss Stone Pine utterly fails. Its timber is fine-grained, soft and peculiarly fragrant. It is almost exclusively used for the delicate, carved work sold at Moscow, Kiev, and other sacred places of the Greek Church, and for the rich carving of the interior of cathedrals. The nuts are edible and in quality compare favorably with our beech-nuts.

On our rich, dark-colored prairie soils, and in our changeable Summer air, our common conifers are difficult to start from seed with the best known care and arrangements for shading, while the nuts of this Stone Pine germinate as readily as corn, and the plants do not seem liable to damping off or burning, even when exposed to the sun.

Their ability to stand intense drought and heat has been well tested this Summer. Three-year-old plants, in bed, have been exposed to the heat and desert air of the past eleven rainless weeks which, for the first time in the history of prairie development, have shriveled and dried up our early planted corn, yet no leaf of the Siberian Pine has flagged, and the trees have made a growth of several inches, and seem to be still growing, when such trees as the White Willow and Box Elder are dropping their golden foliage as in Autumn.

The object of this note is to direct the attention of propagators to what seems to be a peculiarly valuable tree for Western planting. Its seeds can be obtained in any desired quantity of Carl Wagner, Riga, Russia, or can be ordered through Vilmorin, Andrieux & Co., of Paris.

Ag'l Coll., Ames, Iowa.

THE JAPAN CHESTNUT IN FLORIDA.

EVERYTHING in the shape of trees and shrubs coming from Japan seems to do remarkably well here. My Japan chestnuts are growing finely; but those I grafted on native stock are out-growing the trees bought and set at the same time. They all seem to grow more like a bush than a tree. Last February I put in four grafts of the Kelsey Japan Plum, in a common wild plum (set three years) near the ground. To-day (August 20th) I carefully measured the main shoots and laterals. The combined length is 382 feet four inches—longest shoot eight feet four inches. The largest measures 6¾ inches in circumference. The combined length of the best graft is 160 feet. It still seems cheerful and looks as though its task for the season was not nearly completed. J. M. M.

Green Cove Spring, Fla.

Horticultural.

TOO MANY NEW STRAWBERRIES.

THERE are too many new and often poor strawberries thrown upon the public. Too many want to get rich selling plants to the credulous public. I am heartily glad to hear of a "commission appointed to examine and report on all *new* fruits." If this is done it will save the country thousands, besides preventing the land from being over-run with trash. How many new and worthless fruits flood the realms of Pomona? All for money! Now, no one berry or fruit can be expected to suit the whole of our vast domain. Hence, some will say, "the only way for us to do is to try all newcomers." But suppose a commission tries them and proves they are worthy. We then are less liable to be imposed on than if there had been no trial or proof of their worth or worthlessness. If a disinterested commission at some of our agricultural colleges would prove the value of all fruits, before they are sent out, it would be of immense benefit to the fruit growers. Some proof, however, is better than none. One will say, "the originators prove their fruits." Yes; but they are directly interested; hence a trifle liable to err. The RURAL has been of much benefit by its impartial criticism on fruits. Yet it has been blamed for that very impartiality. A commission would doubtless meet with the same treatment. Still, I am in favor of one as I think good would result. "Go slow" in buying new things. A. F. D.

Croston, Oregon.

What Others Say

A VISIT OF THE FARM EDITOR OF THE N. Y. WORLD TO THE RURAL GROUNDS.

THOSE WHEAT AND RYE HYBRIDS.—L. C. Benedict, the painstaking agricultural editor of the New York World, visited the Rural Grounds a few weeks ago. The following report of the visit is taken, word for word, from a late issue of that journal:

"The wheat and rye hybrids produced on the experimental grounds of the RURAL NEW-YORKER, and about which World readers have already had two illustrated descriptions, continue to attract widespread attention and no little controversy among the scientists of the country.

July 13 a visit was made to the Rural Grounds to see the twentieth-of-an-acre plot, which has been characterized as bearing plants that most resembled rye. All the plants thereon have sprung from one seed, as stated in the weekly World, Feb. 24. This one seed gave a plant bearing twenty-two heads in which only a few shriveled kernels were found and the plot above alluded to is the second year's increase from those shriveled kernels. Of all the rye-wheat hybrids this twentieth acre has proven the most interesting. At the time of our visit of inspection we might have selected no fewer than fifty different heads as distinct from each other as are any of the wheats in cultivation.

Some of the plants were dwarfs, not over two and one-half feet high, with culms thrice as heavy as any ever seen in the pure wheats. Heads seven inches long were not uncommon. Some were bearded as heavily as buckwheat; others were beardless and still others showed every intermediate stage. Some were club-headed, with breasts or spikelets densely crowded towards the top. Some bore compound spikelets; that is, two breasts growing instead of one, and the head partially double-breasted on each side of the rachis. Some heads were shapely, others twisted with long, curly awns and culms as crooked as the heads. Some heads were larger and contained more kernels than any wheats we have ever seen growing in this climate. Others were feeble, narrow heads, scarcely two inches long. The straws were of all colors, from yellow to dark purple. They were of all thicknesses, from the size of rye to that of a small slate pencil. Some were densely downy, others smooth. Some were wiry and strong, others weak.

These plants were maturing variously, some with rye, some with wheat, while many were still perfectly green, with a good promise of not ripening at all. These strange plants, all from one seed, vary so remarkably, are so entirely different from either wheat or rye, that nothing short of seeing them can give the reader a good idea of them or enable authorities on grasses to intelligently consider the matter.

We pass now to the three-fourths rye plants, seeds of which were planted last Fall, having been produced by again crossing the half-rye plants by the application of rye pollen. About a dozen plants grew, every one of which is different from the others, and three of which, bearing from fifteen to twenty heads each, are evidently sterile. It is to be hoped that a few seeds may be found in these heads, as thus far it is only from them that any progress towards rye has been made. One of these sterile plants was the tallest of any plants in the several plots by six inches. The culms are as slender as rye culms, but in color a very dark purple, nearly black. Seven heads of the three-quarter rye plants were again this Summer emasculated and treated to rye pollen. If any kernels result their parentage will be seven-eighths rye. All will be again carefully planted, one kernel a foot apart each way, and will, it is hoped, result in further remarkable departures next Summer.

If by this continued use of rye pollen upon successive progenies, the first mother of which was Armstrong Wheat, real rye plants are again produced, it will prove a most interesting and instructive fact, especially to botanical science. One cannot, however, examine this varied collection of hybrids without being impressed that the immense culms and heavy heads of many plants will find a welcome place in the future cereal husbandry of the country.

"FERTILIZERS FOR WORN-OUT SOILS.—The hybrids above considered are the results of only one of many experiments conducted by the Editor of the RURAL NEW-YORKER in the interests of progressive agriculture and science. The Rural Grounds is one of the foremost practical agricultural stations of the land, and abounds in valuable lessons to farmers. Following are a few items of interest gleaned during our recent hurried visit:

Potato fertilizer experiments made on poor, impoverished soil produced results that prove the folly of bestowing on land which requires all three of the essential plant foods, any one or even two of them. A profitable yield is gained only where a *complete* fertilizer was given. Animal manures are complete fertilizers in the sense of containing all the elements of plant foods. A "complete" fertilizer among commercial or artificial fertilizers is one that possesses more or less of nitrogen, phosphoric acid and potash. It may be worth $50 or $5 a ton, according to the quantity of these three foods it contains in available form. In Mr. Carman's experiments chemical fertilizers were used. Lime, ashes, sulphate and muriate of potash, kainit, nitrogen, etc., plaster, bone, etc., were applied separately without material increase of yield over unmanured plots. The effect of any two was much the same. It was only on those plots where bone, potash and nitrogen were all used that the yields were increased.

"IMPROVING CORN BY SELECTION.—An interesting plot that demonstrated what each farmer may do for himself in the way of improvement in corn gave the results of ten years' selection. The variety originally was Tennessee Prolific, which during the second year of trial was crossed with heavy white dent. Ten years ago it grew ten and eleven feet high, suckered badly and bore small ears. Every year small plots have been planted and seed selected from only the most perfect plants. The tassels of all faulty plants were cut off. The results, as seen recently, of this ten years' improvement by selection are: It is two weeks earlier, there are few suckers; the ears are often four and five to a stalk, are borne lower, and the plants average not over eight to nine feet high in good soil.

"EARLINESS OF THE EARLY OHIO POTATO.—The earliness of the Early Ohio potato is a subject of some discussion, as is also the fickleness of its yield. In some localities it is the earliest sort known, and yields well; in others the yield is poor. A peculiarity of this variety everywhere is smallness of the tops, and they hardly ever bloom. On the Rural Grounds Early Ohio and Beauty of Hebron were planted side by side. July 13 the vines of Early Ohio were nearly all dead, while those of Beauty of Hebron showed no signs of changing. Judging from the raised, cracked soil and one hill opened for inspection, the yield will be heavy; but then this was in extremely rich soil that had not been subjected to drought. Early Ohio was the earliest of sixty-one varieties under trial.

"RASPBERRY AND BLACKBERRY CROSS.—Prof. Saunders, of Canada, and perhaps others, have effected a cross between raspberries and blackberries, but the results are not known. It appears from Mr. Carman's experiments in this direction that the cross is a simple one to make. Both the raspberry and blackberry buds were opened and the anthers removed while green. Pollen from each was applied to the other, and carefully wrapped up in tissue paper to prevent contact of pollen from bees or wind. About fifteen berries formed from this hybridization, three-fourths on the raspberry and the remainder on the blackberry. The seeds of the raspberry have already been sown, and those of the blackberries are to be planted when ripe.

"THE JAPAN CHESTNUT.—The Japan chestnut which owes its introduction in this country to an accident, has proven in New Jersey to be as hardy as the American chestnut. Some trees will bear when three years from seed, and there appears to be no difficulty in transplanting the seedlings. Owing to its short joints and shrub-like tendency of growth the Japan chestnut is peculiarly adapted as an ornamental tree for lawns; it is also of value for its fruit, which, while not of as good quality as the American chestnut, is better than that of the Spanish nut. On the Rural Grounds were seen seedlings one foot high from seeds that had been planted this spring.

"PEAS WILL NOT MIX.—Farmers, many of them, believe that different varieties of peas will cross if planted in close proximity. This is not the case, for the ovules of each flower are fertilized by the pollen of the same flower long before the buds unfold. Therefore, in crossing peas, the anthers must be removed just as soon as the petals show themselves in the bud. If one waits beyond this period, it will be found, on opening the bud, that the anthers are ripe and have shed their pollen upon the stigma. It is impracticable to unfold a bud so small and immature, and therefore many have concluded that peas could not be crossed even artificially. This difficulty is obviated, however, by cutting off the tip of the bud as soon as it appears, and slitting down the flower a short distance; the ten anthers are then easily removed, leaving only the stigma, which may now receive pollen of any other variety with which it is to be crossed.

"WELCOME OAT UNDER MANY NAMES.—Trial plots devoted to oats make it appear that "Welcome" is really the "White Australian" introduced by ex-Commissioner Le Duc while in office; but then again it is not Australian, because Australia is not an oat country. "Dakota Chieftain," "Clydesdale," "White Belgian," "Race Horse," are all really "Welcome" or "White Australian." So, likewise, are the new "Yankee Prolific," the "Russian White," or "White Russian."

"THE BLUSH POTATO.—The Blush Potato, introduced by the RURAL NEW-YORKER four years ago, has proven all that was claimed for it. It is of the Peachblow kind, but one of the heaviest of yielders, and in quality as good as any Peachblow. It is a late sort, and one of the best of keepers. Its one failing is that it straggles in the hill, thereby rendering it more difficult to harvest than some other kinds."

FEEDING APPLES TO COWS.—Owing to the tendency of cows to over-eat when they can get food which they like and to which they are unaccustomed, the Natural Live Stock Journal thinks that probably there is nothing more dangerous for them to help themselves to than apples, yet they readily become accustomed to them, so that they can be as safely trusted in an orchard as a sheep or horse. They should be fed moderately at first, and the quantity be gradually increased till, at length, they learn to measure the quantity their stomachs can manage.

Apples are a dainty bit for cows, and when fed judiciously, are a healthful and excellent milk-producing food, and as safe as any other. The great danger in the case of bovines over that of other animals, comes in part from an extraordinary development of the rumen by habitually overcrowding it with coarse herbaceous food in the effort to furnish the means for supplying the demands of abnormally active udders. The rumen becomes stretched to such a capacity that it will hold more concentrated food than can be digested before fermentation becomes active enough to prove detrimental, if not fatal; and the animals are not able, until educated by experience, to discriminate in the use of coarse and concentrated foods. Non-ruminants have no such organ for hastily taking in a store of food to be afterwards worked over, and hence are not so likely to be led into overloading; nor do ewes, which have a drain through their udders very much inferior in proportion to cows, feel such a strain upon their appetites as to induce an over-distension of the rumen, but would in all probability do so with a corresponding development of milking capacity, since they are also ruminants and have analogous stomachs.

HEREFORDS AS BUTCHERS' STOCK.—An important characteristic in Hereford cattle is that they carry flesh most heavily on the parts of the frame from which the best meat is cut. Their broad backs are usually loaded with meat of the very finest quality, and the average Hereford carcass is found to have its fat and lean mixed in the most admirable manner. Butchers and consumers alike hold Hereford beef in high esteem in England. Indeed, the grass-fed Hereford beef enjoys quite an enviable reputation, and brings top figures in the best markets of that country, as we are told by Farm and Home. The perfect mixing of Hereford beef has been notorious for generations, and has frequently been illustrated both by brush and pen. The proportion of lean to fat is exceptionally large, and the whole is juicy, tender, and choicely flavored.

THE LATEST AND BRIEFEST.

THE New York Times says that "the purpose of most of the agricultural schools is not so much to make farmers as to make teachers of the art, but it seems to a practical man that the best kind of a teacher is one that can first show a young man how to use the plow and harrow by explaining to him the principles upon which they are constructed and work, and teaching him how to handle them. This should come before the study of chemistry, or at least be held equally important with it." By all means. But it strikes us that a young man should know how to plow, harrow, hoe, etc., before entering an agricultural college, as an elementary education necessary to pass an examination.....

THE hams which won the first of four premiums, offered for the best cured hams by the Maryland Agricultural Society, were cured as follows: For every 100 pounds of meat take 8 pounds of the best pork salt, 2 ounces of saltpeter, 2 pounds brown sugar, 1¼ ounce of potash and 4 gallons of water. Mix them and pour over the hams after they have lain in the tub 2 days, having been rubbed with fine salt when put in. Let them remain in this pickle for 6 weeks; then let them dry several days before smoking.....

PUCK (the illustrated comic journal) says that the man who labors with his hands has a way of arrogating to himself all the dignity of labor. He calls himself a workingman, and denies that title to the men who labor with their brains. He will not recognize as a fellow-laborer the accountant, the editor, the artist, the inventor. He never thinks that such men may work as hard as he does, *must* work as hard as he does to get on in the world, and to make their living.....

Everywhere.

RURAL SPECIAL REPORTS.

Delaware.

CAMDEN, Kent Co., Aug. 31.—Lately I have done a good deal of traveling through the New Jersey, Delaware and Maryland peach region. Only a few of the evaporators in the Delaware and Maryland peach region were run before the first part of this week, as the excess of rain during the first part of the fruit season made the peaches of poor quality for canning. Lately there has been a good spell of dry weather, however. A basket of peaches should yield, if Oldmixons in prime condition, upwards of seven pounds of evaporated fruit, but this season only from two to three pounds have been secured from a basket. Consequently the cost has been too great for the business to be profitable. The opportunity on the peninsula for evaporating white or red fruit has passed, but the dry weather if it continues will cause the Smocks, the yellow peaches generally used for that purpose, to be in prime condition, and the evaporators may secure the usual supply. White or red evaporating fruit will probably be scarce excepting for unpeeled fruit, and that will probably be abundant. There may be a few Smocks ready for market this week from Lower Maryland, but there will be an abundance of them next week. This is the most desirable yellow peach for canning and preserving, and housekeepers will do well to bear this in mind and be prepared by next week. The season will be a short one, and there will be but very few peaches from Delaware after Sept. 10. H. R. S.

Illinois.

CHICAGO, Cook Co., August 24.—During the last seven days we have been drifting again into very hot weather, and advices from the West indicate that the recurrence is not local. The late rains, however, have been very beneficial. In many localities where corn two weeks ago did not promise anything, a half crop at least now seems very probable. Another favorable change is the revival of vast areas of pasturage, so important for stock feeding. Fall pasturage in the West is greatly relied upon for the fitting and preparation of stock for winter feeding. The long, dry weather had completely exhausted the fields, and they were totally destitute of the slightest sign of life or vegetation, but a favorable change is plainly visible to-day everywhere from the lakes to the Mississippi River. The reports on spring wheat have been very conflicting, but the burden of the evidence increases to the effect that in many areas of Minnesota, where forty days ago the crop was reported to be a failure, a very fair yield of spring wheat is now being thrashed out. Good progress has been made with plowing for wheat in Ohio and Indiana, and we expect to see seeding of winter wheat in these States soon commenced. The movement of winter wheat still continues very fair. Farmers lost very heavily last season on their wheat, where they had any, by holding for higher prices. But this season there does not seem to be any disposition either in the spring or winter wheat belts to hold for an advance, but to sell as the necessities of the case require. One good general rain (which we have not yet had) would put everything in the farming world in excellent shape for fall work. The rains have come during the last two or three weeks only in areas, and were confined more or less to States. I do not think that during the last forty or fifty days Illinois received any rain which would cover the State as a whole during a consecutive period of twenty-four hours, and this is one reason why the reports on the corn situation have been of such an irregular character. W. H. L.

Massachusetts.

WOLLASTON, Norfolk Co., August 24.—Grapes almost a failure on account of mildew; none escaped. Pears very light owing to frost about the time of blossoming. As a general thing, in most other sections of Eastern Massachusetts, the crop will be good. Apples plenty, the ravages of the canker-worm not so apparent as in previous years. Plums a fair crop. Peaches—none—trees dead or dying. Tomatoes very late and inclined to rot before ripening. J. N. R.

New York.

MIDDLETOWN, Orange Co., August 31.—The

onion growers of this section are harvesting the scanty crop which has escaped the ravages of their old enemy the cut-worm and of the new pest which first appeared last year, the onion weevil. The two largest onion fields of the district are the Graycourt Meadows, near the Erie railway station of that name, and the Black Dirt Meadows on the right bank of the Walkill. In ordinary seasons the 1,000 acres planted with the root at Graycourt and the 1,500 acres planted on the Walkill yield a crop of about 500,000 bushels. Owing to the destructive work of the insects the crop this season will fall short of 200,000 bushels. The onions sent to market this season are unusually fine, of large size and fully ripened. Formerly the growers vied with each other in supplying the early market at high prices, and frequently shipped the tubers in an unripe state. Of late Bermuda and Southern onions monopolize the early markets, and our growers have abandoned the early for the late fall and winter trade. They find that their product, fully matured, has superior keeping qualities and brings a better late season price than the Southern article. Prices opened this season for the crop raised in this quarter at $1.75 to $2 per barrel. Later quotations are $1.50, with a declining market. Those who stored their crops last year for the winter trade made a good thing by it on an advance in prices, and many of the larger growers will adopt a like policy this season. G. G. S.

PORT JERVIS, Orange Co., Aug. 26.—It is estimated that the yield of huckleberries of all varieties for the season about closing, in the famous berry regions of Northern Pennsylvania and Southern New York, within a distance of 150 miles of New York City, is not less than 150,000 bushels, nearly half of which were shipped to the New York market. Philadelphia took over 25,000 bushels, and the rest went to supply the local demand and the markets. Out of the grand total of huckleberries, 20 bushels of white huckleberries were picked. This is a rare berry, only two localities being known where it may be found. One of these is a small spot in Sussex County, N. J., where a few quarts are picked. The only other locality where white huckleberries grow, and the one spot where they are found in any quantity, is on the East Knob, Blooming Grove Township, Pike County, Pa. The 20 bushels mentioned were picked there, and were sold for $4.80 a bushel. These berries are a creamy white, and very sweet. The average price obtained by huckleberry pickers this season was six cents a quart, making a sum of nearly $300,000, which was distributed among them in the region which includes Ulster, Orange, and Sullivan Counties, in this State, and Pike, Monroe, Lackawanna, Luzerne, and Wayne, in Pennsylvania. The profits of the dealers amounted to as much more. N. S. T.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

WHAT WAS THE MATTER WITH THE BUTTER.

J. G. B., Ashtabula, Ohio.—Last week, the cellar was undergoing repairs, I set 45 or 50 pounds of fine roll (fresh-made) butter in our house refrigerator. When taken out, ten days later, it was really frowy. There was nothing in the box but butter and ice, and I am certain the butter was as good as is made, when put in. Could the ice have caused the mischief? I contemplate building a cooler this Fall, 12x12x16 feet high, with ice overhead. Will the space of 12x12x9 feet hold sufficient ice to last the season? What will ice weigh per cubic foot? Can one construct a building so as to be sufficiently cool to keep butter well during hot weather without the use of ice, and how should it be made?

ANS.—There is nothing about ice made from pure, cold water that will injure butter cooled by it, or even in contact with it, so long as it is so kept; but when butter is so kept and then allowed to rise in temperature it soon goes off flavor. It is impossible to tell definitely what caused our correspondent's butter to become frowy. It might have been the result of germs that got into the milk and cream from a foul atmosphere before churning, or even into the butter while being handled and exposed to the atmosphere. The hot weather was favorable to the development of bacteria and all sorts of microbes which, if once in the butter, would soon cause decomposition to set in. But without investigation and a thorough knowledge of all the conditions and surroundings we cannot say positively what caused the trouble. In addition to the possible causes already indicated, poor salt or imperfect salting may have had something to do with the frowing of the butter as there might have been too much water in the butter when the salt was applied, and in consequence only a weak brine was produced, leaving the butter salted too little, and that little with a brine too weak to check decomposition in the nitrogenous elements in the butter, even at a low temperature; or there might be ingredients in a poor salt that would hasten decomposition. This is often the case with the cheap salts, which may run tolerably pure for a while, and then a batch be struck that will spoil everything that it is used in. Such salt is unreliable, and it is risky to use it. An ice-house, of the dimensions named, will hold a good deal of ice, but we cannot say whether it will hold enough without knowing how much our correspondent needs. A building with double walls can be so constructed as to keep butter very well without ice. It is better, however, to so build it that cool air from the ice-house can be let into it. A cubic foot of ice will average about 57¾ pounds, according to solidity. If porous and snowy, it will weigh less. As a further basis for calculation, we will add that a gallon of water will average about 8⅓ pounds, and there are 231 cubic inches in a gallon.

GROUND BONE; SUPERPHOSPHATE; BURNT OYSTER SHELLS.

Subscriber (address withheld.)—I am grinding bones and selling the dust to my neighbors. I steam the bones, and as soon as they are dry they are run through a power crusher, and are then considered ready for application as a fertilizer. Does the steaming deprive them of much of their fertilizing value? Would it be better to grind them without steaming? What is dissolved bone? How much bone heated with vitriol should be used per acre in seeding down? How are bones dissolved? How much superphosphate will a ton of ground bone make? Should anything be put with clear bone dust before it is used as a fertilizer? Would oyster shells burnt and then ground, be of much account for application to land.

ANS.—Bones are ground more readily after having been steamed, as steaming renders them brittle. The steaming takes out the fat, and, if long continued, some of the gelatine. The gelatine contains the nitrogen of the bones, which is the most valuable portion of the fertilizing matter. Bone contains, when dry, about 45 per cent. of organic matter, which has very nearly the composition of wool, hair and horn, and is rich in nitrogen; the 55 per cent. remaining consists of phosphate of lime with a little carbonate of lime, magnesia, soda and potash. All this earthy matter is not affected by boiling, it is the organic part which is partly dissolved, and, of course, lost in the cleaning. The liquid from the steamed bones makes a valuable fertilizer. Steamed bones, however, decay sooner in the soil and consequently have a more active effect than fresh bones. On the whole, the small loss resulting from moderate steaming is balanced by the cheaper grinding. Dissolved bone is bone which is treated with sulphuric acid, and is thus made into superphosphate of lime. In this condition the phosphoric acid of the bone is soluble, and the effect is immediate; while that of ground bone is more lasting. Superphosphate is made as follows: the ground bone is put into a wooden or leaden vat and is thoroughly wetted. Sulphuric acid (oil of vitriol) is then poured on at the rate of 120 pounds to 480 pounds of bone. The mixture foams up and the bone is changed in character: the phosphoric acid is released and the lime of the bones unites with the sulphuric acid and makes sulphate of lime or plaster. The bone is then in a pasty condition and is dried by mixing dry wood ashes or plaster with it. It is then what is called dissolved bone. A ton of dry bone will make about 2,500 pounds of superphosphate; 300 or 400 pounds of this are generally used per acre in seeding down. Clear bone dust is an excellent manure and nothing is needed with it to make a perfect fertilizer but some potash; either wood ashes or the German potash salts. Oyster shells when burned make the best of lime; they do not need grinding.

DRAINAGE FURROWS, ETC.

Apprentice (no address).—In getting rid of surface water on our winter wheat, our land being stiff clay, the practice here is to plow into narrow beds, leaving the "dead-furrows" very deep, and then to cross-furrow every two rods, at right angles, to go as deep as the dead furrows. This is ruination to self-binders. Is there a better way, and, if so, what is it? 2. Is there a winter wheat as hardy as Lancaster, and with a stiffer straw so as not to be so liable to lodge and, withal, as good to yield?

ANS.—1. This class of land must be bedded up; but it need not have the dead furrows opened so very deep. We open out with a furrow cleaver so made as to carry the dirt well back. This leaves a clean, shallow furrow which carries the water nicely; but still is only two inches or so below the surface on each side. This carries off the water just as well as though a foot deep. Make no cross-furrows except in the bottom of the natural depressions where the water must necessarily go, and make these by plowing, so as to have the furrows like a dead-furrow, and clean out so as to be more of a valley than a deep furrow. These cross, or rather drainage, furrows need be only few in number and then, by cutting the wheat lengthwise of the land, the shaking and injury to the machinery will be reduced to the minimum. 2. Yes; the Diehl-Mediterranean. It yields better than the Lancaster, and you can hardly make the lands so rich as to cause it to lodge.

SMALL FRUIT QUERIES.

H. T. Dorr, Dansville, N. Y.—What kinds of blackberries and black and red raspberries would be best for market here? What would be the best time to plant them? How should protection be given to those needing winter protection? Would sod-ground plowed now be suitable for planting blackberries and raspberries this Fall?

ANS.—We think that every farmer should try a number of kinds of berries in order to find out which are best suited in his soil and location. Something may be learned by going among the small-fruit culturists near. For black raspberries try Nemaha, Souhegan, Mammoth Cluster, Hilborn. For reds, try Turner (home use), Cuthbert, Shaffer's Colossal. For yellow, try Caroline and Golden Queen. Blackberries: try Snyder, Taylor, Kittatinny and Early Harvest; Kittatinny and Early Harvest need protection. Strawberries: Jewell, Sharpless, Parry, Crescent, Downing. You may plant the strawberries now: the blackberries and raspberries in October or next Spring. To protect blackberries, bend over the canes and cover lightly with evergreens, straw or litter. Bending them over will often prove a sufficient protection. If the canes are too strong to bend, it will be necessary to dig away the soil on one side. We know of no objection to sod-ground for blackberries or raspberries, except it will be needful to compact the soil about the roots.

PROPAGATING THE JAPAN CHESTNUT.

M. J. Barrie, Ontario, Canada.—Which is the better way of raising the Japan Chestnut—from the nut, or by getting young trees? Where can either be obtained? 2. Can the black walnut be grafted on the butternut?

ANS.—1. It is very easy to raise the Japan Chestnut from nuts. We have little trees, a foot or more high, from nuts planted late in the Spring. But these seedlings will vary the same as American chestnut seedlings vary—in the size and quality of their nuts. There are several nurserymen who have raised many seedlings, and are now propagating the best of them. These will be offered for sale in due time. We are not positive that the nuts are at present offered for sale. Ellwanger & Barry, Rochester, N. Y.; Storrs, Harrison & Co., Painesville, Ohio, and doubtless others have the trees for sale. 2. Yes.

BITTER ROT IN APPLES.

G. E. C., Lovely Mount, Va.—On many of my summer and fall apples are small rotten spots which gradually spread over the whole of the apples. Here the disease is called bitter rot; what can be done to prevent it?

ANS.—This is a common disease, wherever apples are grown; and the name "bitter rot" is the only one we have heard applied to it. It attacks the apple only at maturity; although certain varieties are especially subject to it, while others are nearly or quite exempt. It is also true that large or overgrown specimens of the same variety are more liable to be affected than those of medium or small size. The disease attacks equally summer, fall, and winter varieties. So far as we know, this disease has never been subjected to a scientific examination, and the cause is not known; although there are reasons for the suspicion that it may be attributed to some of the very minute forms of fungus or bacteria. We know of no remedy, or preventive, save the avoidance of excessively stimulated growth; or the rejection of such varieties as are especially subject to the disease.

Miscellaneous.

S. E. S., Medina, N. Y.—How can I clean cockle out of Fultz Wheat? The kernels are so nearly alike in size that it is impossible to screen it out. This is the worst fault I have to find with Fultz Wheat.

ANS.—We hook the "shake" to the mill so that the "shoe" will lie still; fit a board of the right length, so that it will go into the "shoe," its lower edge resting on the screen; take out all the sieves, and put in the board in such a place, moving its top edge back or forth, so that when the mixture of wheat and cockle is allowed to run through slowly, while the mill is turned steadily and quite fast, all the cockle and much of the lighter wheat will be driven back of the board, and run out at the back end of the mill. Nothing but clean wheat will then fall in front of the board, and run out at the front of the mill. This cleans wholly by the blast, and is a sure way to separate all foul stuff.

E. R. M., Lincoln, Ind.—1. What are the four best plums likely to prove hardy in Northern Indiana? 2. Where can I get seed of the Japan chestnut? 3. How can I propagate the Golden Retinispora? 4. In what is the Thousand-fold Rye superior to the common kind? 5. Is the Shumaker a red or white wheat?

ANS.—1. Green Gage, Imperial Gage, Jefferson, Lawrence's Favorite. 2. Try Storrs, Harrison & Co., Painesville, O. 3. By grafting and layering. 4. It is superior at the Rural Farm in having a larger kernel and longer heads. It ripens later than common rye. 5. It is an early, dark-chaff, red-kerneled wheat.

DISCUSSION.

LIGHTNING RODS.

I. P. R., CORNELL UNIVERSITY, ITHACA, N. Y.—On page 545 I notice a short clipping on lightning rods from the Vermont Watchman, which, it appears to me, is likely to lead people astray. Galvanized iron is a very good conductor of electricity, but four-ply of it will not furnish enough metal to conduct even a small charge, much less a large one. Where only a small amount of iron is used, the resistance is so great that the rod becomes either intensely hot or entirely melts, which often endangers the building more than if no rod had been upon it. A wire cable of not less than ⅝ of an inch in diameter is as small as can be used with safety. If copper is used instead of iron, the cost will be somewhat increased, though the cable need not be over half the size of an iron one. Our lightning rod runs directly through the hay mow and we consider it safe because the rod is large enough to carry off the electricity without even warming the rod. It is stapled to the roof and has a ground connection of old copper boilers deeply buried in the earth.

D. E. P., OTOE CO., NEB.—In a late RURAL some one tells about hoeing sweet potatoes. I have raised them for 60 years and never heard of such a thing before. I always make ridges for sweet potatoes and hoe between the ridges, and pull the weeds out of the ridges. That writer wants us to hold the vines with one hand, and hoe with the other. That looks to me about the greatest nonsense I have read lately.

Miscellaneous Advertising.

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

THE "COMMON SENSE" MILK PAIL.

PATENTED.

This is the only *perfect* Pail made.—There are no seams in the front to catch the dirt. It has a perfectly fitting strainer, which can be instantly removed, so that every part of the pail may be *quickly* and *thoroughly* cleaned. Extra strainers can be obtained at any time.

The Pail is made from heavy XX tin, and is in all respects the **best in the world.**

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, SEPTEMBER 11, 1886.

We hope to retain for years to come as in years past, the bulk of our old subscribers without any further inducement than that which the RURAL NEW-YORKER *itself offers. If they continue to need and to prize it, they will continue to subscribe for it. In order to induce those who would gladly see its circulation largely increased to aid us in this work, we have placed before them two propositions. The first is that in clubs of five or over, the price will be (until further notice)* $1.50 *per year. The second is embodied in the premium-list, a careful examination of which will certainly show that adequate compensation is offered for any effort our friends may kindly make in the* RURAL'S *behalf.*

WE would call attention to the zinc label, and the way of attaching it to stakes as well as to the branches of shrubs and trees, which we have finally adopted at the Rural Grounds, as at once the simplest, cheapest and most durable of all labels and attachments known to us.

PARTICULAR attention is called to our clubbing combination list on pages 610 and 614. Any of our readers desiring to subscribe for any of those papers in connection withthe R. N. Y., may subscribe through us, with the assurance that the *promptest attention will be given their favors.*

AMONG the newer kinds of grapes, we think it may be said that Moore's Early is among early grapes what its parent, the Concord, is among later. We know of no other grape of its season about which so much good can be said, while nothing can be said against it except that it is no better in quality than the Concord.

IT is desirable that the RURAL NEW-YORKER should be represented at all the agricultural fairs of the country. Those who are willing to act as agents will be furnished upon application with posters and all the specimen copies they may need.

THE difficulty of forecasting prices of agricultural products is well exemplified by the contradiction now noticeable in the cotton market. The price of the staple is more than a cent a pound less than a year ago; yet the visible supply is 25,000 bales less, and the current estimates of the new crop are half a million bales less than the current estimates a year ago. True, the stocks of raw material in the hands of manufacturers are thought to be heavier now than then; but it is known that the stocks of manufactured goods are lighter.

A UNITED STATES cutter has seized three vessels belonging to the Canadian province of British Columbia, for fishing for seals in Behring Sea within the marine jurisdiction expressly ceded by Russia to the United States on the purchase of Alaska. It seems, therefore, that there are two sides to the fishery question, and that Americans can retaliate for Canadian seizures of offending fishermen. Apart from this, there is considerable complaint regarding increased stringency in the enforcement of customs regulations on both sides of the line. It seems to us that the present trouble is somewhat of a childish nature, and that an amicable adjustment of the existing difficulties would be hailed with satisfaction by all sensible men in the Dominion and the Union.

THE offense must not be repeated. The reputation of American young men; the delicacy of English young women, and dread for our foreign commerce forbid it. An English shopkeeper writes to the London Daily News that lately one of his assistants, on cutting open an American cheese, discovered a tin box in the center of it. Inclosed in it was—not dynamite, but something more dangerous to the well-being of English households—a letter which said that the writers, two young men, would be pleased to receive correspondence from two young ladies, the names and addresses of the writers being given. If nice, modest English young girls are to be exposed to the temptation of clandestine correspondence in this way, how long will it be before careful English matrons will forbid the entry of American cheese into their houses? Again we say, therefore, that this offense, fraught with such dire consequences to one of our most important dairy interests, must not be repeated, and we very earnestly entreat all cheesemakers to keep a watchful eye on their young men.

THE SAME OATS UNDER DIFFERENT NAMES.

DURING the past season we raised side by side 19 varieties of oats; that is, oats with different names. A report of all will be made later. It may be well that we should hasten to state that the seven kinds sold respectively as White Australian, Welcome, Badger Queen, Clydesdale, Racehorse, White Belgian and Dakota Chieftain are, so far as the writer could judge, *all the same.* We further find that the Yankee Prolific is the Russian White or White Russian. Now, the Welcome was sold several years ago at a very high price as a novelty. The first season they were offered, we found them to be the Australian, and so stated in these columns. They are now offered at $1.25 a bushel. The Racehorse are now offered at $1.25; the Clydesdale at $3.50; the White Australian at $1; the White Russian at $1; the Yankee Prolific were offered last year at $10 (!) per bushel. We have no catalogue of this year to refer to. This is bad business. We do not suppose that reputable seedsmen will wittingly buy old varieties and sell them as new; neither is it reasonable to assume that seedsmen can give that careful study to flowers, vegetables and grains, which would enable them to recognize old varieties, grown perhaps under the most favorable conditions, and offered to them under new names. But when, by careful tests, they are found to be the same, the new name should be discarded—abhorred! Can any conscientious seeds firm sell "Yankee Prolific" Oats at $10 a bushel, knowing they are White Russian, which are worth but $1?

THE RURAL NEW-YORKER NO. 2.

THIRTY-THREE hills of this R. N.-Y. seedling potato were dug Aug. 31. We may be pardoned for thinking that it is of its class the nearest to a perfect potato which the writer has ever seen, since in the plot where it was grown probably over 600 varieties have been tried during the past ten years. The yield of the 33 hills was 120.25 pounds, which as the hills were one foot apart and the trenches three feet apart, would be at the rate of 881.83 bushels (60 pounds) to the acre. There were but 187 potatoes, and of these all were of marketable size but 22. Even the largest (five of which weighed 4¾ pounds) were smooth and shapely. Its form is oblong, inclining to round, and much flattened, while, except at the "seed end," there are but three or four eyes, and those are nearly level with the surface. The skin is white; the quality is the best as far as can be judged at present.

This potato has been placed in the hands of one of our first seedsmen for propagation, and it will be sent to our subscribers as soon as the supply will admit. We had intended to place the R. N.-Y. No. 1 (Rural Calico) in our next seed distribution, but it has this season developed failings, and we shall try it yet another year. We do not care to introduce any of the Rural seedlings until we are satisfied that they are better than any of the kinds already in the market.

ONE TEACHER OR THREE.

IN many country school districts there is a new teacher for every term in the year. It will pay to appropriate a little more money and secure one good teacher for all three terms. As a rule, young women who will teach for low wages are placed in charge of the school during the Summer. In the Winter, when the larger boys and girls go to school, and when it is considered that the best teaching is required, a man is engaged. By adding $50 to the amount now paid to all three teachers, one good one could be secured who would teach for the same length of time and do far better work. Our experience with district schools shows us that it takes at least three weeks to find out what the previous teacher had taught the scholars, and then the methods employed by one teacher are so different from those of another that often the best half of the term is wasted in getting ready to begin. Where the teacher is selected for the whole year and the whole school money is to be contracted for at once, far more care will be exercised in securing a suitable person. Where the teacher is engaged for only three months there is always a feeling that it is a small matter; if he does not suit he can go at the end of the term anyway. Those who think the older boys and girls need all the careful instruction, and that anybody who can "hold down a chair" will do to teach the little people, are sadly mistaken. These points should be considered this Fall. Get one good teacher and pay him well.

FIX THE ROADS.

WHAT is to be done about the roads in your township this year? Are they good or bad, and what do the people propose to do about them? Too many of our country roads are in a very bad condition. Most of the work on them is done in the Fall, and in a very half-hearted manner. "Working on the road" is generally a disagreeable task, and the workers are ever ready to "kill time." The usual system of road-mending is to scrape the earth at the side on to the crown of the road, or to dump a great mass of gravel into every bad place. The work is all done at one season, and for a few weeks the roads are about impassable; until they can be "worn down" there is little comfort for man or beast. Then the work is dropped for the year, the same practice to be gone through with the following Fall. If each little leak or washout could be taken in time, the roads could be kept in fair condition all through the year at a moderate expense, but the money gives out after the fall work, and there is nothing left for repairs. Many townspeople spend too little money upon their roads, and what they do spend is poorly applied. In some localities the system of hiring a man to make a business of keeping the roads in order has been very successful. If a man takes a contract to keep the roads of a township in order, he is bound to do it, and he will have to watch them carefully. In the cities and larger towns repairing is constantly going on. Every little defect and failure in the road is corrected at once. The streets never become impassable, because bad places are not allowed to grow. Something of this system should be employed in the country. Farmers are busy men, and cannot always leave their work to give half a day to road-making. If some man could be made responsible for the performance of the work, and paid for doing it, there would be a difference. No arguments are needed to prove that good roads are a blessing. They add to the value of property, increase the social features of any neighborhood, and promote the welfare of the people in every way.

THE FARMERS' CONGRESS OF THE UNITED STATES.

THE Farmers' Congress which met last week at St. Paul decided to make the institution permanent, and measures were taken to incorporate it under the laws of the United States as "The Farmers' Congress of the United States." Every year delegates are to be sent to it by assemblies of farmers in the various States in the proportion of one for each Senator and Representative in Congress. It is proposed to hold regular sessions each year, and in this way to give expression to the opinions and wishes of the farmers of the nation, who, with their sons and helpers, form more than half the voters of the country.

In addition to the resolutions mentioned last week, the assembled farmers also passed others favoring the development of the system of water transportation as a check to railroad extortion, and asking the intervention of the Government to prevent unjust restrictions by foreign powers against the importation of American farm products. This was especially directed against the action of France, Germany and other Continental countries in excluding American hog products on false pretences. It was also resolved that the tariff of 1867 on wool should be restored, and that protection should be given to home-grown rice and sugar by the imposition of heavier duties on importations of their foreign rivals. A resolution also favored the extension of the Signal Service so as to give timely warning of approaching changes in the weather to the farmers of all parts of the country; while another urged the general Government to regulate inter-state commerce. This resolution was one of the most important of the series, as a change in freight rates is virtually a change in the value not only of the marketable products of the farms, but even of the farms themselves, and it is intolerable that frequent changes in matters of such great importance should depend on the selfish decision of a handful of unscrupulous railroad speculators and monopolists. It is very easy to point out evils of this kind, however, but very difficult to devise a remedy, and hence the convention could not agree upon indorsing either of the bills on the subject pending before Congress. Some supported the Cullom bill passed by the Senate; others the Reagan bill, passed by the House. The meeting throughout was orderly; its deliberations were calm and dispassionate, and its recommendations are worthy of attion by the people at large and their Representatives in the National and State Legislatures.

32 PAGES.

BREVITIES.

POTATOES at the Rural Grounds are rotthig more than ever at this season of the year.

Farmers pass excellent resolutions at their conventions; why don't they vote in accordance with them at the elections?

THE new white Jessica grape was fully ripe at the Rural Grounds Aug. 20; Moore's Early Sept 1; Florence (black) was ripe Aug: 20, but the quality is very poor.

MANY farmers do not care to sow nitrate of soda or sulphate of ammonia upon the soil and leave it exposed to the action of the air lest the ammonia may be lost. Though soluble in water, and very readily so, not a particle is lost by exposure to the atmosphere.

WE have some proof that tubers from young seedling potatoes may be improved in shape and productiveness by selecting the best tubers from the best hills for seed, and we are impressed that it pays to select all our potato seed, whether from old or new kinds, in the same way, with the same object in view.

WE say mulch heavily between the rows of strawberries as soon as the ground freezes, and cover the plants lightly. In the Spring the plants will easily grow through the mulch and the berries will rest upon it. Leave the mulch *between* the rows until *after* fruitage—*then* cultivate.

WE are told that Ayrshire cattle are attracting increased attention in England, both at the shows and in the dairies. In our own country the Ayrshires have gained many friends of late. Can it be that we are to have a "boom" for the Ayrshires? There are many worse things that might happen to the dairymen of the country than this same "boom."

MR. H. H. HAAFF, of Atkinson, Ills., whose excellent book on "Dehorning Cattle" was reviewed in a late RURAL, writes us that in one hour, in the barnyard among cattle, he could convince us that dehorning, as he performs it, is not necessarily painful. He is positive that his system of dehorning has never been practiced before, and that it is bound to come into general practice. Mr. Haaff has the good of stockmen at heart. He is working earnestly to increase the usefulness of his discovery.

YOU can hardly do better than to sow the Armstrong (sold as Landreth) Wheat. It is as hardy as any of the hundred varieties tested at the Rural Grounds, very productive, and makes a good flour. Some day we hope that one or the other of the Rural crossbreeds may supersede it. Martin's Amber is also a first-rate wheat in every way, though it is so like the Landreth that the one answers for the other, except it may be in milling qualities, which we don't happen to know any thing about.

TEN dead calves and twenty-two dead sheep were taken out of two "double-deck" cattle cars that arrived at Newark, N. J., from Owego, N. Y., Thursday morning. The wretched animals on the cars were wedged closely together, and the odor was sickening. They had been on the road 36 hours, and no attention whatever had been paid to them on the journey. The Society for the Prevention of Cruelty to Animals is to bring suit against the railroad company; but are the brutes who shipped them, and the other brutes who were supposed to have charge of them to go scot-free?

A LITTLE band of agitators claiming to represent the Knights of Labor, a number of agricultural associations, anti-monopolists, trades unions, the Peoples' Party, and temperance reformers, met at Indianapolis a week ago and resolved to form a new party; but they exhibited a wide and apparently irreconcilable difference of opinion as to the basis on which it should rest. A great deal of long-winded resolutions and fine-spun theories occupied much of the time. Although a majority of those present belonged to the Grange, Wheel, or Farmers' Alliance, the Knights of Labor and Greenbackers had things all their own way. A committee of eight was appointed to arrange for a national convention at Cincinnati next February; but no place on the committee was given to any representative of the agricultural interests. The whole thing, though loudly puffed in advance, was a sheer fiasco. It indicated, however, a certain amount of discontent with existing parties, but wide as this may be, they certainly will not be superseded by this "party of the future."

THE FOREST AND STREAM.

is a bright weekly paper devoted to Fishing, Shooting, Natural History, the Dog, Yachting and Canoeing. It tells of camps and tramps in the woods and on the prairie, contains interesting accounts of travel and adventure in many lands, fresh and interesting information about habits of our wild birds and animals, and gives news about all wholesome out door sports. There is no paper in the world Just like the *Forest and Stream*. It will pay you to look at a copy or two. Special trial trip to the readers of the RURAL NEW-YORKER; three copies of different dates sent at one time, 25 cents. Single copy, 10 cents; $4 per year. Send for free catalogue of our works on out-door sports. Mention this paper. Address FOREST AND STREAM Publishing Co., New York.

IMPORTANT

TO ALL READERS AND AGENTS.

It has been decided that in Clubs of FIVE or OVER we will mail The Rural New-Yorker from now until January 1st, 1888, for

$1.50.

That is, Fifty Cents Commission will be allowed for every yearly subscriber. After January 1st, 1887, the Rural New-Yorker will be mailed One Year in Clubs of five or over for $1.50 until further notice. For single subscriptions the price will be as hitherto, invariably $2.00 per year. In Clubs of less than five, as well as for larger Clubs, the Premium List should be consulted.

We beg to say that the following Premium List has been made up, with the kindly aid of our advertising patrons, so as to allow, in the articles offered from ONE TO TWO DOLLARS FOR EACH SUBSCRIPTION SENT. We have spared neither pains nor expense to induce our friends to work for the Rural New-Yorker during the present subscription season.

BEGIN NOW!

We will send Specimen Copies to any names or list of names forwarded to this office as often as desired, in order to aid our friends in obtaining subscribers.

Meanwhile we shall exert our best endeavors to make the Rural better than ever.

RURAL NEW-YORKER, 34 PARK ROW NEW YORK.

TO OUR SUBSCRIBERS
AND AGENTS.

The attention of all our readers and agents is called to the above announcement. With the view of inducing our friends to exert themselves in the "RURAL'S" behalf, we have done all in our power (limited only by prudence) to present a list of articles which will pay them *adequately* for their work. In so far as we may judge, a more liberally scaled premium list has never been presented by any trustworthy journal.

To those who prefer a cash compensation, we have to announce that, as above stated, in clubs of five, or over, the price of the "RURAL NEW-YORKER" will be, until further notice, $1.50.

Respectfully and earnestly soliciting the support which our friends may deem the "RURAL" worthy of, they may rest assured that nothing can moderate our desire to increase its influence, and to make it in every way more worthy of their confidence and regard.

INSTRUCTIONS.

Send for all the specimen copies and posters desired. A good way is to hand several specimens to those who may wish to subscribe (or have us, at our expense, mail them) and then, allowing a few days for examination, call upon them and solicit their subscriptions. Commence the work at once. Commencing early insures success.

The RURAL values the entire confidence of its readers, and therefore has no interest whatever in the sale of anything except the R. N.-Y. If you wish to PURCHASE any premium found in the List, apply to the manufacturers, kindly mentioning the RURAL.

The smaller premiums are given for PROCURING new subscribers—in other words for increasing our circulation. It will be apparent to all fair-minded readers that we can not afford to pay for individual renewals of subscriptions. We assume that, knowing the paper, no such inducement should be required. When, however, they are willing to exert themselves in our behalf by sending us new subscribers, or by making up clubs, whether new or old, THEN OUR CLUB-RATES OR PREMIUM LIST IS AVAILABLE.

You can send for a Premium for each subscriber as the names are sent to this office, or complete the list and then select as may be preferred.

Old and new subscribers, we repeat, count in clubs of five or over, and they may be sent from different post-offices.

Money, sent by letter, almost always reaches us safely. Still unless registered, we can not assume any risk.

Premiums are sent at the expense of the agent, unless otherwise noted, either by mail or express as desired. This Premium List will be operative until June 1st, 1887.

THE following premium list is the most liberal we have ever offered, in fact, we consider it the most liberal list ever offered by any paper in this country. We do not like to ask our friends to work for us for less money than they could make working for themselves. We are a little proud of the fact that every one of our subscribers is like a personal friend, and we know that the majority of them will gladly say a "good word" in the "RURAL'S" behalf. We do not like to see people work for nothing; we object to doing it ourselves, and we will not ask others to do it. We wish to make a business arrangement with every one of our friends. We want to extend our circulation, and we want the help of every person who sees the *Rural New-Yorker*. We propose to pay for this help, and a study of this List will show the amount of pay we offer. If any person can obtain surer returns by canvassing for any other paper, we desire to be told of it. Start now, and you can offer the paper for the rest of this year, and the whole of next, for one price. We will gladly answer all questions, and keep all supplied with posters and specimens.

OUR readers should understand that these premiums are given **for** new subscriptions, and not **to** new subscribers. The "RURAL" is well worth the subscription price. In times past new subscribers have demanded premiums for their own single subscriptions. That there may be no misunderstanding during this campaign, we will state that the premiums will be given only to those who are already subscribers, or to regular agents. Any **new** subscriber will be entitled to commissions for any subscriptions he may send after his subscription has been received. The premiums are not given because we think something additional is needed to make the "RURAL" worth its price. We give the various articles named in our list, simply as payment **for services rendered.** Those who work for us, and spend their time and energies in helping to extend the circulation of the "RURAL," deserve to be rewarded, the same as if they engaged in any other work.

We have just had printed a new and beautiful poster. It is handsome enough to hang anywhere. We want to have one hanging in every house, every store, every post-office, every grange every shop, every stable, and every barn. You cannot possibly put up too many of them. Place them in every spot where farmers congregate. Keep them before the public. We will gladly ***send copies to all*** who apply. Send for the full account of our Free Seed Distribution. Join in the RURAL campaign for 1886-7. Begin now!

PREMIUMS.

AGRICULTURAL IMPLEMENTS.

No. 1. Dutton Mower Knife Grinder. Given for Six Subscribers.

THIS little machine weighing only 20 pounds will sharpen the knives of a mowing machine quicker and better than the largest grindstone. It will save its cost in one day. It can be attached to the wheel of the mower and the

mower knife quickly and easily ground by one person. Sharp knives save grass and wear and tear of the machine and of horse flesh. It is made by the R. H. Allen Co., 189-191 Water St, N. Y. City. Although it sells for $7.50, and is worth it, yet we will send it to any person sending us six subscribers.

No. 2. The Hitchcock Potato Digger and Shovel Plow combined. Given for Ten Subscribers.

THIS is a simple, but valuable implement. Although it does its work perfectly, yet it is of remarkably light draught and can be used with one horse. A cheap and good potato digger is a much desired implement. Potato digging ranks with manure spreading as hard and uncomfortable work. The common plow does fair work but too much hand digging is required in combination with it to secure all the tubers. We believe the Hitchcock Digger will give good satisfaction. Most diggers are high-priced, and beyond the reach of the smaller farmer. They can be used only through the short digging season and are

practically worthless for the rest of the year. We should advise the purchase of the combined implement which by the changing of one bolt can be converted either into a shovel plow or a potato digger. The price of the Combined Tool is $10.50 and we will send it for 10 subscribers. The Potato Digger alone, price $8.00, for eight subscribers; or the Shovel Plow, price $7.00, for seven subscribers. Manufactured by the Belcher and Taylor Agricultural Tool Company, Chicopee Falls, Mass.

No. 3. Cole's Improved Garden Plow. Given for Three Subscribers.

THIS handy little implement materially lessens the labor of cultivating the garden. We have it in use and would not be without it for many times its cost. Its excellence is largely due to the size of the wheel and adjustments so that the force applied to the handles acts parallel to the resistance of the plow

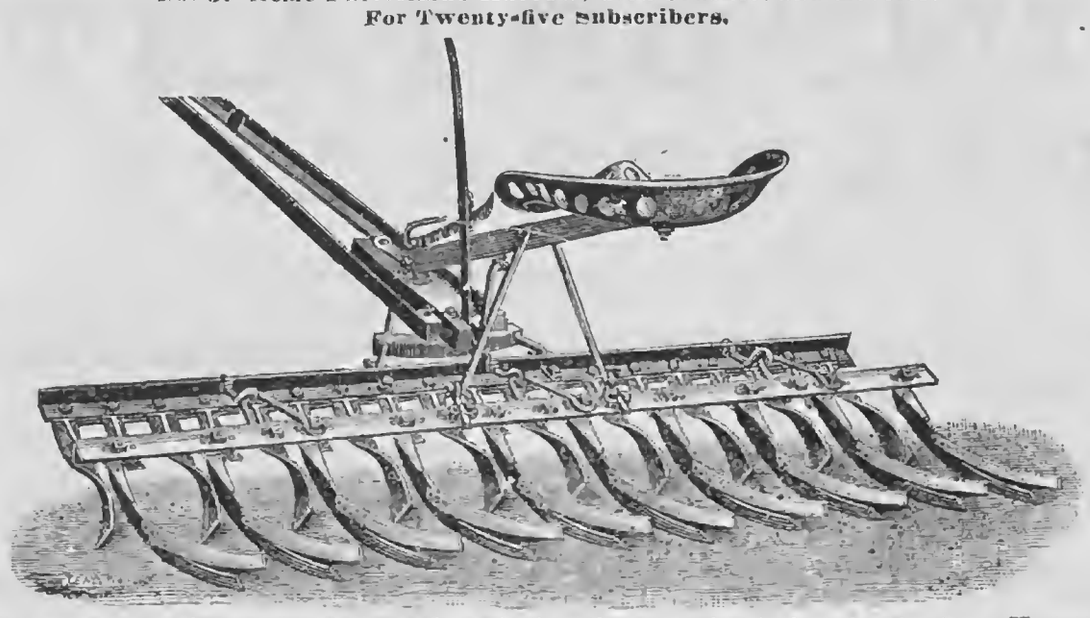
or scuffles instead of wasting the force by pushing directly into the ground as is done in the straight handled small wheeled hand implements. The plows, large and small, and the scuffles are of steel. It is made by G. W. Cole, Canton, Ills. Price complete with attachments $5.80.

No. 4. Lewis's Combination Force Pump. Given for Five Subscribers.

The cut shows the pump in the three forms into which it can be readily changed. It is made of drawn brass tubing, is 1⅞ inch in diameter, and weighs 4½ pounds. It is an excellent fire extinguisher, throwing a stream of water 50 to 60 feet. It can be changed from a

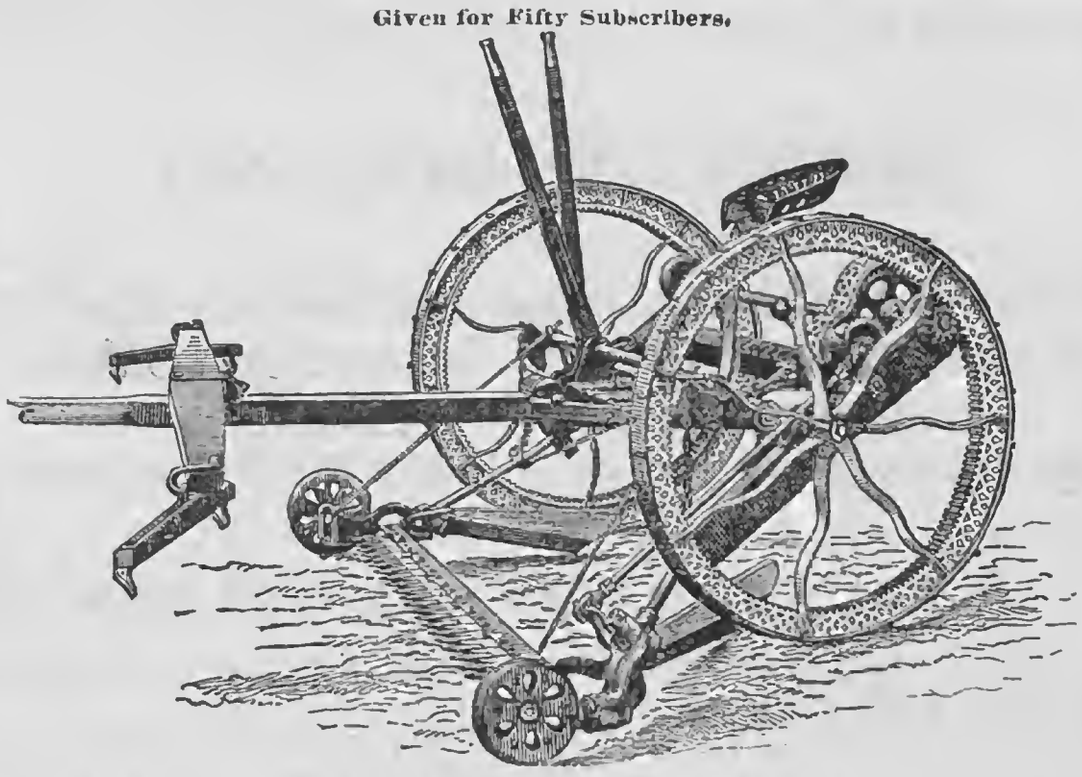
force pump into an insect sprayer, having a nozzle for this purpose, which gives a fine spray, and proves very satisfactory. It can also be changed into a veterinary syringe, and as such is a very useful instrument. Agents are meeting with fine success in selling these pumps, and they are a very desirable premium. Price $6. Made by P. C. Lewis, Catskill, N. Y.

No. 5. Acme Pulverizing Harrow, Clod Crusher, and Leveler. For Twenty-five Subscribers.



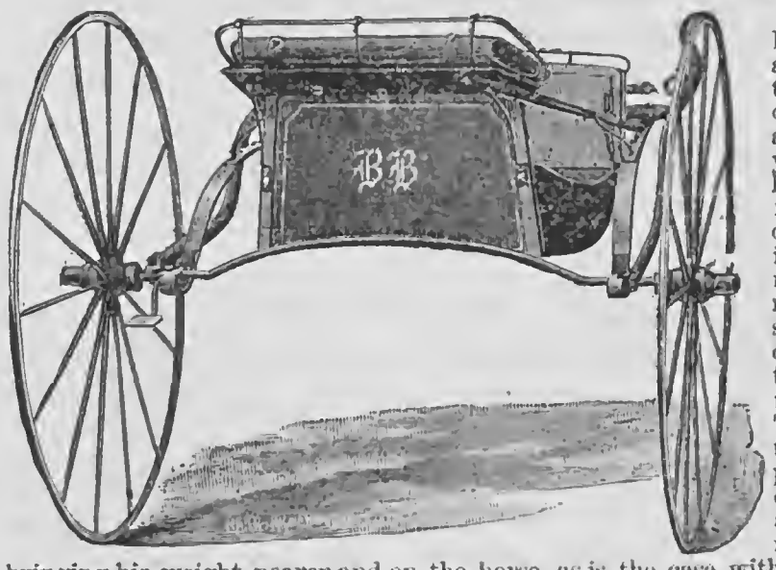
There is no tool that could be made to do just the work that is done by the Acme Harrow We have never used any other implement that has given us such complete satisfaction. Its work is unique. Its peculiar combination of cast steel coulters or slicers, by their continual cutting, lifting and turning, seems to completely pulverize and mellow the top two or three inches of soil and put it into the best possible condition to receive the seed. In hard clay lumps, on inverted sod and on the lightest land, it seems equally at home, and it cuts and slices until the surface is all gone and any ordinary growth of weeds annihilated. The implement is so well known that words spoken in its praise seem almost useless. We could not farm without one, and we believe those who once use one will say the same thing. Made by Nash & Brother, Millington, N. J.

No. 6. The Eureka Mower. Given for Fifty Subscribers.



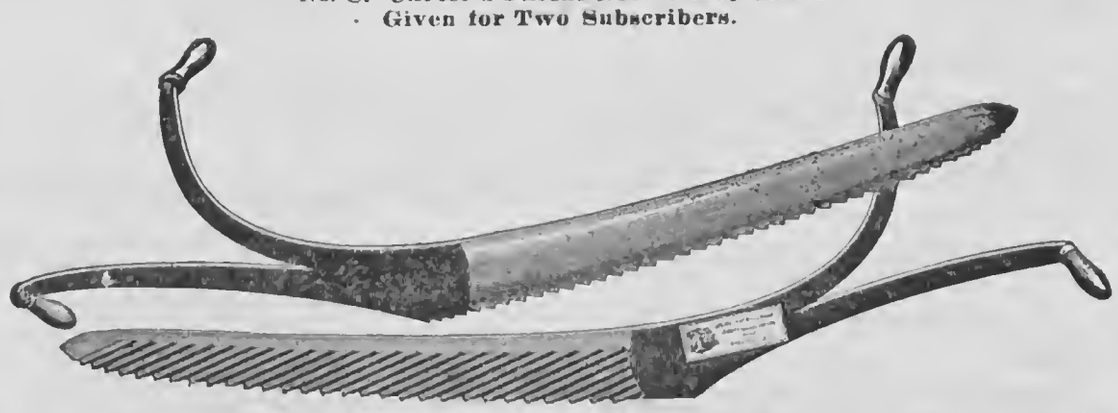
Last year we said, in speaking of the Eureka, that having used it for five years in all kinds of grass, we would no sooner think of going back to a narrow, side-cutting mower than we would to the old hand-rake reaper. We can only reaffirm this opinion. In this machine the cutter bar is directly behind the horses and in front of the driver. Every part is made of the strongest material, and the whole machine is put together to stay. The size we offer cuts six feet wide, and a pair of ordinary farm horses will handle it with ease. The idea that this machine runs so heavily that extra horseflesh is required to move it is absurd. We can highly recommend the Eureka. It will make friends wherever it goes. The machine is made by the Eureka Mower Company, Utica, N. Y. Price, $90; and the man who secures it will be sure to say that it is worth the money.

No. 7. The Beebe Cart. Given for Thirty-five Subscribers.



In offering the celebrated Beebe Cart as a premium we are giving our readers a chance to obtain something more than ordinarily useful, ornamental and durable. In educating young horses, in riding over hilly country, or rough or muddy roads, this cart is without a superior. It's a cart that is easy to mount and is pronounced perfection by horsemen. It is wide between the shafts. The cross bar is circular, allowing ample room for the horse and lending elasticity to the girting of the shafts. The seat is just right, low, and the position of the feet for pullers, is such that the driver cannot be brought off the seat, and be made to stand or nearly so on his feet, thus bringing his weight nearer and on the horse, as is the case with other carts of this class with high seats and with less room to brace the feet. The springs are back and rest on the axle, making little weight on the thill straps. This cart is light and graceful, is nicely balanced and an easy rider. The seat is of perforated veneer, and handsome. The foot rest is made with slats. The fact is that every horse owner ought to have something of this kind, and he cannot do better than to write to the Beebe Cart Co., Racine, Wis., for a circular and prices. The price of the one we offer is $46, delivered on board the cars at Racine.

No. 8. Carter's Patent Needle Hay Knife. Given for Two Subscribers.



This knife has been tested fully by the side of the best knives made, and will cut more hay and do it easier than any of them. Its velocity and special excellence consist in the chisel edge teeth, as shown by the lower knife in the above cut. It cuts rapidly and easily, hay or straw, in stack, mow or bale, and can also be used for cutting moss or peat, or for cutting muck in ditching, or wherever a hay knife is to be used. As the grinding is done only on the smooth side, any novice can grind it and do it well; if a tooth breaks out, a slight grinding replaces it as good as new. It is made by the North Wayne Tool Co., Hallowell, Me. Price $1.75 each.

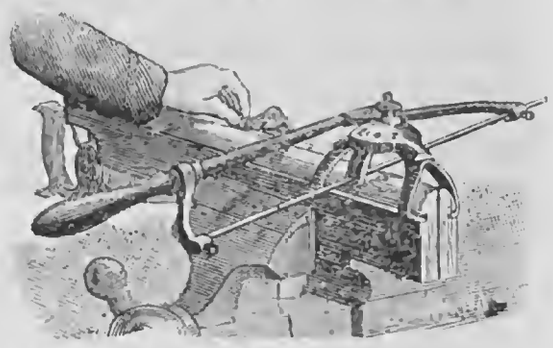
No. 9. Londerback's Combination Tool. A No. 2. Given for One Subscriber.

This combination tool was found last year to be one of our most popular premiums. When

one considers the *multum in parvo* represented in this combination it is not surprising that every household wants one. There are 10 different but useful tools in one, as will be seen by reference to the cut: A, adjustable screwdriver; B, hand vise; C, wrench; D, nail puller; E, large gas pliers; F, hammer; G, leather punch; H, wire cutter; I, small gas pliers; J, pincers. These are made by Edwin Londerback & Co., 413 South Fifth street, Philadelphia, Pa. Prices, No. 2—9 inches—$1.25; No. 3—12 inches—$1.50.

No. 10. Roth's Saw File Guide. Given for Two Subscribers.

We will venture to say that not one-half of our readers keep their saws in a condition to work properly, and we are glad to offer on liberal terms, a tool which will enable anyone to put a saw in the best possible condition. It is a pleasure to do work with a saw when in good order; but it is hard work and kill-time to do work with a saw in bad order, and

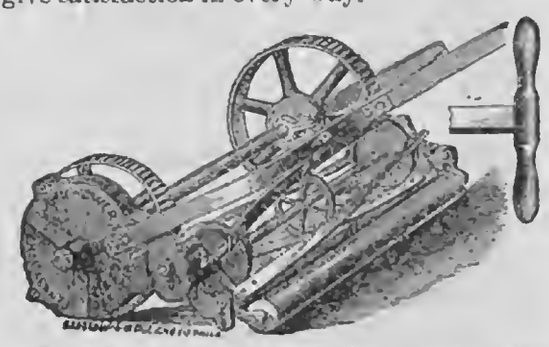


always taxes patience and body to an alarming degree, besides a loss of much time. A saw in good and proper order will do more and better work in one hour than a bad one will in three hours.

Very few carpenters even know how to file and set a saw properly. This instrument will enable any person to do it with greatest accuracy. No person who uses a saw should be without one. The hand saw guide will be delivered anywhere on receipt of price $2,50. E. Roth & Bro., New Oxford, Pa.

No. 11. Pennsylvania Lawn Mower. Given for Twelve Subscribers.

A good lawn mower is a necessity to one who desires to have a good lawn. A poor mower is a most unprofitable investment. We have used the Pennsylvania Mower for a number of years, and can assure our friends that it is one of the best made. The size we offer has a 14-inch cutter and an 8-inch wheel. It can be operated by a lady, as the weight is only 36 pounds. It will cut long grass, and give satisfaction in every way.



It is durable and simple in its work. We can assure our friends that, if they secure one of these implements, they will be well satisfied with the result of their labors in our behalf. The price of the mower is $12.50. For 12 subscribers it is one of the best of premiums. Made by the Lloyd & Supplee Hardware Co. of Philadelphia, Pa.

No. 12. The "C. C. Brooks" Swivel Plow. Given for Fifteen Subscribers.

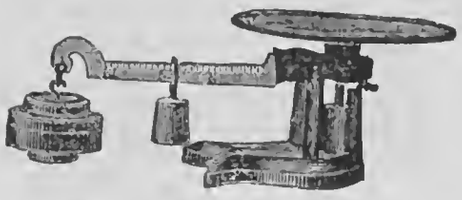
This plow has given excellent satisfaction wherever used. It works well on level ground and on side hills. It is equally good on low land or turf. It is guaranteed to turn a hand

some furrow 16 inches wide and 8 inches deep. A good tool; one that will give satisfaction every time. Price of No. 1, $15; Steel Mould Board, $1 extra. Manufactured by B. & J. W. Belcher, Chicopee Falls, Mass.

No. 13. The Aquapult. Given for Five Subscribers.

A more useful machine than this it would be difficult to find. It can be used as a fire engine, portable force pump, sprinkler, window washer, bug destroyer, etc. The method of using it is shown by the illustration. It will throw water forcibly against a 2nd-story window. It will pay for itself in one season. Price $9. Made by W. & B. Douglas, Middletown, Conn.

No. 14. "Stop Thief" Scale.
Given for One Subscriber.

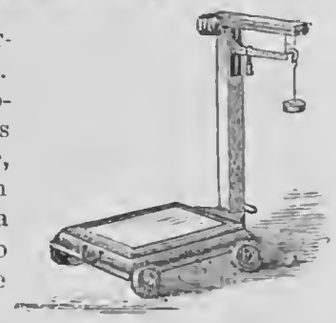


This scale will weigh from ½ oz. to 10 lbs., and is one of the most popular premiums we have ever offered. It retails for $1.15, and is worth it.

No. 15.

UNIVERSAL OR FAMILY SCALE. Given for six subscribers. Weighs from ½ oz. to 240 lbs., and is fully warranted. Price $10.

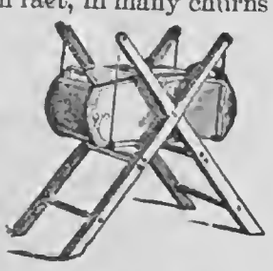
No. 16.
PORTABLE PLATFORM SCALE. Given for 20 subscribers. This has a sliding poise, is mounted on wheels, and has a capacity of ¼ to 800 lbs. Price $22.50.



These three styles of scales, as shown above, are selected with special reference to the tastes and wants of our friends. We get them of the manufacturer, Jones of Binghamton, Binghamton, N. Y., whose reputation as a maker of true and reliable scales is well established.

No. 17. The Davis Swing Churn
Given for Ten Subscribers.

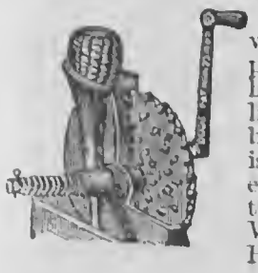
It is now a conceded fact that floats and paddles are not essential to the successful working of a churn. In fact, in many churns they have a tendency to break grain, and no matter how good the flavor, butter can not be gilt-edged, and bring a gilt-edged price without a perfect grain. We have used the Davis Swing Churn for several years, and have been well pleased with its working. It churns quickly, works easily, and the butter comes in a granular form and in fine condition for washing and salting; and then the women like it because it is so easily washed and kept clean. We will give a No. 3 churn, capacity eight gallons of cream, price $10, for 10 subscribers.



No. 18. Challenge Cross-Cut Saw-set and Jointer.
Given for One New Subscriber.

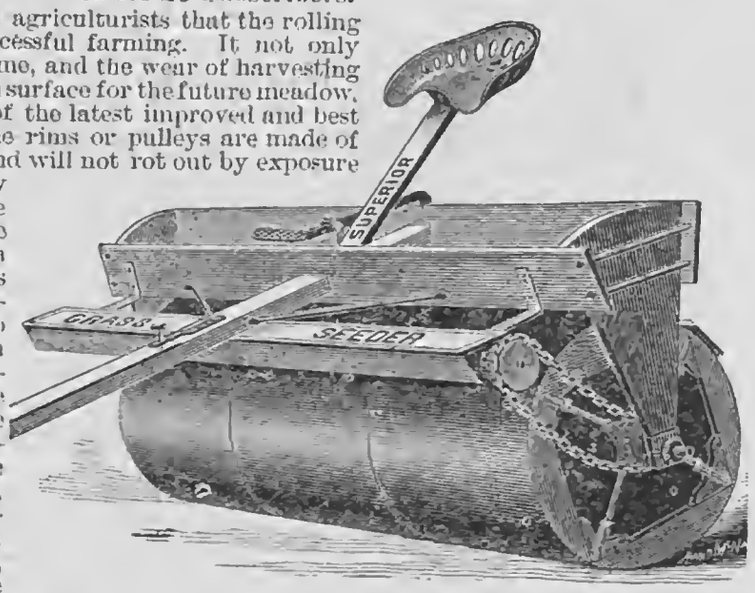
Every man who uses a cross-cut saw is liable to have more or less mishaps in the way of getting it caught and the set taken out, and he should be prepared to set, joint and file his saw even in the woods. The most difficulty in keeping a saw in order, is in jointing it accurately. In the Challenge, we have a combined tool, one of which is a reliable jointer. It does work with ease and accuracy. It is made of the finest of annealed steels, is of convenient size to carry, is strong, simple and durable. Its principle of setting gives any desired amount of set, and sets every tooth exactly alike, thus keeping the teeth in a straight line. Another nice feature is a rubber cushion against which the points of the teeth come and which effectually prevents their being dulled in the setting. It is but little larger than an ordinary pocket knife, and yet it is strong and will do the work. No person who owns a cross-cut saw could afford to be without it if it cost three times its price. It is made by the Challenge Saw-set Co., Meadville, Pa. Price $1. This tool was used as a premium last year and gave such universal satisfaction that we gladly place it upon our list this year. It will please you. Valuable printed instructions for jointing, setting and filing saws sent with each set.

No. 19. Wood's Patent Corn Sheller.
Given for Three Subscribers.



There are many reasons why every farmer and poultry raiser should have one of these handy little shellers. It takes but little power to run it; is simple, durable and effective. It is made by the Lehigh Valley Emery Wheel Co., Lehightou, Pa. Price $3.

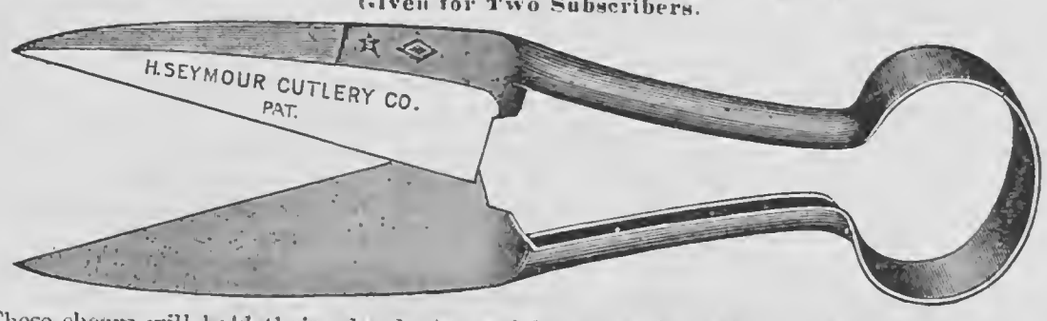
No. 20. The Superior Land Roller.
Given for 25 Subscribers.



It is admitted by most good agriculturists that the rolling of land is indispensable to successful farming. It not only increases the crops but saves time, and the wear of harvesting machinery, by leaving a smooth surface for the future meadow. The above cut represents one of the latest improved and best land rollers in the market. The rims or pulleys are made of the Best Boiler Iron or Steel, and will not rot out by exposure like those made partly or entirely of wood, or break by rough usage as is apt to be the case with those of cast iron. Oak felloes kept in position by iron corner blocks into which the spokes are inserted at their outer end keep the pulley rims tight and in shape. For the purpose of tightening the felloes if at any time found necessary the spokes are threaded and supplied with locking nuts. The arbors are made from the best rolled shafting, carefully straightened and machine turned at the bearings. The journal boxes are self-oiling, a new and very valuable feature in implements of this kind; one oiling being sufficient for weeks of constant use.

They are made in two sizes, viz.: The Three-Section (the popular size) which is 24 inches in diameter by 6 feet in length, weighing about 600 pounds, price $35; and the Four-Section, 24 inches in diameter by 8 feet in length, weighing about 750 pounds, price $40. They are built with stone or weight boxes, by means of which extra weight may be added if desired. An easy spring seat adds to the many attractions possessed by the Superior. When not in use the Roller can be easily and quickly taken apart and stored in a loft or other convenient place. We have made such arrangements as enable us to offer one of the Three-Section Rollers for 25 subscribers which is a splendid opportunity for any one who needs a first-class land roller. They are made by the Gouveneur Machine Co., Gouveneur, N. Y., who will gladly mail circulars to all who apply.

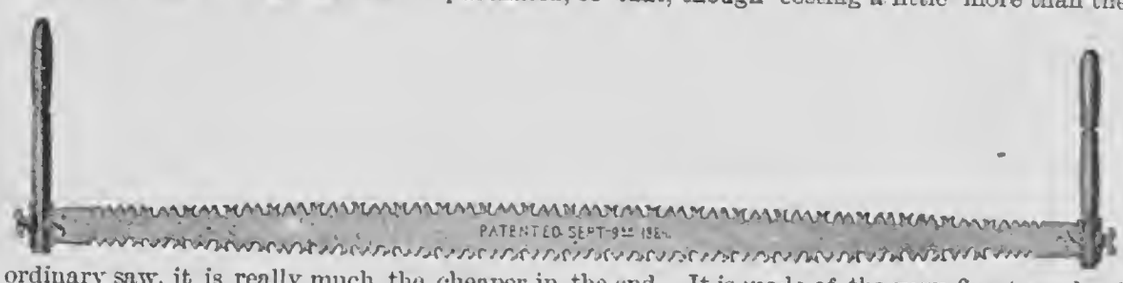
No. 21. Seymour's Diamond Edge Sheep Shears.
Given for Two Subscribers.



These shears will hold their edge better and longer without sharpening than any we have ever tried. The spring and handles are made of the best spring steel and the blades from the best cast steel, and we think no sheep shears yet made will compare with them for cutting qualities. Aside from their use for sheep shearing we have found nothing equal to them for trimming the edges of flower beds and lawns, where a scythe or lawn mower cannot be used. The price varies, according to length of blade, from $1.25 to $2 per pair. Send to the H. Seymour Cutlery Company, Holyoke, Mass., for a pair, or get us two subscribers, and we will send you a pair, either five, five and a half or six-inch blade, as you may prefer.

No. 22. Emerson's Patent Double Cross-cut Saw, Narrow Blade.
Given for Two New Subscribers.

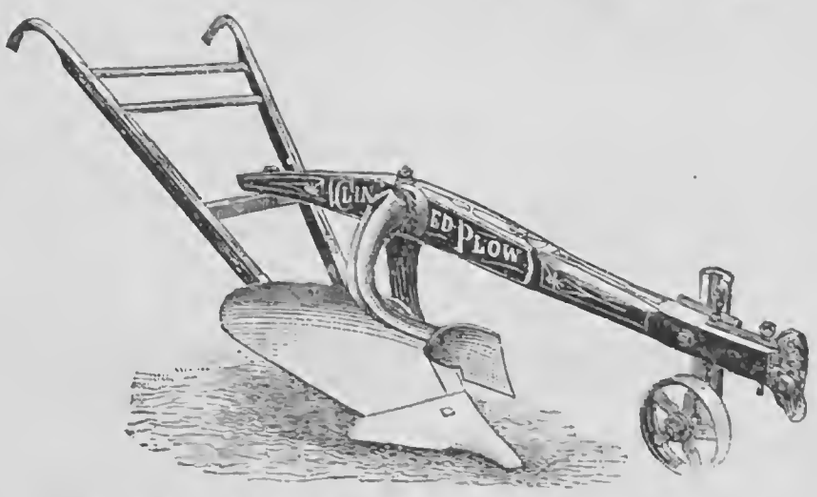
This is something new in cross cut saws, two saws in one; two sets of teeth worn out before the saw is gone. No more gumming of saws and breaking of teeth. This saw, as seen, has teeth on both edges, both sets are filed ready for use, but only one is set ready for use. When the side in use is worn out, the set is to be hammered out of that side; the others set, and you have a new saw. All who have used a cross cut saw know that when it once needs gumming, its best days are over, as one is very seldom made to work well afterwards. In the Emerson, both sets of teeth are made when the saw is purchased, so that, though costing a little more than the



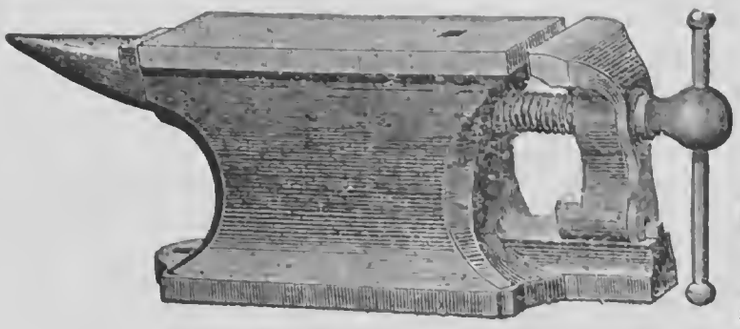
ordinary saw, it is really much the cheaper in the end. It is made of the very finest grade of silver steel, and is heated, in working and in tempering by natural gas, which contains no sulphur or other base properties so injurious to steel; therefore all tools made with this fuel are much tougher and of more even quality than by any other method. Each one of these saws is furnished with adjustable handles, with which it can be used in any position; as well for cutting down trees as for sawing those that are down. Made by Emerson, Smith & Co., Limited, Beaver Falls, Pa., who publish annually a Hand Book for Sawyers containing a large amount of valuable information; the book will be sent free to any part of the world by them on receipt of full name and address.

No. 23. The Clinton-Chilled Plow with Patent Jointer.
Given for Ten Subscribers.

The great novelty and superiority of this plow consist in the crooked jointer arm which passes out over the furrow in such a way that grass, weeds or manure passing over the jointer and up the arm are caught and buried by the turning furrow. We have them in use and can recommend them to do what is claimed. Made by D. Woodward, Clinton, Mich. Price, com-



plete, $14, or jointer alone, $3. We will give the jointer alone fitted for use on any plow, for three subscribers. If you have never used one of these jointers, you should by all means secure one, and you will take solid comfort in using it.



No. 24.
Farmers' Anvil and Vise.
Given for Four Subscribers.

Here is a chance to get one cheap; do not miss it. Manufactured by the Richardson Manufacturing Co., Worcester, Mass. Don't spend an hour or two running to a blacksmith shop to have a small job done when you can do it just as well yourself if you have the proper tools. Every farmer should have an anvil and vise.

No. 25. Farm Bell.
Given for Two Subscribers.

Every farmer should have a good farm bell, if for nothing else but the luxury of hearing its welcome tones at meal time. It is a great safeguard against thieves or tramps, a few taps being usually sufficient to drive the boldest tramp away and to call the men folks. In case of fire it may be used to alarm the neighborhood, and many dollars worth of valuable property may be saved thereby. These bells are made of the best material and are covered with a rich and durable gold bronze. The hangings are coated with an indestructible varnish, preventing rust. The No. 2 weighs 50 pounds, is 17 inches in diameter, and the regular price is $5. Send to Bell & Co., Hillsboro, Ohio, for a descriptive circular.

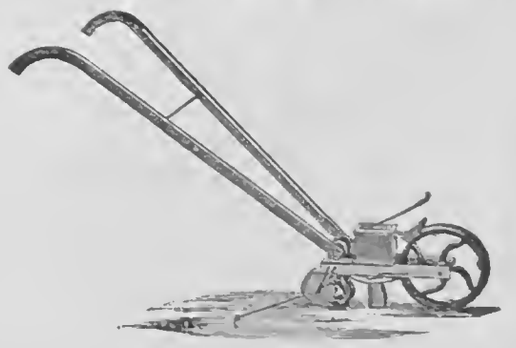
No. 26. The Wilson One and Two Horse Spring Whiffletrees.
Given for two and three Subscribers.

These whiffletrees do away with the severe shock that the shoulders of the horse would otherwise receive in pulling and starting heavy loads, so that he labors with ease and comfort. The importance of this can hardly be overestimated. When the plow strikes a stone, or if the wagon comes against any obstruction or drops into a deep rut, the blow that comes against the horses shoulder is enough to crush it. The wonder is, not that so many horses are lame with shoulder troubles, but that all are not. These severe shocks may all be obviated and nine-tenths of the suffering and lameness prevented, by the use of the Wilson

Spring whiffletrees. We have had them in use and unqualifiedly recommend them to the notice of every horse user. While lighter than the old rigid tree, they are so strong that the most powerful team cannot break them. The above cut shows their construction. The coiled steel spring sustains the draft and equalizes every strain, and the brace rods running to the end make them very strong. They are sold by Jerome Potter, Tiverton Four Corners, R. I. They are made in three sizes, and we will give a pair of the No. 3 size, worth $3,25 or the No. 2, worth $5.10, for three subscribers. No. 1, worth $3, for two subscribers. The smallest size is large enough for ordinary horses.

No. 27. A. H. Matthew's Little Gem Seed Drill.
Given for Six Subscribers

There are thousands of people who still plant their seeds by hand, in the clumsy, old-fashioned way, because they haven't use enough for a drill to afford to pay $10 or $12



for one. This drill is designed for just such people. It is a low-priced, reliable Seed drill that will make the drill, drop and cover the seeds, and mark the next row. Price only $6. Manufactured by Small & Matthews, Boston, Mass.

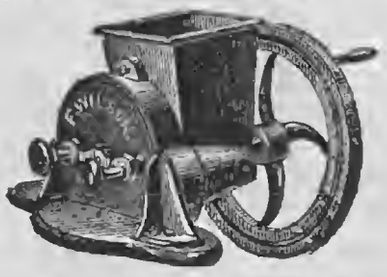
No. 28. Small's Calf Feeder.
Given for Two Subscribers.

This invention feeds the milk to the calf in nature's own way. Its merits and usefulness

will be apparent to every farmer who feeds or handles young calves. Price $2 50. Made by Small & Matthews, Boston, Mass.

No. 29. Frank Wilson's Hand Bone Mill.
Given for Four Subscribers.

We used to pound our bones or shells with a home-made pounder, a piece of log on a broom handle. It was hard work and a large proportion of the shells and bones were only partially broken up, or pounded into the ground. These little mills have saved us money and made the work easier. These mills are a complete success for crushing oyster shells, grinding bones and all kinds of grain including



corn and cob. It will grind a peck of shells, or bones, in from 12 to 15 minutes. Whole oyster shells can be put in the mill as well as bones of the same size. It is adjustable grinding either course or fine. The smaller mill without legs weighs 35 pounds and is sold at the astonishingly low price of $5. It will pay you to get one of these mills and hire a boy to gather up the old bones about your place and grind them up for poultry. For further particulars address, Wilson Bros., Easton, Penn.

Owing to a special arrangement with the manufacturers, we will send one of these mills, to any person sending us four subscribers. This is one of the best.

No. 30. Hill's Combined Truck and Step Ladder.
Given for Three Subscribers.

The above cuts represent a combined Step Ladder and Truck for stores, mills, hotels and farms. It is strong, light, well-made, easily handled, and very simple in construction. The ladder is locked when open by the V-shaped locking device or foot, which makes it

very strong, safe and secure. It has more valuable features than can be shown on paper, and cannot fail to give entire satisfaction. Weighs 18 to 20 pounds each; carries 600 to 800 pounds; made of best second-growth ash, malleable and wrought iron. The wood wheels are made of guarly walnut. Price for Truck, walnut wheels, $4; do. iron wheels, $5. Made by James Hill, 47 Hanover Street, Wilkesbarre, Pa.

No. 31. Macomber's Corn Planter.
For One New Subscriber.

Last year this best of corn planters was offered for *three* subscribers. This season, by a special arrangement, it is offered for *one*. So popular has this useful implement become

that the sale of them is limited only by the capacity of the manufactory. Their simplicity recommends them, their durability makes them economical, and their labor-saving makes them indispensible. Made by S. M. Macomber & Co., Grand Isle, Vt., Price $3.50.

No. 32. The Schiedler Post Hole Digger.
Given for Two Subscribers.

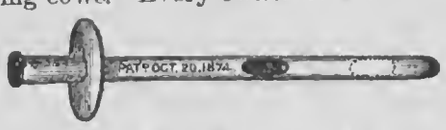
This implement makes a hole of any desired size or depth, and works successfully in all kinds of soil—clay, stony, slate, quicksand or hardpan.

The cut to the left shows the digger in position for work. One shovel only is used in digging, which gives it a decided advantage for fast digging in hard soil over any of the class of diggers that have two shovels, and both are used.

In sandy or gravelly soil, where others usually fail, this digger works with perfect success, owing chiefly to the effective position in which the two shovels can be placed for lifting the soil from the hole. Myers, Housel & Co., manufacturers, Canton, Ohio, U. S. A.

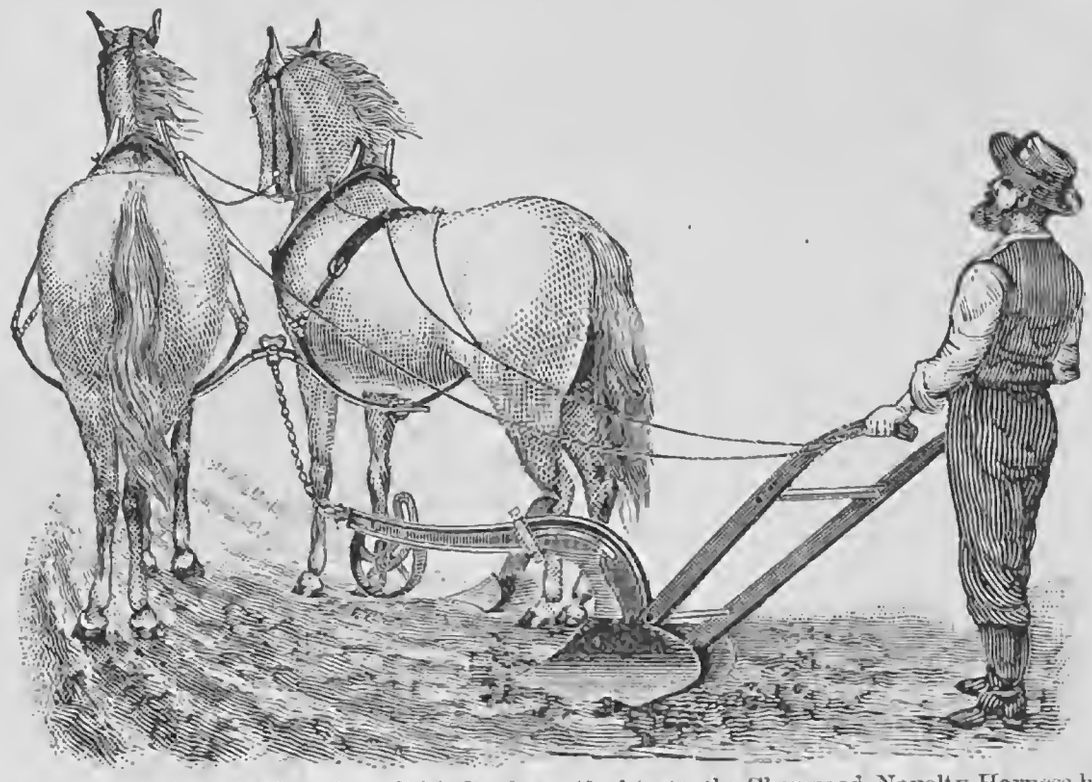
No. 33. Pilling's Patent Coin Silver Milking Tube.
Given for Two Subscribers.

For sore and obstructed teats and hard-milking cows. Every owner of a cow should



have a set of these tubes. Price $2 per set, or 50c. each. Furnished by George P. Pilling, 101 S. Tenth street, Philadelphia, Pa.

No. 34. Sherwood Novelty Harness.
Given for Ten Subscribers.



After having been subjected to all kinds of practical tests, the Sherwood Novelty Harness has proven to be just what it is represented, and it stands before the people to-day as the best harness for practical farm work in the market.

The following endorsement, coming from the editor of the Farm Implement News, is very decided, and is only one of many such which have been given. In speaking of the harness the editor says:

"Having witnessed the use of the Sherwood Novelty Harness in drawing binder, teaming on the road and other farm work—in fact, having used it myself—I am prepared to endorse the claims made in its favor as an easy, practical and really convenient Farm Harness, besides being very durable. Its advantages should commend it to the trade, and we would advise an agent who wants a novelty of merit to order one of these harness, and before plowing begins. If properly handled and pushed it will have large sales."

We have arranged to offer the harness as a premium for ten subscribers. The price of the harness is $15, and it is made by the Sherwood Harness Company, Syracuse, N. Y.

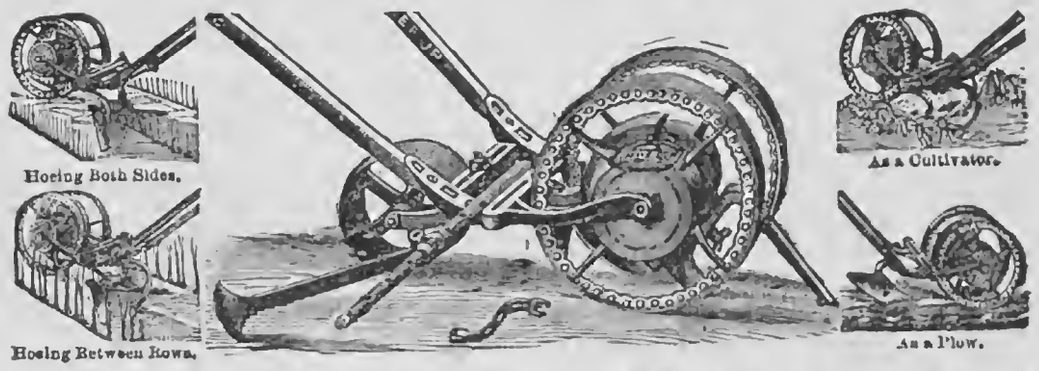
No. 35. The "Fire Fly" Single Wheel Hoe, Cultivator and Plow.
Given for Five Subscribers.

Implements of this kind have done much toward relieving the drudgery of garden cultivation. Running the "Fire Fly" is only a mild form of recreation in comparison with the back-aching and discouraging fight with weeds with the old-fashioned weapons—the fingers and the hoe. The "Fire Fly" Single Wheel Cultivator and Plow is a tool intended for those who have but small gardens and a moderate amount of time to spend in them, and for those who cannot avail themselves of horse-power tools advantageously. It is exceedingly valuable to such persons, since it enables them to economically raise the vegetables necessary for their family, or for market, with a minimum expenditure of labor and time. The work of this little plow is almost equal in thoroughness to that of an ordinary horse cultivator. Price $4.50. Made by S. L. Allen & Co., Philadelphia, Pa.

No. 36. The Planet Jr. Combined Horse Hoe, Cultivator, &c.
Given for Thirteen Subscribers.

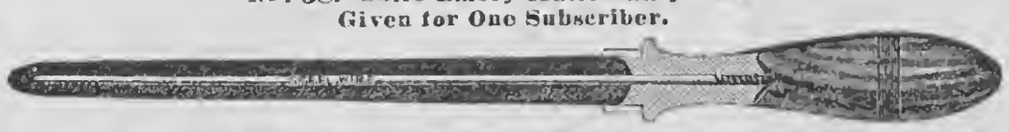
Like the other "Planet Jr." tools this implement is too well known to require any description. We know it will please those who have occasion to use it. Those who try to do garden work without an implement of this kind are sure to regret it. It is well shown in the cut. We are able to offer these implements on very liberal terms this year, and our agents should be able to secure them without much effort. The price of the Hoe is $13.25. Made by S. L. Allen & Co., Philadelphia, Pa.

No. 37. The Planet Jr. Combined Drill and Cultivator.
Given for Twelve Subscribers.



The "Planet Jr." tools used last year as premiums gave such satisfaction that we are glad to offer them again. The Seed Drill, which we offer on most liberal terms, is one of the most popular tools ever used by gardeners. It can be used as a drill, as a plow and as a cultivator, and in each capacity it does the best of work. Each machine is sent out with the tools, ready for adjustment, as shown in the cut. It is simple, accurate and effective. It will be sure to give satisfaction. Price, $12. Made by S. L. Allen & Co., Philadelphia, Pa.

No. 38. Solid Emery Knife Sharpeners.
Given for One Subscriber.



There is no question but that Emery is the material to sharpen knives with, but the difficulty has been to get it into a convenient and durable shape. This has been accomplished in the sharpener represented in the above cut. It is handy and neat, and at the same time by reason of the wire running through its entire length and the manner of fastening into the handle, it is as strong and durable almost as an old fashioned steel. It is just what you need to keep your knives in order. They are made by Wm. H. Parkin, 13 South Water street, Cleveland, Ohio. You can have your choice between a maplewood and cocobola handle for one new subscriber.

No. 39. The Lamont Combination Razor Strop.
Given for One Subscriber.

The razor strop represented by the above cut is said to be one of the best strops in the market. It is made throughout with only the very best selected material, such as the practical experience of years has satisfied the inventors alone can be used in its construction with a certainty of its standing the test of time. The leather is tanned and prepared especially for this purpose, and nothing but the most perfect sides are used. The strops are made by Tower & Lamont, Rochester, N. Y., who claim the best leather, the best and thickest hone, the best arrangement for stretching and the best support for the rod and handle to be found in any combination strop.

No. 40. Blanchard Churn.
Given for from Six to 12 Subscribers.

This is one of the best churns made. Only the very best material is used in their construction and they are made by skilled workmen in the most perfect manner. By experiments with one of these churns made entirely of glass, it has been demonstrated that the form and motion of the dasher perfectly aerate and agitate the cream, bringing the butter at the

proper time and in the best possible condition. The body of the churn being cylindrical, all the cream is churned alike and at the same time, making streaked butter impossible. Those who desire to make butter on what is called the "granular system" can do it perfectly with the Blanchard churn. Made by Porter Blanchard's Sons, Concord, N. H. Prices from $6 to $12. We will send a No. 7, which will churn 16 gallons; price $12, for 12 subscribers or smaller sizes for from six to ten subscribers.

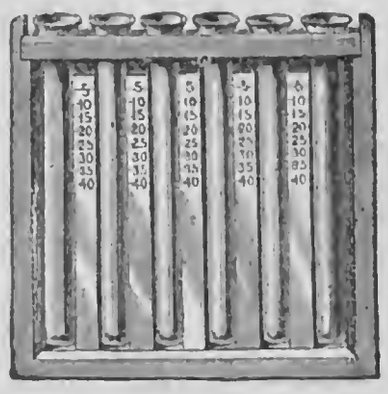
No. 41. Clark's Root Cutter.
Given for Twelve Subscribers.

Dozens of farmers last year wished to secure the Root Cutter, which was offered in our list of presents. They will have an excellent opportunity this year of securing one for compartively little effort.

This machine is one of the very best. It is well made, strong and cuts the roots into pieces half round, the best possible shape for feeding, as they cannot pack down in the feeding dish. It will easily cut one bushel per minute, and every one who feeds roots or apples to stock should have one. Made by the Higganum Manufacturing Corporation, Higganum, Conn. Price, $14.

No. 42. Cream Tester.
For One New Subscriber.

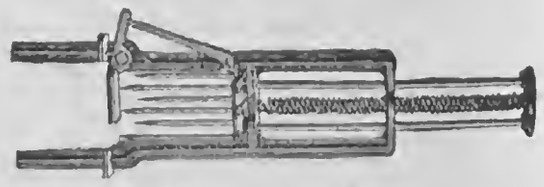
The plan adopted by the most successful dairymen of testing the milk of each cow in their herd has led to the introduction of the



cream tester. The one here offered is practical, economical and accurate. It is made and sold by Wymon L. Edson, Union Centre, Broome Co., N. Y. Price of 6-glass cream tester, $1, postpaid. Send for a circular.

No. 43. Olmstead Reliable Mole Trap.
Given for Two Subscribers.

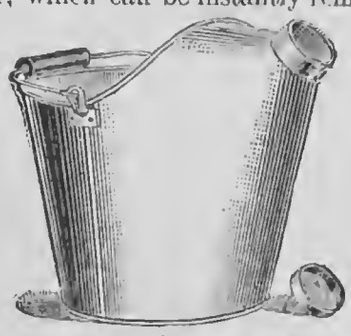
We have noticed that but a small proportion of the damage done by moles is attributed to them. They destroy seed and growing potatoes eat seed corn, and undermine and destroy young vegetables of all kinds. They are an



intolerable nuisance to be destroyed in the quickest and most effectual way. This trap will catch and kill them and every one of our readers should have one. Price $1.65. Sold by L. H. Olmstead, Corona, N. J. Given for two subscribers.

No. 44. The "Common Sense" Milk Pail.
Given for Two Subscribers.

This is the nearest approach to a perfect milk pail we have ever seen. It protects the milk. There are no seams in the front to catch the dirt. It has a perfectly fitting strainer, which can be instantly removed, so



that every part of the pail may be quickly and thoroughly cleaned. It is well made of heavy XX tin, and we know our dairy readers would not be without it if they thoroughly understood its merits.

No. 45. Milking Tubes, for Milking Cows with Sore Teats.
A Full Set sent for only One Subscriber.

If a cow's teat becomes injured or sore, or in any way obstructed, to draw the milk by hand from such a teat is very painful to the

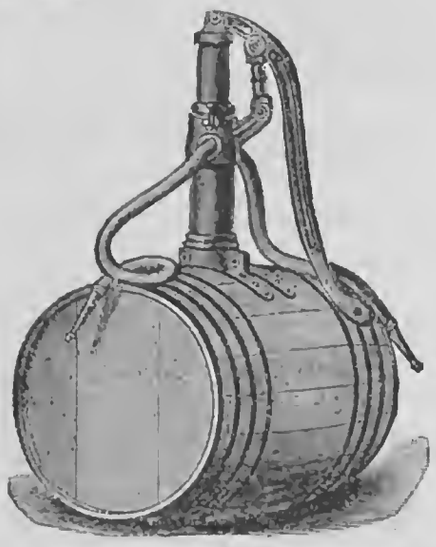
cow and vexatious to the milker. In such a case, with one of these milking tubes, the milk can be taken so easily that both the cow and the owner will enjoy the operation. Every farmer should have one of these sets. The Pail and Milking Tubes are supplied by Messrs. Bartlett & Dow, Lowell, Mass.

No. 46. Pearce's Improved Cahoon's Patent Broad-cast Seed Sower.
Given for Four Subscribers.

This machine sows wheat and heavy grain two rods wide, so a man can sow four acres by walking a mile. It sows all kinds of grain and cleaned grass seed, and does better work than can be done in any other way. Four to eight acres can be sown in an hour at a common walking gait. It saves both in labor and seed. Simple in construction and easily regulated. Price $5. Made by the Godell Company, Antrim, N. H., who also make a horse-power seed sower.

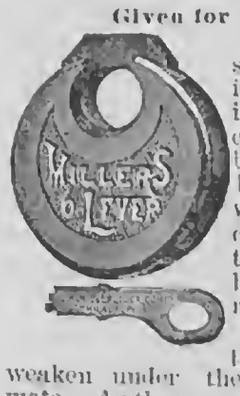
No. 47. Double Acting Force Pump.
Given for Eleven Subscribers.

It is needless to speak of the value of a good force pump to the orchardist or planter. The Goulds' Force Pumps, shown in the cut, have given the most complete satisfaction. For throwing poisons or liquids of any kind over trees and shrubs they have been used with excellent effect.



The pumps are made with brackets or feet, that will fit an ordinary barrel capable of holding 40 to 50 gallons of water. This barrel can be placed on a wagon and drawn through the orchard or garden. With one of the pumps attached, a stream of water may be directed from one or both sides, as may be desired. The dimensions of the pumps offered are: Outer cylinder, 1¼ inch; hose discharge, ¾ inch; pipe discharge, ½ inch. The piston and smaller cylinder are made of brass and the outer cylinder is iron. Price, $10 50. Made by the Goulds Manufacturing Co., Seneca Falls, N. Y.

No. 48. "Champion" Six-Lever, Self-Locking Padlocks.
Given for One Subscriber.



In order that a padlock shall be good for anything it must be strong and lasting, and have a lock which cannot be picked by everybody with a tenpenny nail. The "Champion," which we offer for a premium, combines to a large degree the essentials of a good padlock, and we confidently recommend it.

The springs are of phosphor-bronze, not liable to weaken under the influence of any climate. As the name implies, this lock has six levers or tumblers, and is so constructed by elaborate machinery that no two of them can be opened by the same key unless they have been made alike to order. The Miller Lock Company, 821 Cherry Street, Philadelphia, are sole manufacturers. They will furnish price lists, etc., on application.

No. 49. The McCreary Patent Dog and Sheep Power.
Given for Ten Subscribers.

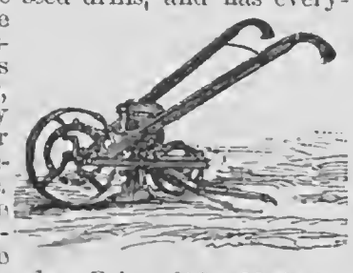
How common it is to see a great big dog lazily following the horses or dozing under the trees, doing little else but eating food which could be fed with advantage to the hogs or the chickens, while the farmer's wife and children are worrying away with the churn, sweating and fretting because the butter will not come. It is a farmer's duty to utilize all available forces, and he should stop a very common waste by getting a good dog power and making the dog earn his living, to the relief of the already overworked wife or child. These powers can be worked by a sheep as well as by a dog. There is no reason why the old ram should not expend his surplus energy in a useful manner in one of these powers.

The McCreary Dog and Sheep Power is adapted for farm and dairy use, and is the lightest running power made. A 25 pound dog or sheep will churn five gallons of cream, and a larger animal will churn proportionately more.

This power is a horizontal rotary platform, 54 inches in diameter, and working on a friction wheel, which gives an easy, steady motion, without any jar or jerking. The platform is adjustable to any angle to suit the weight of the dog, and also regulate the speed, a very desirable feature when wishing to run the churn slow to "gather" the butter. The change can be made while the machine is running. The machine occupies 4x4½ feet floor space; is made strong and durable. With ordinary care it will last a life-time, as there is nothing to wear out, and it is so simple it cannot get out of order. Price, $15. Manufactured by Logan & Strobridge, New Brighton, Pa. *The R. N.-Y. never sells any premiums.*

No. 50. New York Seed Drill.
Given for Ten Subscribers.

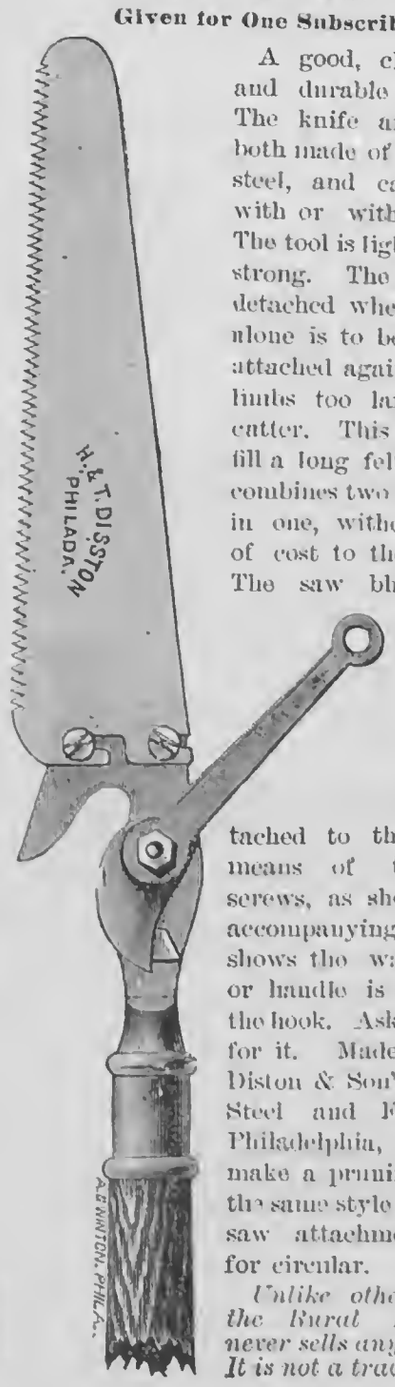
This is one of the oldest and most thoroughly tested of all the seed drills, and has everywhere given the most perfect satisfaction. It is simple, strong, durable; a very accurate dropper and easy to operate and manage. The name of the makers is a sufficient guarantee that it is well made. Price, $12. Made by the Higganum Manufacturing Corporation. Higganum, Conn.



No. 51. The Granger Fruit and Vegetable Evaporator.
Given for Three Subscribers.

This evaporator is especially adapted for family use. It can be used on the kitchen stove, with no extra expense for fuel. Its action is uniform and steady, it never scorches or burns, requires no watching, and produces beautiful, clean, tender and palatable evaporated fruit in from two to three hours. No farmer should be without one. It will pay for itself in a few days. The price varies according to size from $3,50 to $10. We will give a No. 1 18x26 inches price $3,50 for only three subscribers. For circulars address Eastern Manf'g Co., 268 South Fifth Street Philadelphia Pa.

No. 52. Disston's Little Giant Pruning Hook and Saw.
Given for One Subscriber.

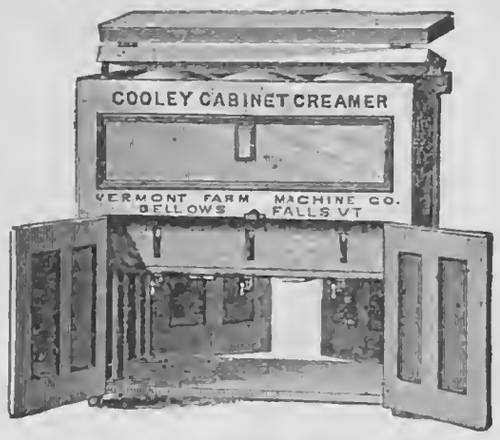


A good, cheap, simple and durable implement. The knife and saw are both made of the best cast steel, and can be used with or without a pole. The tool is light and very strong. The saw can be detached when the hook alone is to be used, and attached again for use on limbs too large for the cutter. This pruner will fill a long felt need, as it combines two useful tools in one, without increase of cost to the consumer. The saw blade is attached to the hook by means of two clamp screws, as shown in the accompanying cut; it also shows the way the pole or handle is attached to the hook. Ask your dealer for it. Made by Henry Diston & Son's Saw, Tool, Steel and File Works, Philadelphia, who also make a pruning hook of the same style without the saw attachment. Send for circular.

Unlike other journals, the Rural New-Yorker never sells any premiums. It is not a trade journal.

No. 53. Cooley Cabinet Creamer.
Given for Thirty-three Subscribers.

Experiments demonstrate the fact that the use of a creamer and cold water or ice raises the cream more perfectly than any other method. In a recent test made by Dr. Babcock, of the New York Experiment Station, with a Cooley Creamer, less than one-tenth of one per cent was left in the skim milk. In the



Cooley the cans containing the milk are entirely submerged and water-sealed, which is claimed to greatly increase the cooling surface, and the water is said to absorb all gases or bad odors, and the cream is not affected by thunder or sudden changes of temperature. We will present a No. 1 Cooley Cabinet Creamer, having three cans and large enough to accommodate the milk of from six to nine cows. Price, $33, for thirty-three subscribers.

No. 54. Eureka Butter Worker.
Given for 10 Subscribers.

When butter has to be worked with the ladle and bowl it is very hard work, and the temptation is great to no more than half do it, and the danger of spoiling the grain is also great. The Eureka worker obviates both these objections. It frees the butter from the buttermilk by pressure and in the easiest manner and quickest time and with no danger to the grain. It is strong, durable, and simple and easily kept clean. We will give a No. 3 Eureka, capacity sufficient for any farmer, price $10,00 for 10 subscribers.

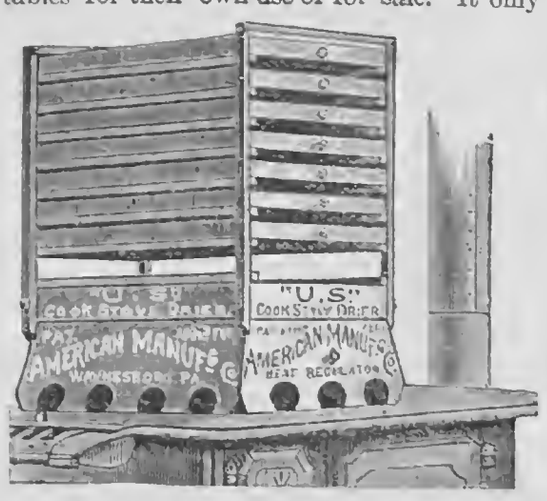
No. 55. Nesbit Butter Printer.
Given for Six Subscribers.

However good the butter may be, appearance has much to do with its price and ready sale. This very convenient little machine puts the butter in a neat, rectangular or brick form, does it easily and quickly, and if the block is carved with two designs the brick can be cut into two equal-sized pieces. This is a very convenient machine, and we shall give a one pound self-gauging press, worth $5.50 for six subscribers.

The Vermont Farm Machine Company, who make the above-mentioned articles, are, perhaps, the most extensive manufacturers of dairy apparatus in the world, and their name is a guaranty of careful manufacture out of the best material.

No. 56. U. S. Cook Stove Drier.
Given For Five Subscribers.

There are thousands of careful prudent household managers who have no time nor necessity to engage in evaporating fruit for market as a business, but who have frequent use for just such an article as this for making smaller quantities of dried fruits, berries and vegetables for their own use or for sale. It only



weighs 20 pounds; has eight reversible interchangeable galvanized wire-cloth trays, which will not rust or discolor the fruit &c., and will last for years. It is made of galvanized iron, except tray frames and supports. Can be used for broiling beef steak, fish, &c. Its capacity is ample for domestic purposes and it is always ready for immediate use. Price, seven dollars, made by the American M'f'g Co., Waynesboro, Pa., manufacturers of the American Evaporator.

No. 57. Matthewson's Steel Name Stamps.
Given for Two New Subscribers.

The custom of borrowing is the cause of much ill-feeling between neighbors. A large part of this trouble would be obviated if every farmer stamped his implements so they could be identified beyond all question. We will send a Steel Name Stamp, letters not to exceed 10 in number, one eighth of an inch in length, for two new subscribers. Send to J. E. Matthewson, Springfield, Mass., for a catalogue. In ordering, please state whether the stamps are to be used on wood or metal.

No. 58. Manner's Improved Bench Drill.
Given for Five Subscribers.

This tool is just the thing for a farmer with sufficient skill to keep his own implements in repair. The total hight is about 24 inches, weight 31 pounds and it will drill a hole from the smallest to ¾ of an inch true and square, with bed plate. The rim of the screw is 3½ inches. A Chuck is fitted to each machine to fit Morse Square Shank Twist Drills, which can be bought in any hardware store. The list price of this drill is $12, but it is sold at the very low price of $4,50, by the Manner Drill Co., Rochester, N. Y.

The same firm makes a Machinists' Vise. width of jaw 3½ inches; opens 4 inches; steel jaws; wrought forged screw; square cut thread. List price, $4.50.

This vise will be sent for two subscribers.

No. 59. Goodell's "White Mountain" Potato Parer.
Given for One Subscriber.

This machine does good work—much better than can be done by hand—going into and cleaning out the eyes, and saving at least twenty-five per cent.

It is free from the objections made to all styles of geared parers, is good in every respect, and so cheap as to be within the means of everybody. It will pare quinces or pears equally as well as potatoes. The Alford & Berkele Company, New York.

No. 60. Trio of Excelsior Plymouth Rock Fowls.
Given for Ten Subscribers.

While the newer varieties come and go the "Rocks maintain their position as one of the leading all-purpose fowls for the farmer and poultry raiser. Scudder & Townsend of Glen Heads N. Y., make a speciality of breeding fowls for farmers. At the New York Poultry Show Messrs. Scudder & Townsend won first prize on P. Rock Breeding Pen and we have accordingly selected their fowls as being the best obtainable. These birds will not be culls or second-class specimens. They will be first-class in every respect. Scudder and Townsend cannot afford to send out poor birds. The pullets will weigh from six to seven pounds and the male from eight to nine pounds. We will give a trio of first-class thoroughbred Excelsior Plymouth Rocks for ten subscribers.

PLANTS, SEEDS AND VINES.

No. 61. Golden Queen Raspberry.
Nine Plants for One Subscriber.

This is a seedling or sport of the celebrated Cuthbert, and is of a rich, bright, creamy yellow, and this color it holds well when in the crate. In size, vigor, productiveness, beauty and hardiness it is superior to the Cuthbert. In season of ripening it is the same. It also endures heat and drought as well as or better than the Cuthbert. Every fruit grower should have this berry for its beauty as well as good qualities. It will be sent by J. T. Lovett, Little Silver, N. J. Price $3 per dozen. We will send nine plants, postpaid, for a single subscriber. This is a better offer than we made last year, and the berry has greatly improved its standing since then.

No. 62. Rancocas Raspberry Plants.
Given for One Subscriber.

With another year's trial, the Rancocas Raspberry stands better than ever. It last Winter endured the extreme trial of the cold better then than anything else at the Rural Grounds. It is more than a week earlier than Cuthbert, and ripens its crop in a short time after the first picking. Color a bright red; bush very stout and branching. R. G. Chase & Co., nurserymen of Philadelphia, Geneva and Boston, again kindly enable us to give one dozen plants of the Rancocas, worth $2, for one subscriber.

No. 63. Moore's Early Grape.
Three Vines for One Subscriber.

This is one of the healthiest and most vigorous growers of the grape tribe, and, withal, the earliest of the eatable black grapes. Joel Horner & Son, of Merchantville, N. J., the reliable nursery firm, who pride themselves on sending out good goods, and warrant them strictly true to name, have placed a few at our disposal and we will give three one year old vines for one subscriber.

No. 64. Jewell Strawberry Plants.
One Dozen for One Subscriber.
